Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write

brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a week and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Order medications as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Pre-Service intensity/complexity	3.50	3.00
Intra-Service intensity/complexity	3.63	3.25
Post-Service intensity/complexity	2.88	2.63

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 22900 (Excision, abdominal wall tumor, subfascial (eg, desmoid)) will be deleted in 2010 and replaced by two new codes (P21 and P22). During the Harvard study, 14 general surgeons were surveyed. The data that included hospital work was truncated by the RUC based on Medicare frequency. The typical patient is not Medicare-age and these patients will typically require a drain and will stay overnight in the hospital for monitoring. Further, without requiring a RUC survey in 1995 during the first 5-year-review, the code was reduced based on a comment letter.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

- Pre-Time: With respect to the pre-service time, we recommend package 3 with no changes.

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW *adjusted* down to 11.65 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.069. The RVW is similar to the reference code 49560, which has less post-op work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

low was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22900

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Excel File for all soft tissue tumor codes will be provided.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:23076 Tracking Number P27 Specialty Society Recommended RVU: **7.28**

Global Period: 090 RUC Recommended RVU: **7.28**

CPT Descriptor: Excision, tumor, soft tissue of shoulder area, subfascial (eg, intramuscular); less than 5 cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 47-year-old female undergoes excision of a 3.5 cm lipoma deep within the subscapularis muscle.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 60% , Kept overnight (less than 24 hours) 37% , Admitted (more than 24 hours) 3%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 92%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with lateral beach chair positioning, exposing the shoulder and stabilizing the patient's torso. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the anterior shoulder following the delto-pectoral groove. The subcutaneous tissue is incised and the cephalic vein is identified and dissected up to the coracoid process. The pectoralis major tendon inserting in the humerus is retracted. A retractor is placed under the deltoid to expose the proximal humerus. The pectoral fascia is incised and retracted medially and laterally. The shoulder is then externally rotated and dissection is performed on the inferior medial portion of the subscapularis muscle so a retractor could be gently inserted to protect the axillary nerve where it comes across the inferior portion of the wound. The shoulder is externally rotated the subscapularis insertion on the anterior shoulder is identified and a retractor is used to retract the conjoined tendon medially. The mass is able to be palpated just under the conjoined tendon both medial to it and lateral to it. With retractors medially holding the conjoined tendon, a horizontal split is made in the subscapularis muscle. This dissection is carried down until the tumor is encountered. The conjoined tendon is protected. Dissection is performed on both sides of the tendon. The musculocutaneus nerve is identified and protected. With the split in the subscapularis muscle accomplished, the lipoma is dissected out in one piece and handed out of the operative field. Retractors are used within the subscapularis to hold both the superior and inferior portions of it in place. The thoracoacromial arch is

avoided during the surgery to minimize bleeding in the superior portion of the wound. The wound is irrigated. Instruments and gloves are then changed. The cavity in the subscapularis is carefully inspected and there is found to be no residual tumor. A deep drain is placed within the subscapularis and brought out the anterior skin flap. The defect in the sub-scapularis is closed with an interrupted suture. Since the conjoined tendon is left in place. The musculocutaneu nerve entering medial side of the biceps is inspected and found to be intact. The retractors protecting the inferior porti of the subscapularis are removed. The retractor holding back the cephalic vein is also removed. The wound is closed in layers.

Description of Post-Service Work: Apply sterile dressings and shoulder immobilizer. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for several more visits through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 23076 (Excision, soft tissue tumor, shoulder area; deep, subfascial, or intramuscular) will be deleted in 2010 and replaced by two new codes (P27 and P28). During the Harvard study, 13 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. The current survey, which includes general surgeons results in different time and visit data.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, the patient will be repositioned in beach chair and slightly lateral to expose the shoulder and stabilize the patient's torso.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 7.28 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.046. This RVW is slightly greater than the 10-day global reference code, accounting for additional intra-op time and post-op work and is less than the current RVW for 23076.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlist code is reviewed) 23076

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Excel File for all soft tissue tumor codes will be provided.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

)o many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:23073 Tracking Number P28 Specialty Society Recommended RVU: **10.93**

Global Period: 090 RUC Recommended RVU: **10.00**

CPT Descriptor: Excision, tumor, soft tissue of shoulder area, subfascial (eg, intramuscular); 5 cm or greater

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 47-year-old female undergoes excision of a 7.5 cm lipoma deep within the subscapularis muscle.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 6% , Kept overnight (less than 24 hours) 69% , Admitted (more than 24 hours) 26%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 92%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with lateral beach chair positioning, exposing the shoulder and stabilizing the patient's torso. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the anterior shoulder following the delto-pectoral groove. The subcutaneous tissue is incised and the cephalic vein is identified and dissected up to the coracoid process. The pectoralis major tendon inserting in the humerus is retracted. A retractor is placed under the deltoid to expose the proximal humerus. The pectoral fascia is incised and retracted medially and laterally. The shoulder is then externally rotated and dissection is performed on the inferior medial portion of the subscapularis muscle so a retractor could be gently inserted to protect the axillary nerve where it comes across the inferior portion of the wound. The shoulder is externally rotated the subscapularis insertion on the anterior shoulder is identified and a retractor is used to retract ' conjoined tendon medially. The mass is able to be palpated just under the conjoined tendon both medial to it and late to it. With retractors medially holding the conjoined tendon, a horizontal split is made in the subscapularis muscle. This dissection is carried down until the tumor is encountered. The conjoined tendon is protected. Dissection is performed on both sides of the tendon. The musculocutaneus nerve is identified and protected. With the split in the subscapularis muscle accomplished, the lipoma is dissected out in one piece and handed out of the operative field. Retractors are used

within the subscapularis to hold both the superior and inferior portions of it in place. The thoracoacromial arch is avoided during the surgery to minimize bleeding in the superior portion of the wound. The wound is irrigated. Instruments and gloves are then changed. The cavity in the subscapularis is carefully inspected and there is found to be no residual tumor. A deep drain is placed within the subscapularis and brought out the anterior skin flap. The defect in he sub-scapularis is closed with an interrupted suture. Since the conjoined tendon is left in place. The musculocutaneus nerve entering medial side of the biceps is inspected and found to be intact. The retractors protecting the inferior portion of the subscapularis are removed. The retractor holding back the cephalic vein is also removed. The wound is closed in layers.

Description of Post-Service Work: Apply soft dressings and shoulder immobilizer. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order ccupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.50	3.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.17	3.00
Urgency of medical decision making	3.00	2.83

Technical Skill/Physical Effort (Mean)

Technical skill required	3.00	3.00
Physical effort required	2.67	2.67

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.33	3.00
Outcome depends on the skill and judgment of physician	3.50	3.33
Estimated risk of malpractice suit with poor outcome	2.33	2.33

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.33	2.67
Intra-Service intensity/complexity	3.00	3.17
Post-Service intensity/complexity	2.83	2.83

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 23076 (Excision, soft tissue tumor, shoulder area; deep, subfascial, or intramuscular) will be deleted in 2010 and replaced by two new codes (P27 and P28). During the Harvard study, 13 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. The current survey, which includes general surgeons results in different time and visit data.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, the patient will be repositioned in beach chair and slightly lateral to expose the shoulder and stabilize the patient's torso.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends an RVW that is midway between the survey 25th percentile and median to place this code in correct rank order with the rest of the family of subfacial codes. Additionally, this value has been *adjusted* (decreased) to 10.93 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.061. This is less than the IWPUT for the reference code 29828, which has the same intra-operative time and less total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23076

Vignette Used in Survey: A 57-year-old male undergoes excision of a 3 cm myxoma from between the humerus and triceps.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 67% , Kept overnight (less than 24 hours) 29% , Admitted (more than 24 hours) 5%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 92%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Exsanguinate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A posterior incision is made over the arm and the subcutaneous tissue is split, and the fascia over the triceps muscle is split. Since it is a myxoma, the triceps are retracted to one side and dissected off the posterior portion of the ulnar nerve traveling down the medial portion of the incision. The radial nerve, which is crossing distally in the wound from medial to lateral, is protected. The vessels traveling with the radial nerve are protected. Several perforators off the profunda brachial artery are ligated and incised. Once this interval is freed up, deeper dissection is carried down into the deep triceps and exposure is made over the mass overlying the humerus. The mass is homogenous in consistency and dissection is accomplished by retracting the triceps up off the humerus and taking the mass off of the posterior aspect of the humerus. Superiorly in the wound, some of the vessels and part of the axillary nerve innervating the inferior deltoid are retracted to gain exposure to that portion of the wound. The mass is taken out in one piece. It is inspected intra-operatively and found to be consistent with a myxoma. It is handed off the operative field. The wound is then copiously irrigated. Retractors are removed, protecting both the ulnar nerve

medially and the radial nerve inferiorly in the wound. The tourniquet is let down. Hemostasis is obtained and a drain is placed. A multilayered closure is performed.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. T specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologis coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of a sling. Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for several more visits through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 6 **% of respondents:** 14.2 %

TIME ESTIMATES (Median)	CPT Code: 24076	Key Reference CPT Code: 25109	Source of Time RUC Time
Median Pre-Service Time	68.00	50.00	
Median Intra-Service Time	60.00	40.00	
Median Immediate Post-service Time	20.00	20.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	19.0	19.00	
Median Office Visit Time	62.0	62.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**229.00**	**191.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.50	2.67
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.33	2.67
Urgency of medical decision making	3.00	3.00

Technical Skill/Physical Effort (Mean)

Technical skill required	2.83	2.67
Physical effort required	2.67	2.67

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.83	2.67
Outcome depends on the skill and judgment of physician	2.67	2.67
Estimated risk of malpractice suit with poor outcome	2.83	2.67

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.00	2.50
Intra-Service intensity/complexity	2.67	2.50
Post-Service intensity/complexity	2.67	2.50

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 24076 (Excision, tumor, soft tissue of upper arm or elbow area; deep (subfascial or intramuscular)) will be deleted in 2010 and replaced by two new codes (P36 and P37). During the Harvard study, 13 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted, including no positioning time.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for lateral positioning after induction of anesthesia in supine position.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 7.28 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.043. This is less than the IWPUT for the reference code 25109, which has less intra and total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlist code is reviewed) 24076

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Excel File for all soft tissue tumor codes will be provided.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:24073 Tracking Number P37 Specialty Society Recommended RVU: **11.30**

Global Period: 090 RUC Recommended RVU: **10.00**

CPT Descriptor: Excision, tumor, soft tissue of upper arm or elbow area, subfascial (eg, intramuscular); 5 cm or greater

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 57-year-old male undergoes excision of a 6 cm myxoma from between the humerus and triceps.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 7% , Kept overnight (less than 24 hours) 69% , Admitted (more than 24 hours) 24%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 90%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Exsanguinate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A posterior incision is made over the arm and the subcutaneous tissue is split, and the fascia over the triceps muscle is split. Since it is a myxoma, the triceps are retracted to one side and dissected off the posterior portion of the ulnar nerve traveling down the medial portion of the incision. The radial nerve, which is crossing distally in the wound from medial to lateral, is protected. The vessels traveling with the radial nerve are protected. Several perforators off the profunda brachial artery are ligated and incised. Once this interval is freed up, deeper dissection is carried down into the deep triceps and exposure is made over the mass overlying the humerus. The mass is homogenous in consistency and dissection is accomplished by retracting the triceps up off the humerus and taking the mass off of the posterior aspect of the humerus. Superiorly in the wound, some of the vessels and part of the axillary nerve innervating the inferior deltoid are retracted to gain exposure to that portion of the wound. The mass is taken out in one piece. It is inspected intra-operatively and found to be consistent with a myxoma. It is handed off the operative field. The wound is then copiously irrigated. Retractors are removed, protecting both the ulnar nerve

medially and the radial nerve inferiorly in the wound. The tourniquet is let down. Hemostasis is obtained and a drain is placed. A multilayered closure is performed.

Description of Post-Service Work: Apply soft dressing and sling. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of sling. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 24076 (Excision, tumor, soft tissue of upper arm or elbow area; deep (subfascial or intramuscular)) will be deleted in 2010 and replaced by two new codes (P36 and P37). During the Harvard study, 13 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were poorly predicted, including no positioning time.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for lateral positioning after induction of anesthesia in supine position.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 11.30 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.067. This is similar to the IWPUT for the reference code 25609, which technically more demanding.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Intra-Service intensity/complexity	3.25	2.88
Post-Service intensity/complexity	3.50	3.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 24076 (Excision, tumor, soft tissue of upper arm or elbow area; deep (subfascial or intramuscular)) will be deleted in 2010 and replaced by two new codes (P36 and P37). During the Harvard study, 13 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were poorly predicted, including no positioning time.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for lateral positioning after induction of anesthesia in supine position.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 11.30 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.067. This is similar to the IWPUT for the reference code 25609, which technically more demanding.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:25076 Tracking Number P44 Specialty Society Recommended RVU: **6.61**

Global Period: 090 RUC Recommended RVU: **6.61**

CPT Descriptor: Excision, tumor, soft tissue of forearm and/or wrist area, subfascial (eg, intramuscular); less than 3 cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 43-year-old male undergoes excision of a 2 cm lipoma from the volar compartment of the forearm.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Percent of survey respondents who stated they perform the procedure; In the hospital 95% , In the ASC 0%, In the office 5%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 87% , Kept overnight (less than 24 hours) 9% , Admitted (more than 24 hours) 2%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the tumor. Careful dissection is carried through the subcutaneous tissue and fascia to the tumor taking care to protect any neurovascular structures. The tumor is dissected away from the adjacent tissues and removed. The wound is irrigated. The tourniquet is released and meticulous hemostasis is achieved. The wound is again irrigated. The wound is closed in layers.

Description of Post-Service Work: Apply soft dressing and splint to hold the wrist in neutral alignment. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other

professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of sling. Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, includ discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the r day to assess the wound and neurovascular status and for several more visits through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures and drain; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 25076 (Excision, tumor, soft tissue of forearm and/or wrist area; deep (subfascial or intramuscular)) will be deleted in 2010 and replaced by two new codes (P44 and P45). During the Harvard study, 12 orthopaedic surgeons were surveyed. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 6.61 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.047. This is less than the IWPUT for the reference code 25109, which has slightly less intra-operative time and less total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on the upper arm. Prep and drape the arm. Scrub and gown. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made distal to the flexor crease of the elbow down the volar aspect of the forearm. The subcutaneous tissue is incised and the fascia is split. Care is taken to avoid any of the antebrachial cutaneus nerves of the forearm. The interval between the brachial radialis muscle and the flexor carpi radialis muscle is split. The radial artery on the lateral side of the incision along with the radial sensory nerve are dissected free and retracted laterally. The flexor digitorum sublimis muscle is identified and several perforating vessels off the radial artery are ligated and tied. The lateral aspect of the flexor digitorum sublimis is released and a portion of the distal pronator teres muscle incised and retracted proximally. Next, the flexor digitorum superficialis is retracted toward the ulnar side of the arm. The median nerve and the anterior interosseous nerve and artery are exposed. The anterior interosseous innervation to the flexor digitorum profundus and flexor pollicis longus are identified and protected. A portion of the profundus is longitudinally split to expose the lipoma. The lipoma is deep and just sitting on the ulna and interosseous membrane. The median nerve is carefully protected along with the ulnar artery while splitting the flexor digitorum

profundus. Very careful dissection is necessary to remove this deep lipoma. It is removed off the interosseous membrane as well as off the ulna. The tumor is removed in one piece. The flexor digitorum profundus is then loosely closed with interrupted sutures. The anterior interosseous and medial nerves are carefully inspected. The tourniquet is let down and bleeders are ligated. The flexor digitorum is allowed to gently be put back into place laterally and held with interrupted re-absorbable sutures. A portion of a pronator teres tendon that had been released is repaired with a non-absorbable suture. A drain is placed in this layer and brought out through the skin. The retractors are all removed and the brachial radialis and flexor carpi radialis are allowed to fall back into place. The fascia is left open. The wound is closed in layers.

Description of Post-Service Work: Apply soft dressing and splint to hold the wrist in neutral alignment. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of sling. Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day to assess the open wound and neurovascular status and for several more visits through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures an drain; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	2.60	2.80

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 25076 (Excision, tumor, soft tissue of forearm and/or wrist area; deep (subfascial or intramuscular)) will be deleted in 2010 and replaced by two new codes (P44 and P45). During the Harvard study, 12 orthopaedic surgeons were surveyed. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 8.26 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.062. This is greater than the IWPUT for the reference code 25515, and reflects the more demanding deep excision.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 25076

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the thenar eminence. The subcutaneous tissue is dissected. The thenar fascia is opened. The flexor pollicis brevis muscle fibers are split to expose the tumor. Care is taken to avoid injury to the motor branch of the median nerve. The tumor and its capsule are excised. The tourniquet is released and meticulous hemostasis is achieved using a bipolar electrocautery. The wound is inspected and irrigated. The wound closed.

Description of Post-Service Work: Apply soft protective dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular

status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Recon medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for several more visits through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 26116 (Excision, tumor or vascular malformation, soft tissue of hand or finger; deep (subfascial or intramuscular)) will be deleted in 2010 and replaced by two new codes (P51 and P52). During the Harvard study, 14 orthopaedic surgeons were surveyed. Hand surgery and plastic surgery were not included in the review. No positioning time was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 6.61 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.049. This RVW is the same as the reference code 25109. Total work for both codes is very similar.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the thenar eminence. The subcutaneous tissue is dissected. The thenar fascia is opened. The flexor pollicis brevis muscle fibers are split to expose the tumor. Care is taken to avoid injury to the motor branch of the median nerve. The tumor and its capsule are excised. The tourniquet is released and meticulous hemostasis is achieved using a bipolar electrocautery. The wound is inspected and irrigated. The wound is closed.

Description of Post-Service Work: Apply soft protective dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular

status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for several more visits through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2009		
Presenter(s):	John Heiner, MD; William Creevy, MD; Daniel Nagle, MD, FACS; Martha Matthews, MD, FACS		
Specialty(s):	orthopaedic surgery; orthopaedic surgical oncology; hand surgery; plastic surgery

Median Total Time	**214.00**	**191.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	2.75	2.38
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.63	2.25
Urgency of medical decision making	2.38	2.50

Technical Skill/Physical Effort (Mean)

Technical skill required	2.88	2.88
Physical effort required	2.63	2.63

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.88	2.75
Outcome depends on the skill and judgment of physician	2.88	2.88
Estimated risk of malpractice suit with poor outcome	2.88	2.75

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	2.88	2.88
Intra-Service intensity/complexity	3.00	3.00
Post-Service intensity/complexity	2.63	2.75

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 26616 (Excision, tumor or vascular malformation, soft tissue of hand or finger; deep (subfascial or intramuscular)) will be deleted in 2010 and replaced by two new codes (P51 and P52). During the Harvard study, 14 orthopaedic surgeons were surveyed. Hand surgery and plastic surgery were not included in the review. No positioning time was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 7.77 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.058. This is the same as the IWPUT for the reference code 25109. The difference in RVW reflects the additional intra-operative time required.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 26116

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Excel File for all soft tissue tumor codes will be provided.

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27048 Tracking Number P60 Specialty Society Recommended RVU: **8.74**

Global Period: 090 RUC Recommended RVU: **8.74**

CPT Descriptor: Excision, tumor, soft tissue of pelvis and hip area, subfascial (eg, intramuscular); less than 5 cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female undergoes excision of a 4 cm lipoma deep in the gluteus maximus.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 46% , Kept overnight (less than 24 hours) 51% , Admitted (more than 24 hours) 3%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 78%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Local anesthesia is infiltrated into the marked incision site as preemptive analgesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue over the lesion. Subcutaneous flaps are raised with electrocautery. The gluteus maximus muscle is exposed around the tumor. The tumor is excised along with surrounding muscle using electrocautery and dissection. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. Hemostasis is secured with electrocautery and sutures where needed. The wound is inspected and irrigated. Devitalized muscle is debrided. Where possible, the muscle fascial defect is approximated. A Penrose drain is placed in the cavitary defect. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and

discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relev data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval c charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a week and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27048 (Excision, tumor, pelvis and hip area; deep, subfascial, intramuscular) will be deleted in 2010 and replaced by two new codes (P60 and P61). During the Harvard study, 8 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for lateral positioning.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW *adjusted* down to 8.74 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.039. This is less than the IWPUT for the reference code 15100, which has less intra-operative time, more post work, and similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27048

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Excel File for all soft tissue tumor codes will be provided.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27045 Tracking Number P61 Specialty Society Recommended RVU: **12.63**

Global Period: 090 RUC Recommended RVU: **11.00**

CPT Descriptor: Excision, tumor, soft tissue of pelvis and hip area, subfascial (eg, intramuscular); 5 cm or greater

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female undergoes excision of an 8 cm lipoma deep in the gluteus maximus.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 6% , Kept overnight (less than 24 hours) 57% , Admitted (more than 24 hours) 37%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 80%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: In incision is made from the greater trochanter up toward the posterior superior iliac spine. The subcutaneous tissue is split and the fascia of the iliac tibial band and the gluteus maximus is identified and split. The gluteus maximus muscle is very carefully split proximally and several perforating vessels off the inferior gluteal artery are ligated and tied. Once that is done, self retaining retractors are put into the gluteus maximus muscle and a portion of the mass is seen. The greater trochanter is exposed in the distal portion of the wound and the lipoma is released very carefully over the greater trochanter. Dissection of the lipoma off the posterior aspect of the gluteus medius is then performed. Distally in the wound the sciatic nerve is identified underneath the lipoma. Very carefu' dissection is performed to remove the lipoma from on top of the sciatic nerve. The inferior gluteal nerve, artery a vein are perforating the gluteus maximus in the distal portion of the wound. They are also identified, dissected out an protected. Several branches off the inferior gluteal vessels are ligated and incised. The remainder of the lipoma is released off the deep surface of the gluteus maximus up toward the sciatic notch. Anteriorly, the remainder of the lipoma is removed off the back of the gluteus medius. Now the lipoma is attached only near the sciatic notch. The superior gluteal artery and vein are coming around the superior corner of the sciatic notch. Several vessels perforating

the lipoma coming off the superior gluteal vessels are ligated and tied. Once that is done, dissection can be done to release the lipoma off the gluteal vessels. The remainder of the lipoma near the sciatic notch is very slowly released. The inferior gluteal vessels can be seen by the sciatic notch and are carefully protected. The sciatic nerve is been carefully protected along with the piriformis tendon coming through the notch. The mass is then removed in one piece. The wound is copiously irrigated and the area is inspected to be certain there no residual tumor. The specimen is handed off the field. A deep drain is placed and brought out the gluteus maximus. The wound is closed layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a week and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Median Total Time	**320.00**	**345.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.86	3.43
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.43	3.00
Urgency of medical decision making	3.14	2.86

Technical Skill/Physical Effort (Mean)

Technical skill required	4.29	3.71
Physical effort required	3.57	3.57

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.43	3.29
Outcome depends on the skill and judgment of physician	4.14	3.86
Estimated risk of malpractice suit with poor outcome	3.43	3.29

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.57	3.29
Intra-Service intensity/complexity	4.00	3.86
Post-Service intensity/complexity	2.86	2.71

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27048 (Excision, tumor, pelvis and hip area; deep, subfascial, intramuscular) will be deleted in 2010 and replaced by two new codes (P60 and P61). During the Harvard study, 8 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for lateral positioning.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW *adjusted* down to 12.63 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.068. This is similar to the IWPUT for the reference code 47100, which has less intra-operative time and similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27048

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 39-year-old male undergoes excision of a 3.5 cm tumor posterior to the knee joint that is pigmented villonodular synovitis.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 40% , Kept overnight (less than 24 hours) 45% , Admitted (more than 24 hours) 14%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Place tourniquet on the proximal thigh. Prep and drape leg. Elevate and exsanguinate leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 6cm incision is made over the tumor on the posterior knee. The subcutaneous tissue is opened and the fascia over the popliteal space is split. The tumor is identified between the semimembranosus and the medial head of the gastrocnemius muscles. The neurovascular bundle is retracted laterally. Dissection is carried around the mass and the mass is released off of the muscles. The tumor is released from the posterior knee capsule. The tumor is handed off of the field. The wound is inspected and irrigated. The posterior capsule is repaired. A deep drain is placed. The fascia is carefully closed. The superficial wound is closed in layers with interrupted sutures.

Description of Post-Service Work: A compressive dressing is applied in the operating room, the tourniquet is let down and compression is held for 10 minutes on the leg to prevent hematoma formation. A knee immobilizer is applied. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor

patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focu exam, assessing the open wound status drain. Assess neurovascular status. Wound care and close observation . important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 9 **% of respondents:** 21.4 %

TIME ESTIMATES (Median)	**CPT Code: 27328**	**Key Reference CPT Code: 15100**	**Source of Time RUC Time**
Median Pre-Service Time	68.00	65.00	
Median Intra-Service Time	60.00	60.00	
Median Immediate Post-service Time	20.00	20.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	20.0	20.00	
Median Discharge Day Management Time	38.0	38.00	
Median Office Visit Time	55.0	78.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**261.00**	**281.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.11	2.78
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.22	2.78
Urgency of medical decision making	3.33	2.78

Technical Skill/Physical Effort (Mean)

Technical skill required	3.56	3.33
Physical effort required	3.22	3.11

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.33	3.11
Outcome depends on the skill and judgment of physician	3.44	3.22
Estimated risk of malpractice suit with poor outcome	3.56	3.11

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	2.89	2.67
Intra-Service intensity/complexity	2.89	2.78
Post-Service intensity/complexity	2.89	2.67

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27328 (Excision, tumor, thigh or knee area; deep, subfascial, or intramuscular) will be deleted in 2010 and replaced by two new codes (P70 and P71). During the Harvard study, 9 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. No positioning time was recorded. Facility work was underestimated.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 8.74 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.052. This is similar to the IWPUT for the reference code 15100, which has the same intra-operative time and similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27328

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

SUMMARY OF RECOMMENDATION

CPT Code:27339 Tracking Number P71 Specialty Society Recommended RVU: **12.27**

Global Period: 090 RUC Recommended RVU: **11.00**

CPT Descriptor: Excision, tumor, soft tissue of thigh or knee area, subfascial (eg, intramuscular); 5 cm or greater

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 39-year-old male undergoes excision of a 10 cm tumor posterior to the knee joint that is pigmented villonodular synovitis.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 7% , Kept overnight (less than 24 hours) 40% , Admitted (more than 24 hours) 52%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 88%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Place tourniquet on the proximal thigh. Prep and drape leg. Elevate and exsanguinate leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A 13 cm incision curving across the posterior knee crease is performed. The subcutaneous flaps are raised and the fascia is split. The cutaneous branches of the sural nerve in the midline of the calf are carefully protected. A large brownish mass is identified and dissected off the surrounding tissues. Since it is coming off the posterior knee joint, dissection is gradually carried down toward the knee. The semi-membranous tendon is retracted medially and the mass indeed comes out lateral rather than medial to the medial head of the gastrocnemius muscle. The medial head of the gastrocnemius muscle is retracted and then since the mass is lateral, care is taken to protect the innervation to the medial head of the gastrocnemius muscle as well as to the tibia nerve, popliteal artery a popliteal vein. The mass is mobilized off the lateral head of the gastrocnemius muscle. It is also mobilized distally on the proximal end of the soleus. A small portion of proximal soleus is released to allow the tibia nerve and the popliteal vessels to be retracted. The popliteal vessels are retracted laterally along with the tibial nerve, exposing the posterior knee joint. The mass is taken down directly until it enters the posterior knee joint under the medial head of the gastrocnemius. The mass is removed. A deep drain is placed. The medial and lateral heads of the gastroc muscle

along with the neurovascular bundle are allowed to fall back into place. Several small branches of the popliteal artery had to be ligated to expose this portion of the joint. The remainder of the fascia is left open to prevent compartment syndrome in the superficial posterior compartment. Absorbable sutures are used on the subcutaneous and interrupted nylons are used on the skin.

Description of Post-Service Work: A compressive dressing is applied in the operating room, the tourniquet is let down and compression is held for 10 minutes on the leg to prevent hematoma formation. A knee immobilizer is applied. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing the open wound status drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27328 (Excision, tumor, thigh or knee area; deep, subfascial, or intramuscular) will be deleted in 2010 and replaced by two new codes (P70 and P71). During the Harvard study, 9 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. No positioning time was recorded. Facility work was underestimated.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW *adjusted* down to 12.27 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.066. This is greater than the IWPUT for the reference code 27880 and reflects the more complex work. The RVW is less than the reference code accounting for less post-op work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Place tourniquet on the proximal thigh. Prep and drape leg. Elevate and exsanguinate leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 7 cm skin incision is made just anterior to the fibula. The subcutaneous tissue is split and the fascia is split. The muscles of the anterior compartment of the leg are identified and are retracted anteriorly off of the interosseus membrane. Any perforating vessels are ligated and tied. The tumor is carefully dissected off the interosseus membrane protecting the deep structures of the leg. The tumor is sent to pathology. The wound is irrigated and inspected. The fascia is left open to prevent compartment syndrome. A drain is placed. The tourniquet is deflated and any bleeders are cauterized.

Description of Post-Service Work: Apply sterile dressings and splint. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks

and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and appropriate use of crutches or walker. Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and at several more visits through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures and drain; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Time Segments (Mean)

Pre-Service intensity/complexity	3.14	2.86
Intra-Service intensity/complexity	3.00	3.00
Post-Service intensity/complexity	2.86	2.57

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27619 (Excision, tumor, leg or ankle area; deep (subfascial or intramuscular)) will be deleted in 2010 and replaced by two new codes (P79 and P80). During the Harvard study, 9 orthopaedic surgeons were surveyed. General surgery and podiatry were not involved. Pre and post times were predicted. No positioning time was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 20 minutes for prone positioning and application of a tourniquet
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 6.80 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.042. This is less than the IWPUT for the reference code 15100. The difference in RVW reflects the additional post-operative work required.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27619

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old female undergoes excision of a 7.5 cm lipoma on the interosseous membrane deep to the anterior and lateral compartments of the leg.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 35% , Kept overnight (less than 24 hours) 49% , Admitted (more than 24 hours) 16%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 83%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of antibiotic. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Place tourniquet on the proximal thigh. Prep and drape leg. Elevate and exsanguinate leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 10 cm skin incision is made just anterior to the fibula. The subcutaneous tissue is split and the fascia is split. The muscles of the anterior compartment of the leg are identified and are retracted anteriorly off of the interosseus membrane. The tumor is carefully dissected off the interosseus membrane protecting the deep structures of the leg. Any perforating vessels are ligated and tied. The tumor is sent to pathology. The wound is irrigated and inspected. The fascia is left open to prevent compartment syndrome. A drain is placed. The tourniquet is deflated and any bleeders are cauterized.

Description of Post-Service Work: Apply sterile dressings and splint. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss

ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27619 (Excision, tumor, leg or ankle area; deep (subfascial or intramuscular)) will be deleted in 2010 and replaced by two new codes (P79 and P80). During the Harvard study, 9 orthopaedic surgeons were surveyed. General surgery and podiatry were not involved. Pre and post times were predicted. No positioning time was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: Add 10 minutes for additional review of imaging, pathology and consultation with other health professionals for reconstruction.
- Positioning: Add 20 minutes for prone positioning and application of a tourniquet
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW *adjusted* down to 10.20 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.055. This is similar to the IWPUT for the reference code 28299. The difference in RVW accounts for less intra-op time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Verify that all required instruments and supplies are available. Assist with patient supine positioning and padding to stabilize foot. Perform regional block. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made on the plantar aspect of the right arch. Dissection is carried out to reveal a 1.2 cm in diameter purplish lesion. The tumor is dissected from surrounding tissue, and all bleeders are cauterized. The lesion is delivered from the wound. The wound site is irrigated and inspected. The wound is closed in layers with simple interrupted sutures and the skin is coapted with a running mattress of nylon. The tourniquet is deflated, and normal capillary return is seen in the toes.

Description of Post-Service Work: Apply compression dressing and splint/shoe. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile

medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a few days and for several more visits through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss patholo report when available. Order and review periodic lab and/or imaging, as necessary. Reconcile medication(s). Ass functional recovery and determine whether there is a need for physical therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

SURVEY DATA

Post-Service intensity/complexity	2.43	2.29

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 28045 (Excision, tumor, foot; deep, subfascial, intramuscular) will be deleted in 2010 and replaced by two new codes (P88 and P89). During the Harvard study, 10 orthopaedic surgeons were surveyed. Podiatry, the primary and significant provider of this service, was not involved. Pre and post times were predicted. No positioning work was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: No change. The 5 minutes allocated for moderate sedation by an anesthesiologist is replaced by 5 minutes for the surgeon to perform a regional block.
- Positioning: Add 5 minutes. Patient's leg is elevated and foot is stabilized. Opposite extremity is padded. Tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 5.34 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.041. This is similar to the IWPUT for the reference code 13121. The RVW is greater than the reference code, accounting for more post work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28045

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Excel File for all soft tissue tumor codes will be provided.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

CPT Descriptor: Excision, tumor, soft tissue of foot or toe, subfascial (eg, intramuscular); 1.5 cm or greater

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male undergoes excision of a 5 cm hemangioma in the deep plantar space of the foot.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Percent of survey respondents who stated they perform the procedure; In the hospital 96% , In the ASC 0%, In the office 4%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 65% , Kept overnight (less than 24 hours) 28% , Admitted (more than 24 hours) 7%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 77%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient supine positioning and padding to stabilize foot. Perform regional block. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A curvilinear incision is made on the sole of the foot. The subcutaneous tissue is incised and the plantar fascia is split. The lateral plantar nerve and artery are identified in the wound as they come through the medial side of the foot. The aponeurosis of the plantar fascia is also identified and is split along the medial side to allow access to the sole of the foot. The flexor digitorum brevis muscle is retracted laterally and a portion of it is released off the anterior calcaneus. This allows clear exposure of the lateral plantar nerve and artery and the medial plantar nerve and artery. The mass is just between the two nerves and is noted to be wrapping around the interval at the medial side of the quadratus plantae muscle. The flexor digitorum longus tendon is mobilized off the quadratus plantae and retracted medially. The quadratus plantae muscle is retracted laterally and the mass is exposed. Careful resection performed to remove the mass from the space in one piece. The flexor hallucis tendon is mobilized medially. The tumor is dissected off the abductor hallucis muscle. Once it is removed, the flexor digitorum is allowed to fall back into position as well as the quadratus plantae muscle. Both the medial plantar artery and nerve and the lateral plantar artery and nerve are inspected. The flexor digitorum brevis muscle is allowed to fall back into position and several absorbable sutures are put into the base where it was released partially off the calcaneus. The plantar aponeurosis is left to fall back

into place. Any branches of the medial plantar artery that perforated the septum are ligated. The fascia is closed with interrupted suture. The subcutaneous wound is closed with absorbable suture. Nylon is used in the curvilinear incision on the sole of the foot.

Description of Post-Service Work: A compressive foot dressing is applied in the operating room, the tourniquet is let down and compression is held for 10 minutes on the foot to prevent hematoma formation. Apply splint. Transfer patient to the recovery room. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a few days and for several more visits through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Reconcile medication(s). Assess functional recovery and determine whether there is a need for physical therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 28045 (Excision, tumor, foot; deep, subfascial, intramuscular) will be deleted in 2010 and replaced by two new codes (P88 and P89). During the Harvard study, 10 orthopaedic surgeons were surveyed. Podiatry, the primary and significant provider of this service, was not involved. Pre and post times were predicted. No positioning work was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 5 minutes. Patient's leg is elevated and foot is stabilized. Opposite extremity is padded. Tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 8.26 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.064. This is similar to the IWPUT for the reference code 29891. The RVW is less than the reference code, accounting for less post work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28045

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:21015 Tracking Number P5 Specialty Society Recommended RVU: **9.71**

Global Period: 090 RUC Recommended RVU: **9.71**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of face or scalp; less than 2 cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male presents with a 1.5 cm sarcoma of the jaw muscles. At operation, the tumor and adjacent soft tissue are resected.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 51% , Kept overnight (less than 24 hours) 23% , Admitted (more than 24 hours) 26%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 60%

; moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of antibiotic bolus and anticoagulation meds. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and stabilize the head. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Infiltrate a local anesthetic to reduce postoperative pain. A facial nerve monitor is positioned

Description of Intra-Service Work: A curvilinear incision is made in relaxed skin tension creases anterior to the auricle, extending inferiorly and then anteriorly into the upper neck, three centimeters below and parallel to the lower edge of the mandible. A subplatysmal flap is elevated over the submandibular triangle, more superiorly at the level of the parotid fascia, to expose the submandibular and parotid glands. Peripheral branches of the facial nerve, including the buccal and marginal mandibular branches, are identified and preserved. The flap is further extended anteriorly over the asseter muscle to expose the tumor. The tumor is removed en bloc, including a wide margin of masseter muscle and ny necessary surrounding structures, including skin at the previous biopsy site. The specimen is sent to pathology for frozen and permanent sections. The specimen is oriented for the pathologist, with direct communication between the surgeon and pathologist to ensure accurate pathologic interpretation. Frozen sections are taken from the surrounding tissue as indicated. Additional excision is carried out if necessary to obtain a clear margin. The wound is inspected and

irrigated. A deep drain is placed taking care to avoid contact with facial nerve branches. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied, held in place with a head w bandage. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. W. brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient and assess facial nerve and jaw function. Monitor for hematoma formation and intraoral edema. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing), and special attention to chewing / using jaw muscle. Reconcile medications and write orders for home medications. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within 1-2 days and for several more visits through the 90-day global period to remove dressings, assess wound healing, and redress wound; and remove drain and sutures. Discuss pathology report when available with the patient and family, as well as, recommendations for further evaluation, treatment, and monitoring as appropriate. Communicate with other physicians providing adjuvant treatment if indicated. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for speech/swallowing therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Time Segments (Mean)

Pre-Service intensity/complexity	3.78	3.78
Intra-Service intensity/complexity	3.78	3.78
Post-Service intensity/complexity	3.22	3.33

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21015 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of face or scalp), will be deleted in 2010 and replaced by two new codes (P5 and P6). During the Harvard study, only 1 orthopaedic surgeon was surveyed. According to the PFS NPRM published in 1996, the RUC identified 21015 as potentially overvalued during the first 5-year-review. The RUC database indicates that AAOHNS presented comparable codes to show th 21015 was not overvalued. The time shown in the database in not validated survey time. Because the primary providers of this service were not involved in the Harvard review that predicted all time components, we believe the current RVW for this code is not based on relativity. The current RVW and the database time and visit information result in an IWPUT of 0.020, exceptionally low for a deep malignant tumor in the face/scalp.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 5 minutes After induction of anesthesia in supine position, assist with adjusting the OR table and anesthesia lines so that the operative site is assessable and stabilizing the head.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 9.71 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.053. This RVW and IWPUT is less than the reference code 38700, accounting for less intra-operative work and facility work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of antibiotic bolus and anticoagulation meds. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and stabilize the head. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Infiltrate a local anesthetic to reduce postoperative pain. A facial nerve monitor is positioned.

Description of Intra-Service Work: A curvilinear incision is made in relaxed skin tension creases anterior to the auricle, extending inferiorly and then anteriorly into the upper neck, three centimeters below and parallel to the lower edge of the mandible. A subplatysmal flap is elevated over the submandibular triangle, more superiorly at the level of the parotid fascia, to expose the submandibular and parotid glands. Peripheral branches of the facial nerve, including the buccal and marginal mandibular branches, are identified and preserved. The flap is further extended anteriorly over t masseter muscle to expose the tumor. The parotid gland and peripheral branches of the facial nerve are retracted an the tumor is removed en bloc, including a wide margin of jaw musculature and any necessary surrounding structures, including skin at the previous biopsy site. The specimen is sent to pathology for frozen and permanent sections. The specimen is oriented for the pathologist, with direct communication between the surgeon and pathologist to ensure accurate pathologic interpretation. Frozen sections are taken from the surrounding tissue as indicated. Additional

excision is carried out if necessary to obtain a clear margin. The wound is inspected and irrigated. A deep drain is placed taking care to avoid contact with facial nerve branches. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied, held in place with a head wrap bandage. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, with attention to possible airway issues. After patient is awake, discuss surgery outcome with patient and assess facial nerve and jaw function. Monitor for hematoma formation and intraoral edema. Write orders for transferring to ICU and discuss ongoing care with nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Examine patient, assessing airway, hemodynamic status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, eating, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write orders for home medications. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available with the patient and family, as well as, recommendations for further evaluation, treatment, and monitoring as appropriate. Communicate with other physicians providing adjuvant treatment if indicated Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for speech/swallowing therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 9 **% of respondents:** 20.9 %

TIME ESTIMATES (Median)	CPT Code: 21016	Key Reference CPT Code: 41130	Source of Time RUC Time
Median Pre-Service Time	68.00	80.00	
Median Intra-Service Time	100.00	90.00	
Median Immediate Post-service Time	30.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	60.0	60.00	
Median Discharge Day Management Time	38.0	38.00	
Median Office Visit Time	102.0	109.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**398.00**	**407.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.13	3.75
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.00	3.63
Urgency of medical decision making	4.00	3.38

Technical Skill/Physical Effort (Mean)

Technical skill required	4.25	4.00
Physical effort required	4.00	3.75

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.13	3.63
Outcome depends on the skill and judgment of physician	4.25	3.75
Estimated risk of malpractice suit with poor outcome	3.88	3.38

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.88	3.50
Intra-Service intensity/complexity	4.13	3.75
Post-Service intensity/complexity	3.50	3.13

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21015 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of face or scalp), will be deleted in 2010 and replaced by two new codes (P5 and P6). During the Harvard study, only 1 orthopaedic surgeon was surveyed. According to the PFS NPRM published in 1996, the RUC identified 21015 as potentially overvalued during the first 5-year-review. The RUC database indicates that AAOHNS presented comparable codes to show that 21015 was not overvalued. The time shown in the database in not validated survey time. Because the primary providers of this service were not involved in the Harvard review that predicted all time components, we believe the current RVW for this code is not based on relativity. The current RVW and the database time and visit information result in an IWPUT of 0.020, exceptionally low for a deep malignant tumor in the face/scalp.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 5 minutes After induction of anesthesia in supine position, assist with adjusting the OR table and anesthesia lines so that the operative site is assessable and stabilizing the head.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 15.05 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.060. This RVW and IWPUT is less than the reference code 41130, a very comparable procedure in terms of time, intensity, complexity, and total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21015

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of anticoagulation meds. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient positioning with shoulder roll, head rotated and stabilized. Assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, an incision is made along the sternocleidomastoid muscle encompassing the overlying skin from the biopsy site. Subplatysmal flaps are raised. The tumor, attached to the sternocleidomastoid muscle, is isolated. Medially and superiorly, the internal jugular vein, carotid artery and vagus nerve are identified and retracted toward the midline. Laterally and posteriorly, the spinal accessory nerve is identified ithin the posterior triangle, and dissected free of the sternocleidomastoid muscle anteriorly to the internal jugular vein, ,reserving the nerve. Transection of the superior aspect of the sternocleidomastoid muscle, already partially transected by following the spinal accessory nerve, is completed with a wide margin around the tumor. Inferior to the tumor, the sternocleidomastoid muscle is likewise transected with a wide margin, separating the muscle from the internal jugular vein and omohyoid muscle. The deep aspect of the tumor and sternocleidomastoid muscle are then dissected free of the fascia investing the deep neck musculature and brachial plexus, taking care not to traumatize these structures, taking a

margin of fibrofatty tissue The specimen is sent to pathology for frozen and permanent sections. The specimen is oriented for the pathologist, with direct communication between the surgeon and pathologist to ensure accurate pathologic interpretation. Frozen sections are taken from the surrounding tissue as indicated. Additional excision is carried out if necessary to obtain a clear margin. The wound is inspected and irrigated. A deep drain is placed. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied to the neck. Discuss postoperative care with recovery room staff. Assess hemodynamic, cranial nerve and drain function. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including determination of hematocrit, oxygenation status, and airway patency. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Discuss surgery outcome with patient. Perform an expanded problem focused exam, reassessing hemodynamic and airway status, cranial nerve, and drain function. Wound care and close observation are important to avoid or promptly treat wound hematoma. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write orders for home medications. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drains when appropriate. Discuss pathology report with the patient and family, as well as, recommendations for further evaluation, treatment, and monitoring as appropriate. Communicate with other physicians providing adjuvant treatment if indicated. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21557 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of neck or thorax), soft tissue of foot) will be deleted in 2010 and replaced by two new codes (P11 and P12). During the Harvard study, 11 general surgeons were surveyed. Otolaryngology was not involved. No positioning work was recorded. No positioning time was recorded. These patients are not typically Medicare-aged and will typically be admitted to the hospital. The Medicare database site of service distribution for this code does not reflect national distribution.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: No change
- Positioning: Add 9 minutes - After induction of anesthesia in supine position, assist with patient positioning with shoulder roll, head rotated and stabilized. Assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and head, adjust as needed..
- Scrub/Dress/Wait: No change

Recommendation: The survey data show - and our expert consensus panel concurs - that patients with deep sarcomas will typically be admitted to the hospital. The consensus committee recommends the survey median RVW *adjusted* down to 14.57 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.056. This RVW is greater than the reference code 38700, accounting fo more intra-operative time and complexity and more post-op work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of anticoagulation meds. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient positioning with shoulder roll, head rotated and stabilized. Assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, an incision is made along the sternocleidomastoid muscle encompassing the overlying skin from the biopsy site. Subplatysmal flaps are raised. The tumor, attached to the sternocleidomastoid muscle, is isolated. Medially and superiorly, the internal jugular vein, carotid artery and vagus nerve are identified and retracted toward the midline. Laterally and posteriorly, the spinal accessory nerve is identified within the posterior triangle, and dissected free of the sternocleidomastoid muscle anteriorly to the internal jugular ve preserving the nerve. Transection of the superior aspect of the sternocleidomastoid muscle, already partially transected by following the spinal accessory nerve, is completed with a wide margin around the tumor. Inferior to the tumor, the sternocleidomastoid muscle is likewise transected with a wide margin, separating the muscle from the internal jugular vein and omohyoid muscle. The deep aspect of the tumor and sternocleidomastoid muscle are then dissected free of the fascia investing the deep neck musculature and brachial plexus, taking care not to traumatize these structures, taking a

margin of fibrofatty tissue The specimen is sent to pathology for frozen and permanent sections. The specimen is oriented for the pathologist, with direct communication between the surgeon and pathologist to ensure accurate pathologic interpretation. Frozen sections are taken from the surrounding tissue as indicated. Additional excision is carried out if necessary to obtain a clear margin. Often, removal of the internal jugular vein, spinal accessory nerve, or other neurovascular structures is required to obtain clear margins. The wound is inspected and irrigated. A deep drain is placed. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied to the neck. Discuss postoperative care with recovery room staff. Assess hemodynamic, cranial nerve and drain function. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including determination of hematocrit, oxygenation status, and airway patency. Write orders for transferring to ICU and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Discuss surgery outcome with patient. Perform an expanded problem focused exam, reassessing hemodynamic and airway status, cranial nerve, and drain function. Wound care and close observation are important to avoid or promptly treat wound hematoma. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write orders for home medications. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drains when appropriate. Discuss pathology report with the patient and family, as well as, recommendations for further evaluation, treatment, and monitoring as appropriate. Communicate with other physicians providing adjuvant treatment if indicated. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and letermine whether there is a need for physical therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2009				
Presenter(s):	Christopher Senkowski, MD FACS; Jane Dillon, MD FACS				
Specialty(s):	general surgery; otolaryngology				
CPT Code:	21558

Time Segments (Mean)		
Pre-Service intensity/complexity	4.50	4.30
Intra-Service intensity/complexity	4.30	4.00
Post-Service intensity/complexity	4.10	4.10

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21557 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of neck or thorax), soft tissue of foot) will be deleted in 2010 and replaced by two new codes (P11 and P12). During the Harvard study, 11 general surgeons were surveyed. Otolaryngology was not involved. No positioning work was recorded. No positioning time was recorded. These patients are not typically Medicare-aged and will typically be admitted to the hospital. The Medicare database site of service distribution for this code does not reflect national distribution.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change.
- Positioning: Add 9 minutes - After induction of anesthesia in supine position, assist with patient positioning with shoulder roll, head rotated and stabilized. Assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and head, adjust as needed.
- Scrub/Dress/Wait: no change

Recommendation: The survey data show - and our expert consensus panel concurs - that patients with deep sarcomas will typically be admitted to the hospital. The consensus committee recommends the survey median RVW *adjusted* down to 21.37 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit nformation, this results in an IWPUT of 0.068. This RVW is greater than the reference code 15734, accounting for greater intra-operative complexity and intensity and additional facility work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21557

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Global Period: 090 RUC Recommended RVU: **15.54**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of back or flank; less than 5 cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female presents with a 4 cm sarcoma in the trapezius on the back. At operation, the tumor and adjacent soft tissue are resected.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 5% , Kept overnight (less than 24 hours) 22% , Admitted (more than 24 hours) 73%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

's moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies with special attention to review of x-ray, CT, MRI, MRA. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, an incision is made over the trapezius. Medial and lateral subcutaneous flaps are raised. The overlying skin from the biopsy is excised with the tumor. The musculature is exposed around the tumor. The fascia is incised and part of it is included with the specimen in the dissection for proper margins. The dissection removes a large portion of the trapezius including the fascia of the deep paraspinal muscles below it. The tumor is removed en bloc, including necessary surrounding structures. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. Frozen sections are taken from the surrounding tissue. The deep fascia is inspected for involvement by the tumor as are the ribs and intercostal muscles. If deep margins involved then resection to the periosteum of the ribs is carried out. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the

surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. Metallic clips are placed to mark the margins for possible postoperative radiotherapy guidance. T wound is inspected and irrigated. Devitalized muscle is debrided. A deep drain is placed. The wound is closed layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings and soft brace. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a week and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Order medications as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21935 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of back or flank) will be deleted in 2010 and replaced by two new codes (P17 and P18). During the Harvard study, 12 general surgeons were surveyed only for intra-operative time. Pre and post times were predicted. The Harvard study intra-time is less than the RUC survey intra-time for both P17 and P18. These patients are not typically Medicare-aged and will typically be admitted to the hospital for resection of these deep malignant tumors.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 15.54 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.057. This is similar to the IWPUT for the reference code 27880, which has less intra-operative time and similar total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21935

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:21936 Tracking Number P18 Specialty Society Recommended RVU: **22.34**

Global Period: 090 RUC Recommended RVU: **22.34**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of back or flank; 5 cm or greater

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female presents with a 10 cm sarcoma in the trapezius and paraspinal muscles. At operation, the tumor and adjacent soft tissue are resected.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 2% , Admitted (more than 24 hours) 98%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, an incision is made over the trapezius. Medial and lateral subcutaneous flaps are raised. The overlying skin from the biopsy is excised with the tumor. The musculature is exposed around the tumor. The fascia is incised and part of it is included with the specimen in the dissection for proper margins. The dissection removes a large portion of the trapezius including the fascia of the deep paraspinal muscles below it. The tumor is removed en bloc, including necessary surrounding structures. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. Frozen sections are taken from the surrounding tissue. The deep fascia is inspected for involvement by the tumor as are the ribs and intercostal muscles. If deep margins involved then resection to the periosteum of the ribs is carried out. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of

the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. Metallic clips are placed to mark the margins for possible postoperative radiotherapy guidance. The wound is inspected and irrigated. Devitalized muscle is debrided. A deep drain is placed. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings and soft brace. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a week and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Order medications as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Time Segments (Mean)

Pre-Service intensity/complexity	4.60	4.00
Intra-Service intensity/complexity	4.60	4.10
Post-Service intensity/complexity	3.90	3.60

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21935 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of back or flank) will be deleted in 2010 and replaced by two new codes (P17 and P18). During the Harvard study, 12 general surgeons were surveyed only for intra-operative time. Pre and post times were predicted. The Harvard study intra-time is less than the RUC survey intra-time for both P17 and P18. These patients are not typically Medicare-aged and will typically be admitted to the hospital for resection of these deep malignant tumors.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically be admitted to the hospital. The consensus committee recommends the survey median RVW *adjusted* down to 22.34 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.073. This is less than the IWPUT for the reference code 49203, which has less intra-operative time and less total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 7 incision is made over the posterior deltoid tumor, excising the old biopsy tract. Medial and lateral subcutaneous flaps are raised. The innervation of the deltoid is protected. Careful dissection is carried into the deltoid muscle staying in normal muscle. A radical excision of the posterior deltoid is made. The tumor is removed en bloc, including necessary surrounding structures preserving the axillary nerve. Frozen sections are taken from the surrounding tissue. The margins and tumor are sent to pathology. The pathology report is received and additional excision is carried out as necessary to obtain a clear margin. The wound is inspected and rigated. Hemostasis is obtained. A deep drain is placed. The deep tissue is closed. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply dressings and shoulder immobilizer. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss

ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of shoulder immobilizer. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Pre-Service intensity/complexity	4.17	3.75
Intra-Service intensity/complexity	4.25	3.83
Post-Service intensity/complexity	3.92	3.50

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 23077 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of shoulder area) will be deleted in 2010 and replaced by two new codes (P29 and P30). During the Harvard study, 11 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. The current survey, which includes general surgeons results in different time and visit data.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 17.48 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.062. This is similar to the IWPUT for the reference code 23395, which represents similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23077

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:23078 Tracking Number P30 Specialty Society Recommended RVU: **22.34**

Global Period: 090 RUC Recommended RVU: **22.34**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of shoulder area; 5 cm or greater

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male presents with a 10 cm malignant fibrous histiocytoma in the right posterior deltoid muscle. At operation, a radical resection of the shoulder with adjacent soft tissue is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 6% , Admitted (more than 24 hours) 94%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 14 incision is made over the posterior deltoid tumor, excising the old biopsy tract. Medial and lateral subcutaneous flaps are raised. The innervation of the deltoid is protected. The parascapular muscles are identified and protected. Careful dissection is carried into the deltoid muscle staying in normal muscle. A radical excision of the posterior deltoid is made. Subperiosteal dissection of the tumor off of the scapula is carried out. The tumor is removed en bloc, including necessary surrounding structures preserving the axillary nerve. Frozen sections are taken from the surrounding tissue. The margins and tumor are sent to pathology. The pathology report is received and additional excision is carried out as necessary to obtain a clear margin. The wound is inspect and irrigated. Hemostasis is obtained. A deep drain is placed. The deep tissue is closed with interrupted sutures. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply dressings and shoulder immobilizer. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After

patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient nd patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess eurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent day(s), review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of shoulder immobilizer. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 23077 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of shoulder area) will be deleted in 2010 and replaced by two new codes (P29 and P30). During the Harvard study, 11 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. The current survey, which includes general surgeons results in different time and visit data.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 22.34 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.072. This is similar to the IWPUT for the reference code 23472, which represents similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Exsanguinate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A volar longitudinal incision is made beginning at the elbow crease including an elliptical incision around the previous biopsy track to keep this en bloc with the specimen. Dissection is then carried through the skin and subcutaneous tissues angling away from the biopsy track to avoid entering tissues contaminated by the initial biopsy. The deep fascia is incised longitudinally and again includes an ellipse around the biopsy track. Dissection proceeds in medial and lateral directions to form appropriate flaps and facilitate deep dissection. Perforating vessels are encountered and are ligated and incised. Proximally, the radial and ulnar arteries as well as the median and ulnar nerves are identified and dissection is carried adjacent to these structures to establish a plane of dissection which preserves them but remains in normal tissues outside of tumor. Several perforating vessels leading to the tumor are ligated and incised. In the proximal portion of the surgical field, the involved flexor muscles are exposed above the proximal extent of the tumor. These structures are then incised to establish a proximal margin well beyond tumor

extension. At this point the neuro-vascular structures are again identified. They are carefully dissected and separated from the adjacent tumor and intended plane of dissection. Several motor branches are seen to run into the tumor and can not be preserved so these branches are individually ligated and incised. Other motor branches are noted to bypass the tissues involved in the tumor and these are protected and preserved. Dissection is then carried along the medial lateral aspects of the tumor keeping normal tissue between the tumor and the plane of dissection. Several perforat vessels are again encountered and these are ligated and incised. Preoperative imaging studies are reviewed during the procedure to verify intended planes of dissection and proximity to neuro-vascular structures. Once the tumor has been dissected laterally, medial dissection is then begun and the tumor and surrounding tissues are gently lifted from the wound from proximal to distal. Further perforating vessels encountered and are ligated and incised. Further dissection is carried distally until the circumferential dissection is beyond the distal extent of the tumor. At this point, the involved flexor muscles are transected 2 cm from the furthest extent of tumor as determined by imaging studies and clinical impression. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. The tourniquet is let down. Hemostasis is obtained and drains are left deep in the wound. A multilayered closure is performed.

Description of Post-Service Work: Apply dressings and shoulder immobilizer. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Asse neurovascular status. Wound care and close observation are important to avoid or promptly treat compartm syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent day(s), review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of shoulder immobilizer. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 24077 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of upper arm or elbow area) will be deleted in 2010 and replaced by two new codes (P38 and P39). During the Harvard study, 12 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 15.54 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.058. This is similar to the IWPUT for the reference code 23395, which has a higher RVW to account for additional intra-op time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 24077

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 24077 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of upper arm or elbow area) will be deleted in 2010 and replaced by two new codes (P38 and P39). During the Harvard study, 12 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 20.40 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.070. This is less than the IWPUT for the reference code 24363, which has the same intra-time and similar total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:25077 Tracking Number P46 Specialty Society Recommended RVU: **12.75**

Global Period: 090 RUC Recommended RVU: **12.75**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of forearm and/or wrist area; less than 3 cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old male presents with a 3 cm malignant fibrous histiocytoma of the flexor carpi radialis. At operation, the tumor and adjacent soft tissue are resected.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 98% , In the ASC 0%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 28% , Kept overnight (less than 24 hours) 37% , Admitted (more than 24 hours) 35%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 76%

ıs moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review imaging, pathology and laboratory studies; with special attention to review of x-ray, CT, MRI, bone scan, PET scan and arteriograms, as well as consulting with radiology regarding margins. Communicate with plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on the upper arm. Prep and drape the arm. Scrub and gown. Perform surgical "time out" with operating surgical team. Elevate the arm and inflate the pneumatic tourniquet.

Description of Intra-Service Work: A volar longitudinal incision is made from the elbow crease to about 5 cm above the wrist including an elliptical incision around the previous biopsy track to keep this en bloc with the specimen. Dissection is then carried through the skin and subcutaneous tissues angling away from the biopsy track to avoid entering tissues ɔntaminated by the initial biopsy. The deep fascia is then incised longitudinally and again includes an ellipse around the ɔiopsy track. Dissection is then carried in medial and lateral directions to form appropriate flaps and facilitate deep dissection. Perforating vessels are encountered and are ligated and incised. Proximally, the radial and ulnar arteries as well as the median and ulnar nerves are identified and dissection is carried adjacent to these structures to establish a plane of dissection which preserves them but remains in normal tissues outside of tumor. Several perforating vessels leading to the tumor are ligated and incised. In the proximal portion of the surgical field, the involved flexor muscles

are exposed above the proximal extent of the tumor. These structures are then incised to establish a proximal margin well beyond tumor extension. At this point the neuro-vascular structures are again identified. They are carefully dissected and separated from the adjacent tumor and intended plane of dissection. Several motor branches are seen to run into the tumor and can not be preserved so these branches are individually ligated and incised. Other m branches are noted to bypass the tissues involved in the tumor and these are protected and preserved. Dissection is t carried along the medial and lateral aspects of the tumor keeping normal tissue between the tumor and the plane of dissection. Several perforating vessels are again encountered and these are ligated and incised. Preoperative imaging studies are reviewed during the procedure to verify intended planes of dissection and proximity to neuro-vascular structures. Once the tumor has been dissected laterally, medial dissection is then begun and the tumor and surrounding tissues are gently lifted from the wound from proximal to distal. Further perforating vessels encountered and are ligated and incised. Further dissection is carried distally until the circumferential dissection is beyond the distal extent of the tumor. At this point, the involved flexor muscles are transected 2 cm from the furthest extent of tumor as determined by imaging studies and clinical impression. Cultures are taken. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. The tourniquet is let down and hemostasis is obtained and drains are left deep in the wound. A multilayered closure is then performed.

Description of Post-Service Work: Apply soft dressing and splint to hold the wrist in neutral alignment. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentatio Later on the day of surgery, review medical records and interval data charted. Communicate with other professiona and with patient and patient's family. Perform an exam, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of sling. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 15 **% of respondents:** 25.8 %

TIME ESTIMATES (Median)	CPT Code: 25077	Key Reference CPT Code: 25515	Source of Time RUC Time
Median Pre-Service Time	72.00	45.00	
Median Intra-Service Time	100.00	90.00	
Median Immediate Post-service Time	30.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	20.0	0.00	
Median Discharge Day Management Time	38.0	0.00	
Median Office Visit Time	85.0	92.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**345.00**	**257.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.15	3.77
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.00	3.77
Urgency of medical decision making	3.85	3.31

Technical Skill/Physical Effort (Mean)

Technical skill required	4.08	3.92
Physical effort required	3.46	3.46

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.15	3.85
Outcome depends on the skill and judgment of physician	4.23	3.92
Estimated risk of malpractice suit with poor outcome	4.08	3.77

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.92	3.62
Intra-Service intensity/complexity	4.00	3.77
Post-Service intensity/complexity	3.69	3.42

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 25077 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of forearm and/or wrist area) will be deleted in 2010 and replaced by two new codes (P46 and P47). During the Harvard study, 10 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends an RVW that is midway between the survey 25th percentile and median to place this code in correct rank order with the rest of the family of subfacial codes. Additionally, this value has been *adjusted* (decreased) to 12.75 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.055. This is greater than the IWPUT for the reference code 25515, and reflects the more demanding deep resection.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

CPT Code:25078 Tracking Number P47 Specialty Society Recommended RVU: **17.48**

Global Period: 090 RUC Recommended RVU: **17.48**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of forearm and/or wrist area; 3 cm or greater

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old male presents with a 7 cm malignant fibrous histiocytoma of the flexor muscles of the mid-forearm. At operation, the tumor and adjacent soft tissue are resected.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 10% , Kept overnight (less than 24 hours) 29% , Admitted (more than 24 hours) 60%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 71%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review imaging, pathology and laboratory studies; with special attention to review of x-ray, CT, MRI, bone scan, PET scan and arteriograms, as well as consulting with radiology regarding margins. Communicate with plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on the upper arm. Prep and drape the arm. Scrub and gown. Perform surgical "time out" with operating surgical team. Elevate the arm and inflate the pneumatic tourniquet.

Description of Intra-Service Work: A volar longitudinal incision is made from the elbow crease to about 10 cm above the wrist including an elliptical incision around the previous biopsy track to keep this en bloc with the specimen. Dissection is then carried through the skin and subcutaneous tissues angling away from the biopsy track to avoid entering tissues contaminated by the initial biopsy. The deep fascia is then incised longitudinally and again includes an ellipse around the biopsy track. Dissection is then carried in medial and lateral directions to form appropriate flaps and facilitate deep dissection. Perforating vessels are encountered and are ligated and incised. Proximally, the radial and ulnar arteries as well as the median and ulnar nerves are identified and dissection is carried adjacent to these structures to establish a plane of dissection which preserves them but remains in normal tissues outside of tumor. Several perforating vessels leading to the tumor are ligated and incised. In the proximal portion of the surgical field, the involved flexor

muscles are exposed above the proximal extent of the tumor. These structures are then incised to establish a proximal margin well beyond tumor extension. At this point the neuro-vascular structures are again identified. They are carefully dissected and separated from the adjacent tumor and intended plane of dissection. Several motor branches are seen to run into the tumor and can not be preserved so these branches are individually ligated and incised. Other motor branches are noted to bypass the tissues involved in the tumor and these are protected and preserved. Dissection is then carried along the medial and lateral aspects of the tumor keeping normal tissue between the tumor and the plane of dissection. Several perforating vessels are again encountered and these are ligated and incised. Preoperative imaging studies are reviewed during the procedure to verify intended planes of dissection and proximity to neuro-vascular structures. Once the tumor has been dissected laterally, medial dissection is then begun and the tumor and surrounding tissues are gently lifted from the wound from proximal to distal. Further perforating vessels encountered and are ligated and incised. Further dissection is carried distally until the circumferential dissection is beyond the distal extent of the tumor. At this point, the involved flexor muscles are transected 2 cm from the furthest extent of tumor as determined by imaging studies and clinical impression. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. The tourniquet is let down and hemostasis is obtained and drains are left deep in the wound. A multilayered closure is then performed.

Description of Post-Service Work: Apply soft dressing and splint to hold the wrist in neutral alignment. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an exam, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent day(s), review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of sling. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management reconstruction. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 25077 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of forearm and/or wrist area) will be deleted in 2010 and replaced by two new codes (P46 and P47). During the Harvard study, 10 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 17.48 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.070. This is less than the IWPUT for the reference code 24363. The RVW reflects less intra-op time and total work compared with the reference code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made excising the old biopsy tract. Medial and lateral skin flaps are raised. The tumor is removed en bloc, including necessary surrounding structures. Frozen sections are taken from the surrounding tissue. The margins and tumor are sent to pathology. Additional excision is carried out as necessary to obtain a clear margin. The tourniquet is released and meticulous hemostasis is achieved using a bipolar electrocautery. The wound is inspected and irrigated. The wound is closed.

Description of Post-Service Work: Apply soft dressing and splint to hold the wrist in neutral alignment. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery

outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary c or referring physician of discharge plans. All appropriate medical records are completed, including discharge summa and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for several more visits through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures and drain; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational therapy and assess functional recovery are carefully monitored. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

SURVEY DATA

Pre-Service intensity/complexity	4.00	2.63
Intra-Service intensity/complexity	4.25	3.38
Post-Service intensity/complexity	3.50	2.75

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 26117 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of hand or finger) will be deleted in 2010 and replaced by two new codes (P53 and P54). During the Harvard study, 12 orthopaedic surgeons were surveyed. Hand surgery and plastic surgery were not included in the review. Pre and post times were predicted. No positioning time was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 9.95 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.058. This is similar to the IWPUT for the reference code 25447. The RVW reflects less intra-op time and but more total work compared with the reference code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 26117

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:26118 Tracking Number P54 Specialty Society Recommended RVU: **14.57**

Global Period: 090 RUC Recommended RVU: **14.57**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of hand or finger; 3 cm or greater

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old male presents with a 4 cm epithelioid sarcoma in the abductor pollicis brevis and flexor pollicis brevis. At operation, the tumor and adjacent soft tissue are excised.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 30% , Kept overnight (less than 24 hours) 38% , Admitted (more than 24 hours) 33%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 88%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made excising the old biopsy tract. Medial and lateral skin flaps are raised. The tumor is removed en bloc, including necessary surrounding structures. Frozen sections are taken from the surrounding tissue. The margins and tumor are sent to pathology. Additional excision is carried out as necessary to obtain a clear margin. The tourniquet is released and meticulous hemostasis is achieved using a bipolar electrocautery. The wound is inspected and irrigated. The wound is closed.

Description of Post-Service Work: Apply soft dressing and splint to hold the wrist in neutral alignment. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses, especially monitoring for inflammation and neurovascular status. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical

records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of sling. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 26117 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of hand or finger) will be deleted in 2010 and replaced by two new codes (P53 and P54). During the Harvard study, 12 orthopaedic surgeons were surveyed. Hand surgery and plastic surgery were not included in the review. Pre and post times were predicted. No positioning time was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome – the hand typically swells extensively after this procedure. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW *adjusted* down to 14.57 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.066. This is less than the IWPUT for the reference code 24363. The RVW reflects less intra-op time and total work compared with the reference code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 29807

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27049 Tracking Number P62 Specialty Society Recommended RVU: **21.37**

Global Period: 090 RUC Recommended RVU: **21.37**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of pelvis and hip area; less than 5 cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female presents with a deep 4 cm malignant fibrous histiocytoma of the adductor muscles of the proximal thigh. At operation, the tumor and adjacent soft tissue are resected.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 3% , Admitted (more than 24 hours) 97%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

's moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic and anticoagulation meds. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the trapezius. Medial and lateral subcutaneous flaps are raised. The overlying skin from the biopsy is excised with the tumor. The musculature is exposed around the tumor. The fascia is incised and part of it is included with the specimen in the dissection for proper margins. A radical excision of the adductor longus and superficial adductor brevis is performed. The tumor is removed en bloc, including necessary surrounding structures. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. The deep fascia is inspected for involvement by the tumor as are the ribs and intercostal muscles. If deep margins involved then resection to the periosteum of the ribs and/or peritoneum is carried out. The surgeon then breaks scrub nd carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. Additional excision is

carried out as necessary to obtain a clear margin. Metallic clips are placed to mark the margins for possible postoperative radiotherapy guidance. The wound is inspected and irrigated. Devitalized muscle is debrided. A deep drain is placed. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room sta Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a few days and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Time Segments (Mean)

Pre-Service intensity/complexity	3.63	3.63
Intra-Service intensity/complexity	4.00	3.75
Post-Service intensity/complexity	3.13	3.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27049 (Radical resection of tumor, soft tissue of pelvis and hip area (eg, malignant neoplasm)) will be deleted in 2010 and replaced by two new codes (P62 and P63). During the Harvard study, 8 orthopaedic surgeons were surveyed. Pre and post times were predicted. General surgeons and surgical oncologists, the primary providers were not surveyed. No positioning time was recorded. In 1995, an orthopaedic survey was rejected by the RUC for lack of compelling evidence. However, the failed survey times and visits were maintained in the RUC database. The IWPUT for the current RVW and RUC database times is 0.025, exceptionally low for a deep malignant tumor in the pelvis or hip.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

- Pre-Time: With respect to the pre-service time, we recommend package 4 with no changes.

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 21.37 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.064. This is similar to the IWPUT for the reference code 47380, which involves similar intra-operative work/intensity. The RVW is less than the reference code, reflecting the slightly less intra-op time and differences in post hospital and office work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic and anticoagulation meds. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, an incision is made over the trapezius. Medial and lateral subcutaneous flaps are raised. The overlying skin from the biopsy is excised with the tumor. The musculature is exposed around the tumor. The fascia is incised and part of it is included with the specimen in the dissection for proper margins. A radical excision of the adductor longus adductor brevis and a portion of the adductor magnus are performed. .The tumor is removed en bloc, including necessary surrounding structures. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. Frozen sections are taken from the surrounding tissue. The deep fascia is inspected for involvement by the tumor as are the ribs and intercostal muscles. If deep margins involved then resection to the periosteum of the ribs and/or peritoneum is carried out. The surgeon then breaks scrub and carr the specimen to the pathology department while the anesthesiologist and other operative personnel remain with th patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the

OR, repeats pre-operative scrub and returns to the surgical field. Additional excision is carried out as necessary to obtain a clear margin. Metallic clips are placed to mark the margins for possible postoperative radiotherapy guidance. The wound is inspected and irrigated. Devitalized muscle is debrided. A deep drain is placed. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a few days and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Median Total Time	**608.00**	**617.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.82	3.88
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.88	4.00
Urgency of medical decision making	4.59	3.76

Technical Skill/Physical Effort (Mean)

Technical skill required	4.97	4.65
Physical effort required	4.53	4.59

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.88	4.29
Outcome depends on the skill and judgment of physician	4.88	4.59
Estimated risk of malpractice suit with poor outcome	4.71	4.29

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	4.59	4.24
Intra-Service intensity/complexity	4.82	4.59
Post-Service intensity/complexity	4.65	4.12

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27049 (Radical resection of tumor, soft tissue of pelvis and hip area (eg, malignant neoplasm)) will be deleted in 2010 and replaced by two new codes (P62 and P63). During the Harvard study, 8 orthopaedic surgeons were surveyed. Pre and post times were predicted. General surgeons and surgical oncologists, the primary providers were not surveyed. No positioning time was recorded. In 1995, an orthopaedic survey was rejected by the RUC for lack of compelling evidence. However, the failed survey times and visits were maintained in the RUC database. The IWPUT for the current RVW and RUC database times is 0.025, exceptionally low for a deep malignant tumor in the pelvis or hip.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

- Pre-Time: With respect to the pre-service time, we recommend package 4 with no changes

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 29.14 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.077. This is slightly greater than the IWPUT for the reference code 27134, which involves similar intra-operative time and similar total work/intensity. This procedure is the most difficult and most intense of all the soft tissue tumor resection codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27049

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27329 Tracking Number P72 Specialty Society Recommended RVU: **15.54**

Global Period: 090 RUC Recommended RVU: **15.54**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of thigh or knee area; less than 5 cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male presents with a 3 cm deep malignant fibrous histiocytoma of the hamstring muscles of the mid-posterior thigh. At operation, the tumor and adjacent soft tissue are resected.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 12% , Admitted (more than 24 hours) 88%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 80%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Place tourniquet on the upper thigh. Prep and drape leg. Elevate and exsanguinate leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 7 cm incision is made over the medial hamstrings. Medial and lateral subcutaneous flaps are made. Dissection is carried through the fascia into the semimembranosus muscle. The gracilis and semitendinosus are mobilized and retracted. The sciatic nerve is identified and protected. The semimembranosus muscle is dissected and the tumor is removed en bloc, including necessary surrounding normal tissue. Frozen sections are taken from the surrounding tissue. The margins and tumor are sent to pathology. The pathology report is received and additional excision is carried out as necessary to obtain a clear margin. Careful hemostasis is obtained. The wound is inspected and irrigated. The sciatic nerve is inspected. A deep drain is placed. The deep fascia is closed with interrupted sutures. The superficial wound is closed in layers with interrupted sutures.

Description of Post-Service Work: A compressive dressing is applied in the operating room, the tourniquet is let down and compression is held for 10 minutes on the leg to prevent hematoma formation. A knee immobilizer is applied. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history

and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within two to 3 days and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27329 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of thigh or knee area) will be deleted in 2010 and replaced by two new codes (P72 and P73). During the Harvard study, 9 orthopaedic surgeons were surveyed. Pre and post times were predicted. No positioning time was recorded. Subsequent to the Harvard study, 27329 were submitted by AAOS for review during the first 5-year-review. The RUC agreed that the patient population had become more complex and that the Harvard study did not correctly estimate the intra-operative work. Total work, intra-operative intensity, and levels of hospital and office visits were not considered.. New work values were calculated by adding an additional RVU increment to account for the different in intra-operative time between the Harvard study and the RUC survey. The IWPUT for the current RVW and RUC database times is 0.038, exceptionally low for a deep malignant tumor in the thigh or knee.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: The survey median and 25th percentile result in an IWPUT that is inconsistent with the recommendations for the other small radical soft tissue tumor codes. The consensus committee recommends an RVW that is below the survey 25th percentile to place this code in correct rank order with the rest of the family of subfacial codes. Additionally, this value has been *adjusted* (decreased) to 15.54 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). This RVW ranks this code correctly relative to other small radical resection codes that have the same intra-op time and similar total time and work. Along with the recommended time and visit information, this results in an IWPUT of 0.056. This is less than the IWPUT for the reference code 27447, which involves similar intra-operative time but is more demanding intra-operatively compared with the radical resection of smaller deep tumors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and

accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Place tourniquet on the upper thigh. Prep and drape leg. Elevate and exsanguinate leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 12 cm incision is made over the medial hamstrings. Medial and lateral subcutaneous flaps are made. Dissection is carried through the fascia into the semimembranosus muscle. The gracilis and semitendinosus are mobilized and retracted. The sciatic nerve is identified and protected. The semimembranosus muscle is dissected and the large tumor is removed en bloc, including necessary surrounding normal tissue. Frozen sections are taken from the surrounding tissue. The margins and tumor are sent to pathology. The pathology report is received and additional excision is carried out as necessary to obtain a clear margin. Careful hemostasis is obtained. The wound is inspected and irrigated. The sciatic nerve is inspected. A deep drain is placed. The deep fascia is closed with interrupted sutures. The superficial wound is closed in layers with interrupted sutures.

Description of Post-Service Work: A compressive dressing is applied in the operating room, the tourniquet is let down and compression is held for 10 minutes on the leg to prevent hematoma formation. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also

shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within two to 3 days and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	4.74	3.81

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27329 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of thigh or knee area) will be deleted in 2010 and replaced by two new codes (P72 and P73). During the Harvard study, 9 orthopaedic surgeons were surveyed. Pre and post times were predicted. No positioning time was recorded. Subsequent to the Harvard study, 27329 were submitted by AAOS for review during the first 5-year-review. The RUC agreed that the patient population had become more complex and that the Harvard study did not correctly estimate the intra-operative work. Total work, intra-operative intensity, and levels of hospital and office visits were not considered.. New work values were calculated by adding an additional RVU increment to account for the different in intra-operative time between the Harvard study and the RUC survey. The IWPUT for the current RVW and RUC database times is 0.038, exceptionally low for a deep malignant tumor in the thigh or knee.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 24.28 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.071. This RVW is greater than the reference code and accounts for significantly more intra-operative time and more complex pre and post work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27329

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male presents with a 3.5 cm deep fibrosarcoma of the soleus muscle of the superficial posterior compartment of the calf. At operation, the tumor and adjacent soft tissue are excised.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 6% , Kept overnight (less than 24 hours) 12% , Admitted (more than 24 hours) 82%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

moderate sedation inherent to this procedure in the Hospital/ASC setting? No
ercent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of antibiotic. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Place tourniquet on the proximal thigh. Prep and drape leg. Elevate and exsanguinate leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, an 8 cm posterior longitudinal incision is made around the previous biopsy track to keep this en bloc with the specimen. Dissection is then carried through the skin and subcutaneous tissues angling away from the biopsy track to avoid entering tissues contaminated by the initial biopsy. The deep fascia is then incised longitudinally and again includes an ellipse around the biopsy track. Dissection is then carried in medial and lateral directions to form appropriate flaps and facilitate deep dissection. Perforating vessels are encountered and are ligated and incised. Proximally, the femoral vessels are identified and dissection is carried adjacent these structures to establish a plane of dissection. Several perforating branches leading to the tumor are ligated and ıcised. In the proximal portion of the surgical field, the involved calf muscles are exposed above the proximal extent of the tumor. Incision is carried across these structures to establish a proximal margin well beyond tumor extension. At this point the posterior tibial nerve and vascular bundle are identified. Several motor branches are seen to run into the tumor and can not be preserved so these branches are individually ligated and incised. Other motor branches are noted to bypass the tissues involved in the tumor and these are protected and preserved. Dissection is then carried along the

medial and lateral aspects of the tumor keeping normal tissue between the tumor and the plane of dissection. Preoperative imaging studies are reviewed during the procedure to verify intended planes of dissection and proximity to neuro-vascular structures. Once the tumor has been dissected laterally, medial dissection is then begun and the tumor and surrounding tissues are gently lifted from the wound from proximal to distal. Further dissection is carried dist until the circumferential dissection is beyond the distal extent of the tumor. At this point, the involved calf muscles transected 2 cm from the furthest extent of tumor as determined by imaging studies and clinical impression. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to pathology while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. The wound is inspected and irrigated. A deep drain is placed. The wound is closed in layers with interrupted sutures. Careful monitoring of blood loss during the procedure is necessary with appropriate blood and fluid replacement.

Description of Post-Service Work: A compressive foot dressing is applied in the operating room, the tourniquet is let down and compression is held for 10 minutes on the leg to prevent hematoma formation. Apply splint. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within two to 3 days and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27615 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of leg or ankle area) will be deleted in 2010 and replaced by two new codes (P75 and P76). During the Harvard study, 9 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. No positioning time was recorded. These patients are not typically Medicare-aged and will typically be admitted to the hospital. The Medicare database site of service distribution for this code does not reflect national distribution.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 20 minutes for prone positioning and application of a tourniquet
- Scrub/Dress/Wait: no change

Recommendation: Patients with deep fibrosarcomas will typically be admitted to the hospital. The consensus committee recommends the survey median RVW *adjusted* down to 15.54 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.055. This RVW is slightly greater than the reference code and accounts for significantly more intra-operative time balanced by less post work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27615

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27616 Tracking Number P76 Specialty Society Recommended RVU: **19.42**

Global Period: 090 RUC Recommended RVU: **19.42**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of leg or ankle area; 5 cm or greater

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male presents with a 7.5 cm fibrosarcoma of the muscles of the posterior compartment of the calf. At operation, the tumor and adjacent soft tissue are excised.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 3% , Admitted (more than 24 hours) 97%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of antibiotic. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Place tourniquet on the proximal thigh. Prep and drape leg. Elevate and exsanguinate leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a posterior longitudinal incision is made from the popliteal crease to about 10 cm above the ankle including an elliptical incision around the previous biopsy track to keep this en bloc with the specimen. Dissection is then carried through the skin and subcutaneous tissues angling away from the biopsy track to avoid entering tissues contaminated by the initial biopsy. The deep fascia is then incised longitudinally and again includes an ellipse around the biopsy track. Dissection is then carried in medial and lateral directions to form appropriate flaps and facilitate deep dissection. Perforating vessels are encountered and are ligated and incised Proximally, the femoral vessels are identified and dissection is carried adjacent to these structures to establish a plane dissection. Several perforating branches leading to the tumor are ligated and incised. In the proximal portion of the surgical field, the involved calf muscles are exposed above the proximal extent of the tumor. Incision is carried across these structures to establish a proximal margin well beyond tumor extension. At this point the posterior tibial nerve and vascular bundle are identified. Several motor branches are seen to run into the tumor and can not be preserved so these branches are individually ligated and incised. Other motor branches are noted to bypass the tissues involved in the

tumor and these are protected and preserved. Dissection is then carried along the medial and lateral aspects of the tumor keeping normal tissue between the tumor and the plane of dissection. Preoperative imaging studies are reviewed during the procedure to verify intended planes of dissection and proximity to neuro-vascular structures. Once the tumor has been dissected laterally, medial dissection is then begun and the tumor and surrounding tissues are gently lifted from the wound from proximal to distal. Dissection is carried distally until the circumferential dissection is beyond the distal extent of the tumor. At this point, the involved calf muscles are transected 2 cm from the furthest extent of tumor as determined by imaging studies and clinical impression. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to pathology while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. The wound is inspected and irrigated. A deep drain is placed. The wound is closed in layers with interrupted sutures. Careful monitoring of blood loss during the procedure is necessary with appropriate blood and fluid replacement.

Description of Post-Service Work: A compressive foot dressing is applied in the operating room, the tourniquet is let down and compression is held for 10 minutes on the leg to prevent hematoma formation. Apply splint. Transfer patient to the recovery room. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within two to 3 days and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	4.72	3.44

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 27615 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of leg or ankle area) will be deleted in 2010 and replaced by two new codes (P75 and P76). During the Harvard study, 9 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. No positioning time was recorded. These patients are not typically Medicare-aged and will typically be admitted to the hospital. The Medicare database site of service distribution for this code does not reflect national distribution.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 20 minutes for prone positioning and application of a tourniquet
- Scrub/Dress/Wait: no change

Recommendation: Patients with deep fibrosarcomas will typically be admitted to the hospital. The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 19.42 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.067. This RVW is correctly less than the reference code 27447 and results in an IWPUT that is more consistent with the other large deep soft tissue tumor radical resection code recommendations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

   Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: Review labs and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient supine positioning and padding to stabilize foot. Perform regional block. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An elliptical incision is made on the sole of the foot around the previous biopsy track to keep this en bloc with the specimen. Dissection is then carried through the skin and subcutaneous tissues angling away from the biopsy track to avoid entering tissues contaminated by the initial biopsy. The deep fascia is then incised longitudinally and again includes an ellipse around the biopsy track. Dissection is then carried in medial and lateral directions to form appropriate flaps and facilitate deep dissection. The lateral plantar nerve and artery are identified in the wound, as they come through the medial side of the foot. They are carefully dissected and separated from the adjacent tumor and intended plane of dissection. In the proximal portion of the surgical field, the involved muscles are posed above the proximal extent of the tumor. Dissection is then carried along the medial and lateral aspects of the umor, keeping normal tissue between the tumor and the plane of dissection. Pre-operative imaging studies are reviewed during the procedure to verify intended planes of dissection and proximity to neurovascular structures. Once the tumor has been dissected laterally, medial dissection is then begun and the tumor and surrounding tissues are gently lifted from the wound from proximal to distal. Further dissection is carried distally until the circumferential dissection is beyond the distal extent of the tumor. At this point, the involved intrinsic foot muscles are transected 2 cm from the furthest extent

of tumor as determined by imaging studies and clinical impression. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to pathology while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative f and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon th examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. The wound is inspected and irrigated. A deep drain is placed. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: A compressive foot dressing is applied in the operating room, the tourniquet is let down and compression is held for 10 minutes on the foot to prevent hematoma formation. Apply splint. Transfer patient to the recovery room. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform a problem focused exam, assessing open wound status and drain. Assess neurovascular status. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient neurovascular status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within 2 to 3 days for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropria Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physi therapy and assess functional recovery. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 28046 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of foot) will be deleted in 2010 and replaced by two new codes (P84 and P85). During the Harvard study, 8 orthopaedic surgeons were surveyed. Podiatry, the primary provider of this service, was not involved. Pre and post times were predicted. No positioning time was recorded. These patients are not typically Medicare-aged and will typically be admitted to the hospital. The Medicare database site of service distribution for this code does not reflect national distribution.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 5 minutes. Patient's leg is elevated and foot is stabilized. Opposite extremity is padded. Tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: Patients with deep fibrosarcomas will typically be admitted to the hospital. The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 12.20 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.051. This RVW is slightly greater than the reference code 28299, accounting for the additional facility work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28046

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of foot or toe; 3 cm or greater

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old male presents with a 6 cm synovial sarcoma in the deep plantar space of the foot. At operation, the tumor and adjacent soft tissue are resected.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 14% , Kept overnight (less than 24 hours) 19% , Admitted (more than 24 hours) 67%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 43%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient supine positioning and padding to stabilize foot. Perform regional block. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An elliptical incision is made on the sole of the foot around the previous biopsy track to keep this en bloc with the specimen. Dissection is then carried through the skin and subcutaneous tissues angling away from the biopsy track to avoid entering tissues contaminated by the initial biopsy. The deep fascia is then incised longitudinally and again includes an ellipse around the biopsy track. Dissection is then carried in medial and lateral directions to form appropriate flaps and facilitate deep dissection. The lateral plantar nerve and artery are identified in the wound, as they come through the medial side of the foot. They are carefully dissected and separated from the adjacent tumor and intended plane of dissection. In the proximal portion of the surgical field, the involved muscles are exposed above the proximal extent of the tumor. Dissection is then carried along the medial and lateral aspects of the tumor, keeping normal tissue between the tumor and the plane of dissection. Pre-operative imaging studies are reviewed during the procedure to verify intended planes of dissection and proximity to neurovascular structures. Once the tumor has been dissected laterally, medial dissection is then begun and the tumor and surrounding tissues are gently lifted from the wound from proximal to distal. Further perforating vessels are ligated and incised. Further dissection is carried distally until the circumferential dissection is beyond the distal extent of the tumor. At this point, the involved intrinsic

foot muscles are transected 6 cm from the furthest extent of tumor as determined by imaging studies and clinical impression. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to pathology while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. The wound is inspected and irrigated. A deep drain is placed. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: A compressive foot dressing is applied in the operating room, the tourniquet is let down and compression is held for 10 minutes on the foot to prevent hematoma formation. Apply splint. Transfer patient to the recovery room. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings; assess wound and patient neurovascular status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within 2 to 3 days for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Reconcile medication(s). Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 28046 (Radical resection of tumor (eg, malignant neoplasm), soft tissue of foot) will be deleted in 2010 and replaced by two new codes (P84 and P85). During the Harvard study, 8 orthopaedic surgeons were surveyed. Podiatry, the primary provider of this service, was not involved. Pre and post times were predicted. No positioning time was recorded. These patients are not typically Medicare-aged and will typically be admitted to the hospital. The Medicare database site of service distribution for this code does not reflect national distribution.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 5 minutes. Patient's leg is elevated and foot is stabilized. Opposite extremity is padded. Tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: Patients with deep synovial or fibrosarcomas will typically be admitted to the hospital. The consensus committee recommends the survey median RVW *adjusted* down to 17.24 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.069. This RVW is less than the reference code 27447, accounting for less intra-operative complexity and less facility work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

   Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: After a separately reportable office visit E&M is performed, the decision to remove the lipoma from the scalp is made. Restate planned procedure and obtain informed consent. Verify that all required instruments and supplies are available in the treatment room. Position patient prone with head stabilized. Clip or part and secure scalp hair. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Inject local anesthesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue of the scalp. The tumor is identified and dissected free of surrounding structures and fascial attachments. The wound is inspected and irrigated. After assuring complete hemostasis, the wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a gauze dressing are applied, held in place with a head wrap bandage. The specimen is packaged to send to pathology, along with the appropriate history and information. Discuss surgery outcome with patient. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Write order for pain medication. Dictate operative report and complete medical record documentation. The patient will be examined in the office within one week and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Currently, there is no CPT code for excision of a subcutaneous soft tissue tumor on the face or scalp. According to August 2000 CPT Assistant, when lipomas are excised from skin or subcutaneous tissue, it would be appropriate to utilize the integumentary system excision of benign lesion codes (11400-11446). However, the new code descriptors refer to "tumors" without reference to benign or malignant, so the malignant lesion codes may also apply (11600-11646). Additionally, unlisted code 17999 may have been used.

Pre-Time: With respect to the pre-service time, we recommend package 6 with the following modifications:

- Evaluation: Add 5 minutes – moved from scrub/dress wait category because surgeon will administer local anesthesia.
- Positioning: Add 5 minutes to position patient prone with head stabilized and to clip, part and secure scalp hair.
- Scrub/Dress/Wait: Subtract 5 minutes – moved to evaluation category because surgeon will administer local anesthesia

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 2.91 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.023. The recommended RVW for this 90-day global code is greater than the reference code which is an office-based procedure with a 10-day global period and one post-op office visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) According to August 2000 CPT Assistant, when lipomas are excised from skin or subcutaneous tissue, it would be appropriate to utilize the integumentary system excision of benign lesion codes (11400-11446). However, the new code descriptors refer to "tumors" without reference to benign or malignant, so the malignant lesion codes may also apply (11600-11646). Additionally, unlisted code 17999 may have been used.

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with adjusting the OR table and MAC lines so that the operative site is assessable. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Infiltrate a local anesthetic to reduce postoperative pain.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue of the forehead overlying the mass, taking care to follow relaxed skin tension lines. The tumor is identified and dissected free of surrounding structures and fascial attachments. Dissection is carried out at the level of the tumor capsule, with meticulous technique to avoid injury to neurovascular structures, including branches of the facial nerve. Any such structures within the operative field are identified and preserved. The wound is inspected and irrigated. After assuring complete hemostasis, the wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied, held in place with a head wrap ndage. The specimen is sent to pathology, along with the appropriate history and information. Discuss postoperative are with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient and assess facial nerve function. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare

professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write orders for home medications. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one week and for at least one more visit through the 90-day global period to remove dressings, ass wound healing, and redress wound; remove sutures; and discuss pathology report when available. Order and revi periodic lab and/or imaging, as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Currently, there is no CPT code for excision of a subcutaneous soft tissue tumor on the face or scalp. According to August 2000 CPT Assistant, when lipomas are excised from skin or subcutaneous tissue, it would be appropriate to utilize the integumentary system excision of benign lesion codes (11400-11446). However, the new code descriptors refer to "tumors" without reference to benign or malignant, so the malignant lesion codes may also apply (11600-11646). Additionally, unlisted code 17999 may have been used.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: no change
- Positioning: Add 5 minutes - After induction of anesthesia in supine position, assist with adjusting the OR ta and MAC lines so that the operative site is assessable and the head is stabilized.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 4.37 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.032. This RVW is slightly greater than the reference code 11643, accounting for greater intra-time and the additional office visit within the 90-day global period for P2.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and stabilize the head. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Infiltrate a local anesthetic to reduce postoperative pain.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue of the forehead overlying the mass, taking care to follow relaxed skin tension lines. The frontalis muscle is identified and incised. The tumor is identified and dissected free of surrounding structures and fascial attachments. Dissection is carried out at the level of the tumor capsule, with meticulous technique to avoid injury to neurovascular structures, including branches of the facial nerve. Any such structures within the operative field are identified and preserved. The wound is inspected and irrigated. After assuring complete hemostasis, the wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied, held in place with a head wra bandage. The specimen is sent to pathology, along with the appropriate history and information. Discuss postoperativ care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient and assess facial nerve function. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks

and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write orders for home medications. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one week and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Currently, there is no CPT code for excision of a subfascial soft tissue tumor on the face or scalp. According to August 2000 CPT Assistant, when the lesions are located in deep subfascial or submuscular tissues, the appropriate code from the musculoskeletal system should be reported to describe the work entailed. However, there are no specific codes for excision of face/scalp or back/flank subfascial/intramuscular tumors. Unlisted codes 21499, 21899, 22899 or 20999 may have been reported.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 5 minutes - After induction of anesthesia in supine position, assist with adjusting the OR table and anesthesia lines so that the operative site is assessable and stabilizing the head.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 5.34 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.043. This RVW is less than the reference code 38510 (even though P3 will have an additional office visit in the 90-day global period).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) According to August 2000 CPT Assistant, when the lesions are located in deep subfascial or submuscular tissues, the appropriate code from the musculoskeletal system should be reported to describe the work entailed. However, there are no specific codes for excision of face/scalp or back/flank subfascial/intramuscular tumors. Unlisted codes 21499, 21899, 22899 or 20999 may have been reported.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male undergoes excision of a 6.5 cm tumor in the jaw musculature.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Percent of survey respondents who stated they perform the procedure; In the hospital 95% , In the ASC 0%, In the office 5%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 59% , Kept overnight (less than 24 hours) 39% , Admitted (more than 24 hours) 2%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 75%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of antibiotic bolus and anticoagulation meds. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and stabilize the head with access to the jaw. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Infiltrate a local anesthetic to reduce postoperative pain. A facial nerve monitor is positioned.

Description of Intra-Service Work: A curvilinear incision is made in relaxed skin tension creases anterior to the auricle, extending inferiorly and then anteriorly into the upper neck, three centimeters below and parallel to the lower edge of the mandible. A subplatysmal flap is elevated over the submandibular triangle, more superiorly at the level of the parotid fascia, to expose the submandibular and parotid glands. Peripheral branches of the facial nerve, including the buccal and marginal mandibular branches, are identified and preserved. The flap is further extended anteriorly over the masseter muscle. The muscle is split and the tumor is excised from within the masseter muscle. The wound is inspected ıd irrigated. After assuring complete hemostasis, a deep drain is placed, taking care to avoid contact with facial nerve ›ranches. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied, held in place with a head wrap bandage. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen

and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient and assess facial nerve and jaw function. Monitor for hematoma formation and intraoral edema. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patie family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatm with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing), and special attention to chewing / using jaw muscle. Reconcile medications and write orders for home medications. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within 1-2 days and for several more visits through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove drain and sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for speech/swallowing therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Currently, there is no CPT code for excision of a subfascial soft tissue tumor on the face or scalp. According to August 2000 CPT Assistant, when the lesions are located in deep subfascial or submuscular tissues, the appropriate code from the musculoskeletal system should be reported to describe the work entailed. However, there are no specific codes for excision of face/scalp or back/flank subfascial/intramuscular tumors. Unlisted codes 21499, 21899, 22899 or 20999 may have been reported.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 5 minutes After induction of anesthesia in supine position, assist with adjusting the OR tabl and anesthesia lines so that the operative site is assessable and stabilizing the head.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 7.53 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.052. This RVW is greater than the reference code 38510, taking into account more intra-op time and more post-op visits.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) According to August 2000 CPT Assistant, when the lesions are located in deep subfascial or submuscular tissues, the appropriate code from the musculoskeletal system should be reported to describe the work entailed. However, there are no specific codes for excision of face/scalp or back/flank subfascial/intramuscular tumors. Unlisted codes 21499, 21899, 22899 or 20999 may have been reported.

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

.f no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:21932 Tracking Number P15 Specialty Society Recommended RVU: **9.71**

Global Period: 090 RUC Recommended RVU: **9.71**

CPT Descriptor: Excision, tumor, soft tissue of back or flank, subfascial (eg, intramuscular); less than 5 cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old male undergoes excision of a 4 cm tumor in the paraspinal musculature of the back.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 44% , Kept overnight (less than 24 hours) 44% , Admitted (more than 24 hours) 12%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 94%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies with special attention to review of spinal x-ray, CT, MRI, MRA. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Local anesthesia is infiltrated into the marked incision site as preemptive analgesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue over the lesion. Subcutaneous flaps are raised with electrocautery. The paraspinal muscle is exposed around the tumor. The tumor is excised along with surrounding muscle using electrocautery and dissection. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. Hemostasis is secured with electrocautery and sutures where needed. The wound is inspected and irrigated. Devitalized muscle is debrided. Where possible, the muscle fascial defect is approximated. A Penrose drain is placed in the cavitary defect. The wound is closed in layers with interrupt sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write

brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a week and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Order medications as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	2.15	2.10

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21930 (Excision, tumor, soft tissue of back or flank) will be deleted in 2010 and replaced by four new codes (P13, P14, P15, and P16). During the Harvard study, 12 general surgeons were surveyed only for intra-operative time. Pre and post times were predicted. This prediction resulted in no positioning time, no facility post-work (even though the code is typically performed in a facility), and one office visit (even though the procedure will typically require at least two office visits during the 90-day global period). The prediction also placed the details for this code similar to the smallest subcutaneous excision details per the current survey (P13). The time and visit information for 21930 does not represent larger and/or deeper tumors. Further, without requiring a RUC survey in 1995 during the first 5-year-review, the code was reduced based on a comment letter.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW *adjusted* down to 9.71 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.055. This is similar to the IWPUT for the reference code 15100, which has less intra-operative time, but the same total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

REQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21930

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies with special attention to review of spinal x-ray, CT, MRI, MRA. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Local anesthesia is infiltrated into the marked incision site as preemptive analgesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue over the lesion. Subcutaneous flaps are raised with electrocautery. The musculature is exposed around the tumor. The fascia is incised and part of it is included with the specimen in the dissection for proper margins. The tumor is excised along with surrounding muscle using electrocautery and dissection. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. The deep fascia is inspected for involvement by the tumor as are the ribs and intercostal muscles. If deep margins involved then resection to the periosteum of the ribs is carried out. Hemostasis is secured with electrocautery and sutures where needed. The wound is inspected and irrigated. Devitalized muscle is debrided. Where possible, the muscle fascial defect is approximated. A Penrose drain is placed in the cavitary defect. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings and soft brace. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, includ neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a week and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Order medications as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record

Outcome depends on the skill and judgment of physician	4.27	3.64
Estimated risk of malpractice suit with poor outcome	3.91	3.64

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.82	3.45
Intra-Service intensity/complexity	4.00	3.45
Post-Service intensity/complexity	3.00	2.91

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21930 (Excision, tumor, soft tissue of back or flank) will be deleted in 2010 and replaced by four new codes (P13, P14, P15, and P16). During the Harvard study, 12 general surgeons were surveyed only for intra-operative time. Pre and post times were predicted. This prediction resulted in no positioning time, no facility post-work (even though the code is typically performed in a facility), and one office visit (even though the procedure wi' typically require at least two office visits during the 90-day global period). The prediction also placed the details fc this code similar to the smallest subcutaneous excision details per the current survey (P13). The time and visit information for 21930 does not represent larger and/or deeper tumors. Further, without requiring a RUC survey in 1995 during the first 5-year-review, the code was reduced based on a comment letter.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW *adjusted* down to 12.63 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.069. This is less than the IWPUT for the reference code 38745, which has the same intra-operative time and less total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

SUMMARY OF RECOMMENDATION

CPT Code:22902 Tracking Number P19 Specialty Society Recommended RVU: **4.34**

Global Period: 090 RUC Recommended RVU: **4.34**

CPT Descriptor: Excision, tumor, soft tissue of abdominal wall, subcutaneous; less than 3 cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old female undergoes excision of a 2 cm tumor on her abdominal wall.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 82% , In the ASC 0%, In the office 18%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 93% , Kept overnight (less than 24 hours) 7% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 50%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Local anesthesia is infiltrated into the marked incision site as preemptive analgesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue over the lesion. Subcutaneous flaps are raised with electrocautery and hemostasis is controlled. The tumor is excised along with proper margin of tissue. Hemostasis is secured with electrocautery and sutures where needed. Small lymphatic channels are ligated. The wound is inspected and irrigated. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are

completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one week and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Order medications as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Currently, there is no CPT code for subcutaneous excision of an abdominal wall soft tissue tumor. According to August 2000 CPT Assistant, when lipomas are excised from skin or subcutaneous tissue, it would be appropriate to utilize the integumentary system excision of benign lesion codes (11400-11446). However, the new code descriptors refer to "tumors" without reference to benign or malignant, so the malignant lesion codes may also apply (11600-11646). Additionally, unlisted code 17999 may have been used.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: No change in time.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends an RVW that is midway between the survey 25th percentile and median to place this subcutaneous code in correct rank order with the rest of the family of subcutaneous codes. Additionally, this value has been *adjusted* (decreased) to 4.34 RVWs to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.033. This is less than the IWPUT for the reference code 38525, which has the same intra-time and post-work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 8 **% of respondents:** 23.5 %

TIME ESTIMATES (Median)	CPT Code: 22903	Key Reference CPT Code: 38525	Source of Time RUC Time
Median Pre-Service Time	51.00	45.00	
Median Intra-Service Time	50.00	45.00	
Median Immediate Post-service Time	20.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	19.0	19.00	
Median Office Visit Time	39.0	39.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**179.00**	**178.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	2.75	2.50
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.50	2.63
Urgency of medical decision making	2.88	3.13

Technical Skill/Physical Effort (Mean)

Technical skill required	3.38	3.25
Physical effort required	3.25	3.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.38	3.50
Outcome depends on the skill and judgment of physician	3.63	3.75
Estimated risk of malpractice suit with poor outcome	3.50	3.50

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.88	3.25
Intra-Service intensity/complexity	3.13	3.00
Post-Service intensity/complexity	2.63	2.88

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Currently, there is no CPT code for subcutaneous excision of an abdominal wall soft tissue tumor. According to August 2000 CPT Assistant, when lipomas are excised from skin or subcutaneous tissue, it would be appropriate to utilize the integumentary system excision of benign lesion codes (11400-11446). However, the new code descriptors refer to "tumors" without reference to benign or malignant, so the malignant lesion codes may also apply (11600-11646). Additionally, unlisted code 17999 may have been used.

- Pre-Time: With respect to the pre-service time, we recommend package 3 with no changes.

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 6.31 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended tir and visit information, this results in an IWPUT of 0.059. This is similar to the IWPUT for the reference code 38525, which has slightly less intra-time and the same total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) According to August 2000 CPT Assistant, when lipomas are excised from skin or subcutaneous tissue, it would be appropriate to utilize the integumentary system excision of benign lesion codes (11400-11446). However, the new code descriptors refer to "tumors" without reference to benign or malignant, so the malignant lesion codes may also apply (11600-11646). Additionally, unlisted code 17999 may have been used.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Specialty Frequency Percentage %

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Excel File for all soft tissue tumor codes will be provided.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:22904 Tracking Number P23 Specialty Society Recommended RVU: **16.51**

Global Period: 090 RUC Recommended RVU: **16.51**

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of abdominal wall; less than 5 cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male presents with a 3 cm sarcoma in the rectus abdominus muscle. At operation, the tumor and adjacent soft tissue are resected.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 6% , Admitted (more than 24 hours) 94%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies with special attention to review of x-ray, CT, MRI, MRA. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic and anticoagulation. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the trapezius. Medial and lateral subcutaneous flaps are raised. The overlying skin from the biopsy is excised with the tumor. The musculature is exposed around the tumor. The fascia is incised and part of it is included with the specimen in the dissection for proper margins. The lateral border of the rectus abdominus is identified. The muscle is freed from the underlying oblique muscles but the superficial portion of the oblique transverse abdominus is resected with the tumor. The tumor is removed en bloc, including necessary surrounding structures. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. The surgeon then breaks scrub and carries the specimen to the pathology department while t anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability o the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the

surgical field. The deep fascia is inspected for involvement by the tumor as are the ribs and intercostal muscles. If deep margins involved then resection to the periosteum of the ribs and/or peritoneum is carried out. Additional excision is carried out as necessary to obtain a clear margin. Metallic clips are placed to mark the margins for possible postoperative radiotherapy guidance. The wound is inspected and irrigated. Devitalized muscle is debrided. A deep drain is placed. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a few days to check the wound and drain and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order medications as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Currently, there is no CPT code for radical resection of an abdominal wall soft tissue tumor. Previously, these procedures may have been reported using one of the following unlisted codes: 20999, 22999, 49999.

Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement.

For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has ncreased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

- Pre-Time: With respect to the pre-service time, we recommend package 4 with no changes

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 16.51 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.067. This is less than the IWPUT for the reference code 49203 which has more hospital work and is a more complex procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: Review labs, pathology reports and imaging studies with special attention to review of x-ray, CT, MRI, MRA. Communicate with reconstructive surgeon. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic and anticoagulation. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the trapezius. Medial and lateral subcutaneous flaps are raised. The overlying skin from the biopsy is excised with the tumor. The musculature is exposed around the tumor. The fascia is incised and part of it is included with the specimen in the dissection for proper margins. The lateral border of the rectus abdominus is identified. The muscle is freed from the underlying oblique muscles but the superficial portion of the oblique transverse abdominus is resected with the tumor. The tumor is removed en bloc, including necessary surrounding structures. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels e ligated. Frozen sections are taken from the surrounding tissue. The deep fascia is inspected for involvement by the umor as are the ribs and intercostal muscles. If deep margins involved then resection to the periosteum of the ribs and/or peritoneum is carried out. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to

the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. Metallic clips are placed to mark the margins for possible postoperative radiotherapy guidance. The wound is inspected and irrigated. Devitalized muscle is debrided. A deep drain is placed. The wou is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a few days to check the wound and drain and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order medications as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	4.43	3.71

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Currently, there is no CPT code for radical resection of an abdominal wall soft tissue tumor. Previously, these procedures may have been reported using one of the following unlisted codes: 20999, 22999, 49999.

Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement.

For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are routinely resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

- Pre-Time: With respect to the pre-service time, we recommend package 4 with no change.

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 21.37 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.078. The RVW is appropriately greater than the reference code 49203 to account for the additional intra-op time and post-op work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20999, 22999, or 49999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Subject: RUC Work Value Recommendations for Excision of Soft Tissue Tumor Codes

---

Introduction

On behalf of the Musculoskeletal Tumor Society (MSTS), American Academy of Orthopaedic Surgeons (AAOS), American College of Surgeons (ACS), American Society for Surgery of the Hand (ASSH), American Society of Plastic Surgeons (ASPS), American Academy of Otolaryngology-Head and Neck Surgery (AAO-HNS), American Orthopaedic Foot and Ankle Society (AOFAS), and the American Podiatric Medical Association (APMA) are pleased to provide (after 14 years of on-going work) physician work RVU recommendations for four groups of soft tissue tumor codes as identified in the RUC agenda for Jan/Feb 2009:

- Subcutaneous Excision of Soft Tissue Tumors (Tab 4)
- Subfascial Excision of Soft Tissue Tumors (Tab 5)
- Radical Excision of Soft Tissue Tumors (Tab 6)
- New Codes for Excision of Soft Tissue Tumors (Tab 7)

CPT and RUC History

In 1994, the AAOS responded to CMS's first 5-year review request for comment on misvalued codes with a letter that included approximately 1,300 codes. Because a significant portion of the musculoskeletal section of CPT were in an extensive revision process at the same time the Harvard Study results were being sent to CMS for the first physician fee schedule, codes were incorrectly crosswalked and anomalies were created. The comment letter included the results of an Abt study, similar to the Harvard study methodology. The AAOS presented this study to the AMA/RUC Research Subcommittee and it was rejected. The AAOS was allowed to withdraw the original comment and submit a modest list of 83 codes believed to be "most" misvalued for survey and review during the first 5-year review. This reduced list of codes was prepared by the AAOS and 11 national orthopaedic subspecialty organizations and was meant to represent the most egregiously misvalued codes. The MSTS identified five soft tissue codes that were surveyed and presented to the RUC. A sixth soft tissue code was also discussed by the RUC and not changed during this first 5 year review, based on a comment from a CMD. All other soft tissue tumor codes were withdrawn from this first 5-year-review.

After this first 5-year-review process, the MSTS and other surgical specialties that perform the soft tissue tumor excision codes began discussions at CPT, as there were several codes that did not exist for all categories of subcutaneous, intramuscular and radical (ie, face/scalp, abdominal wall, and back/flank). A CPT proposal was drafted by the MSTS and the AAOS, but rejected by several surgical specialties because the proposal did not differentiate tumor size.

The MSTS continued CPT revision dialogue with several surgical specialties after the 2nd 5-year-review; however, because of the low volume for these codes and society staffing and resource limitations related to practice expense review activities, a CPT proposal to address the codes was not prepared.

In 2005, the MSTS and the AAOS submitted 14 soft tissue tumor codes for the third 5-year-review. For all of these codes, the RUC (after seeing this issue raised at two other 5-year-reviews), formally recommended referring the soft tissue codes to CPT for clarification of deep excision and possibly creating new codes to differentiate the codes based on the size and depth of the tumor.

In 2006, the MSTS again began discussions at CPT with surgical specialties to develop a proposal to address these codes. At CPT, the project was expanded to a review of all soft tissue tumor codes (including subcutaneous). Additionally, for all of these codes, a significant amount of time was spent on drafting introductory text to define the different types of tumors (ie, subcutaneous, subfascial/intramuscular, radical, and bone). Please refer to the RUC cover page for this text.

Harvard Study History

Of the 31 current soft tissue tumor codes, only six codes were surveyed during the Harvard Study for all components (pre, intra, and post). The other 25 codes were only surveyed for intra-operative time/work, with pre and post-service work predicted by algorithm. Additionally, six codes were *only* reviewed by general surgeons and 25 codes were *only* reviewed by general orthopaedic surgeons. None of the codes were reviewed by plastic surgeons, otolaryngologists, hand surgeons, or podiatrists – all recognized specialties for Medicare and significant providers of these services. Further, none of these codes were reviewed by the majority of the specialists that actually perform them – general and orthopaedic surgical *oncologists*. This poor review and prediction by Harvard resulted in some nonsensical data. For example, 21557 (radical resection of a neck/thorax malignant neoplasm) has only two low level office visits (ie, 99212) associated with it, but 21555 and 21556 (subcutaneous and intramuscular neck/thorax excision) have more office visits imputed by a contractor for CMS for practice expense purposes. A second example is that only two of the 31 codes include any time for positioning. A third example is that nine of the 31 codes have no facility work indicated, when all of these codes (even by the Medicare database) are primarily performed in a facility setting. These same nine codes also have only one office visit during the 90-day global period "predicted" by the Harvard algorithm. A fourth example is that one code surveyed for intra-time only had a 10-day global period assigned to the package for algorithm prediction of pre and post-work. [Note that all surgical specialties that perform these codes agree that the global period should be 90-days and that a minimum of two office visits will always be required.]

Subcutaneous Excision of Soft Tissue Tumors

P7-215X0	P26-230X1	P49-261X0	P69-273X1
P8-215X1	P34-240X0	P50-261X1	P77-276X0
P13-21930	P35-240X1	P58-270X0	P78-276X1
P14-219X1	P42-250X0	P59-270X1	P86-280X0
P25-230X0	P43-250X1	P68-273X0	P87-280X1

There are 10 CPT codes currently for subcutaneous excision of soft tissue tumors. For CPT 2010, these 10 codes have been split into 20 codes to differentiate the size of the excised lesion. These codes were never presented as misvalued during a 5-Year-Review. At CPT, these codes were added to the review of codes sent to CPT by the RUC. Because these codes were never part of a 5-Year-Review comment letter, the societies involved in the current RUC survey agree these codes should be work neutral. To accomplish this, the survey-based RVW recommendations were reduced by 2.88% (please see attached Table 1).

Subfascial Excision of Soft Tissue Tumors

P9-215X2	P28-230X3	P51-261X2	P71-273X3
P10-215X3	P36-240X2	P52-261X3	P79-276X2
P21-22900	P37-240X3	P60-270X2	P80-276X3
P22-229X2	P44-250X2	P61-270X3	P88-280X2
P27-230X2	P45-250X3	P70-273X2	P89-280X3

There are 10 CPT codes currently for subfascial excision of soft tissue tumors. Nine of these codes were on the RUC agenda during one or more 5-Year-Reviews. So that an anomaly is not created, we recommend that all codes be reviewed. For CPT 2010, these 10 codes have been split into 20 codes to differentiate the size of the excised lesion. We refer the RUC to the SoRs, where detailed compelling evidence is presented specific to each code in the Additional Rationale section, however, in general terms, the following two compelling evidence criteria are cited:

- Evidence that incorrect assumptions were made in the previous valuation of the service. Harvard review of these codes utilized the wrong specialties, not all significant providers of each procedure, and/or incomplete review of codes where pre/and post work was predicted by algorithm resulting in underestimation of relative work.
- Evidence that technology has changed physician work. Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

To maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral, the survey based RVW recommendations for the subfascial codes have been reduced by 2.88% (please see attached Table 2).

Radical Excision of Soft Tissue Tumors

P5-21015	P17-21935	P38-240X4	P53-26117	P72-273X4	P84-28046
P6-210X5	P18-219X4	P39-240X5	P54-261X4	P73-273X5	P85-2804X
P11-21557	P29-23077	P46-25077	P62-270X4	P75-27615	
P12-215X4	P30-230X4	P47-250X4	P63-270X5	P76-2761X	

There are 11 CPT codes currently for radical excision of soft tissue tumors. Six of these codes were on the RUC agenda during one or more 5-Year-Reviews based on submission by AAOS. The other five low volume codes are not performed or rarely performed by orthopaedic surgery and were not included in the Academy comment letters. So that an anomaly is not created, we recommend that all codes be reviewed. For CPT 2010, these 11 codes have been split into 22 codes to differentiate the size of the excised lesion. We refer the RUC to the SoRs, where detailed compelling evidence is presented specific to each code in the Additional Rationale section, however, in general terms, the following two compelling evidence criteria are cited:

- Evidence that incorrect assumptions were made in the previous valuation of the service. Harvard review of these codes utilized the wrong specialties, not all significant providers of each procedure, and/or

incomplete review of codes where pre/and post work was predicted by algorithm resulting in underestimation of relative work.

- Evidence that technology has changed physician work. Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. These deep tumors are typically asymptomatic, and therefore attain large size before coming to attention. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels.

To maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral, the survey based RVW recommendations for the radical codes have been reduced by 2.88% (please see attached Table 3).

New Codes for Excision of Soft Tissue Tumors

P1-210X1	P3-210X3	P15-219X2	P19-229X0	P23-229X3
P2-210X2	P4-210X4	P16-219X3	P20-229X1	P24-229X4

As part of the review of the excision of soft tissue tumor codes, ten new codes that did not previously exist were created – 4 subcutaneous, 4 subfascial, and 2 radical excision codes.

New Subcutaneous Codes: There are four new subcutaneous codes. According to August 2000 CPT Assistant, when lipomas are excised from skin or subcutaneous tissue, it would be appropriate to utilize the integumentary system excision of benign lesion codes (11400-11446). However, the new subcutaneous code descriptors refer to "tumors" without reference to benign or malignant, so the malignant lesion codes may also apply (11600-11646). Additionally, unlisted code 17999 may have been used for the subcutaneous codes. As a "back of the envelope calculation," adjustments were made to the RVWs for the benign/malignant lesion codes to take into account additional work (time and visits) for the new codes based on current survey data. The results indicate that the recommended RVW for the new 90-day global codes indicate neutrality or savings when compared with the 10-day global lesion codes (adjusted for difference in time and one addition office visit). This is a conservative estimate because there are no restrictions on the 10-day global codes for number of office visits after 10 days. Whereas the 90-day codes will include only two visits. As presented on each SoR and to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral, the survey-based RVW recommendations for the new subcutaneous codes have been reduced by 2.88% (please see attached Table 4).

New Subfascial Codes: There are 4 new subfascial/intramuscular codes. According to August 2000 CPT Assistant, when the lesions are located in deep subfascial or submuscular tissues, the appropriate code from the musculoskeletal system should be reported to describe the work entailed. However, there are no specific codes for excision of face/scalp or back/flank subfascial/intramuscular tumors. Unlisted codes 21499, 21899, 22899 or 20999 should have been reported. As presented on each SoR and to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral, the survey-based RVW recommendations for the new subfascial codes have been reduced by 2.88% (please see attached Table 4).

New Radical Codes: There are 2 new radical excision codes. These low frequency codes should have been reported using the unlisted codes 20999, 22999, or 49999. As presented on each SoR and to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral, the

survey-based RVW recommendations for the new subfascial codes have been reduced by 2.88% (please see attached Table 4).

Methodology

The MSTS and the AAOS, along with the ACS, AAO-HNS, ASPS, ASSH, AOFAS, and APMA conducted a full RUC survey for each of the 72 soft tissue tumor codes, with varying involvement. Surveying specialties for each code are shown the Summary of Recommendation forms. Multiple conference calls before, during and after the survey process were held to be certain everyone was involved. We attempted to identify surgeons familiar with the procedures to survey and except for some of the very low volume codes, a minimum of 30 survey responses was obtained and almost all respondents had experience for the codes they were reviewing. In developing our recommendations for pre-service time, we utilized the pre-time packages. For some codes, we also added time in a standardized fashion for positioning beyond supine (eg, prone, lateral, beach chair). For each code, a description of pre-time changes (additions and subtractions) is presented in the rationale section.

All codes were reviewed separately and together to be certain rank order was correct within and between families. Subsequently, based on the adjustment (-3.06%) to the subcutaneous family of codes to maintain work-neutrality, all other survey-based recommendations were reduced / adjusted.

Very few of these codes (primarily small subcutaneous) will be priced in the office setting. Practice expense forms and spreadsheets have been provided.

Frequency and Impact

Although we understand that an estimate for frequency split for current codes and frequency estimate for new codes is important for CMS conversion factor calculations, we find if very difficult to predict with any comfort what the Medicare utilization will be for the soft tissue tumor codes. The typical patient is not Medicare-age for any of these procedures. After querying all specialty participants, we created a table that shows our best attempt to estimate the percentage split of each code into code pairs of small and large tumors. We also included estimates for the new codes. Utilizing the "adjusted" work RVU recommendations and 2007 Medicare frequency data, the estimated Medicare impact for the subcutaneous codes in Tab 4 is zero because these recommendations have been made budget neutral. For the family of subfacial codes in Tab 5, the estimated impact is 48K RVUs. For the family of radical excision of soft tumors in Tab 6, the estimated impact is 49K RVUs. For the new code pairs in Tab 7, the estimated impact will be zero or negative (ie, savings) as these codes represent a shift of reporting from other current codes, including codes with a 10-day global period where multiple E/Ms could be reported after the 10 day period.

Summary

We appreciate the counsel offered at the RUC prefacilitation committee discussions. Specifically, we reduced the RVW recommendations for the subcutaneous codes to maintain work neutrality within that family because those codes were never presented as misvalued at a 5YR. Additionally, we removed additional pre-service *evaluation* time for the radical codes and accepted the pre-time package times. We also appreciate that the prefacilitation committee took time at the last RUC meeting to go over compelling evidence code by code for many of the subfascial and radical codes – accepting the arguments presented. Specifically, that the data for most of the codes is based on a flawed Harvard review of the wrong specialty for intra-time only. With respect to the few codes that were not presented in a 5YR comment letter, the prefacilitation committee agreed that those codes would need to be considered so as not to create rank order anomalies.

We understand that this is a large number of codes that need to be valued relative to each other and more importantly relative to all other codes in the PFS. The participating specialties have spent an extraordinary amount of time developing recommendations that accomplish this task. We hope that the RUC will take the

time necessary to review these codes individually and fairly. A similarly large number of codes came to the RUC at the last 5YR (E/M codes). The process the RUC used to set anchors and work code by code to fit the rest of the codes within the anchors delivered a product that was cohesive and relative to the PFS. This may be a process that can work for the review of this large number of codes.

There are 10 CPT codes currently for subcutaneous excision of soft tissue tumors. For CPT 2010, these 10 codes have been split into 20 codes to differentiate the size of the excised lesion. These codes were never presented as misvalued during a 5 Year Review. To maintain work neutrality, the survey-based RVW recommendations (Col M) were reduced/adjusted by 2.88%.

There are 10 CPT codes currently for subfascial excision of soft tissue tumors. For CPT 2010, these 10 codes have been split into 20 codes to differentiate the size of the excised lesion. Please see the SoR for each code pair that presents the compelling evidence rationale to review these codes under the 5 year review process.

There are 11 CPT codes currently for subfascial excision of soft tissue tumors. For CPT 2010, these 11 codes have been split into 22 codes to differentiate the size of the excised lesion. Please see the SoR for each code pair that presents the compelling evidence rationale to review these codes under the 5 year review process.

1121

There are 4 new subcutaneous codes. To maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral, the recommended RVWs (Col M) have been reduced by 2.88% (Col J). According to August 2000 CPT Assistant, when lipomas are excised from skin or subcutaneous tissue, it would be appropriate to utilize the integumentary system excision of benign lesion codes (11400-11446). However, the new code descriptors refer to "tumors" without reference to benign or malignant, so the malignant lesion codes may also apply (11600-11646). Additionally, unlisted code 17999 may have been used.

As a "back of the envelope calculation," adjustments were made to the RVWs for the benign/malignant lesion codes to take into account additional work (time and visits) for the new codes. The results shown above in Column J indicate that the recommended RVW for the new 90-day global codes indicate neutrality or savings when compared with the 10-day global lesion codes (adjusted for difference in time and one addition office visit). This is a conservative estimate because there are no restrictions on the 10-day global codes for number of office visits after 10 days. Whereas the 90-day codes include only two visits.

16				SUBFASCIAL - SMALL					old rec	RUC REC

There are 4 new subfascial/intramuscular codes. To maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral, the recommended RVWs (Col M) have been reduced by 2.88% (Col J). According to August 2000 CPT Assistant, when the lesions are located in deep subfascial or submuscular tissues, the appropriate code from the musculoskeletal system should be reported to describe the work entailed. However, there are no specific codes for excision of face/scalp or back/flank subfascial/intramuscular tumors. Unlisted codes 21499, 21899, 22899 or 20999 may have been reported.

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus committee of orthopaedic surgeons, general surgeons, surgical oncologists, plastic surgeons, otolaryngologists, foot and ankle orthopaedic surgeons, and podiatrists representing all types of practices and all geographic settings discussed the practice expense details for the new codes shown above. The consensus was that none of these procedures are emergent.

CPT Code: See Below

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The clinical staff completes pre-service diagnostic and referral forms. They call the hospital to schedule space and equipment needed in the facility and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. Clinical staff will provide and review educational materials and information prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carrier out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure.

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities
Discharge management (standard 6 minutes for same day or 12 minutes for overnight/admit) and standard office visit related activities are performed.

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus committee of orthopaedic surgeons, general surgeons, surgical oncologists, plastic surgeons, otolaryngologists, foot and ankle orthopaedic surgeons, and podiatrists representing all types of practices and all geographic settings discussed the non-facility practice expense details for the new codes shown above. The consensus was that none of these procedures are emergent.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The clinical staff completes pre-service diagnostic and referral forms. Clinical staff will provide and review educational materials and information prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carrier out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure.

Intra-Service Clinical Labor Activities:
Clincal staff reviews the chart to be certain all pre-procedure testing and images are available and the H&P is current. The patient will be greeted and gowned and vital signs obtained. The procedure is reviewed. The procedure room is prepared, making certain supplies and equipment necessary are available. Clinical staff assists the physician with prepping, positioning, and providing anesthesia. This is a sterile procedure therefore, once the clinical staff is gloved, they will remain in the room and assist the physician with the entire procedure. After completion of the procedure, clinical staff will monitor the patient; clean the room; clean the surgical instruments; prepare diagnostic forms and send the excised specimen to pathology; check dressings; and provide instructions on wound care, follow-up visits, and prescriptions.

Post-Service Clinical Labor Activities
Standard office visit related activities are performed.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from Five-Year Review
February 2009

Bone Tumors

The American Academy of Orthopaedic Surgery (AAOS) and the Musculoskeletal Tumor Society (MSTS) responded to the Centers for Medicare and Medicaid Services' (CMS) Five-Year Review request for comment on misvalued codes in 1995, arguing that the Hsaio survey had misvalued these services. During the course of this first Five-Year Review process, it became evident that coding changes would be necessary prior to revaluing these services. From 1995-2005, MSTS and AAOS drafted CPT proposals to address issues within the soft tissue tumor excision family and bone tumor family codes but these proposals were rejected by the CPT advisors and/or the CPT Editorial Panel. For the 2005 Five-Year Review, MSTS and AAOS submitted 14 soft tissue tumor codes and 12 bone tumor codes which were ultimately referred again to the CPT Editorial Panel for clarification and creation of new codes to differentiate the codes based on the size and depth of the tumor. In February 2009, the CPT Editorial Panel approved the coding proposal submitted by the Soft Tissue Tumor and BoneWorkgroup which revised and expanded the soft tissue tumor and bone tumor sections to more accurately describe the services being provided and address the concerns raised by the RUC during the Third Five-Year Review.

1150

There are currently 20 codes that describe bone tumor codes. All of these codes were part of the one or more Five-Year Review processes. Between 60-100 musculoskeletal orthopaedic surgeons and orthopaedic surgeons, hand surgeons, podiatrists and foot and ankle surgeons participated in all or some of the surveys. After the results of these providers were tabulated, the associated specialty societies met to discuss the data. The societies presented and the RUC agreed that there is significant compelling evidence as to why these recommendations should not be work neutral. This compelling evidence is that there is evidence that technology has changed the physician work as over the past 10 years significant advances have been made which allow for greater imaging and thus more precise understanding of anatomic location and extent of tissue involvement. Further, for malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This advancement has allowed for increased ability to eradicate tumors in situ at a higher level. While 20 years ago amputation was used most commonly to treat these patients, limb preservation resections have now become the standard treatment of care as currently less than 5% of patients with pelvic and extremity sarcomas receiving amputations. The specialty societies argued and the RUC agreed that the work associated with bone resection procedures has increased dramatically as these procedures are now more technically demanding, prolonged and involve additional risk.

Pelvis

The RUC reviewed the specialty societies' survey results for the eight pelvis radical resection of tumor codes. The specialty societies indicated and the RUC agreed that 10 years ago patients would undergo total leg amputation in cases of bone sarcomas of the pelvis, whereas now limb salvage is an option. The typical pelvis radical resection of tumor patient is usually in the hospital for 7-10 days.

27077

The RUC reviewed the pelvis anchor codes starting with the largest, most complex procedure of this family, code 27077 *Radical resection of tumor; innominate bone, total.* The RUC reviewed the pre-service time and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate as the physician must conduct an additional extensive review of the pathology studies, coordination with radiation therapy, etc. The RUC determined that an additional 17 minutes of pre-positioning time is required to place the patient in the lateral position after anesthesia is administered. The RUC compared 27077 to key reference service 20956 *Bone graft with microvascular anastomosis; iliac crest* (work RVU = 40.93, intraservice time 400 minutes) and determined that the survey median physician time of 400 minutes and work RVU of 45.00 appropriately accounted for the physician time and work required to perform this service and placed this service in the proper rank order. The RUC noted that the survey respondents indicated that 27077 was much more intense than 20956. The RUC further supported a work RVU of 45.00 for 27077 by comparing it to similar service, 20973 *Free osteocutaneous flap with microvascular anastomosis; great toe with web space* (work RVU = 46.95).

1151

The specialty societies indicated and the RUC agreed that four 99231 and four 99232 hospital visits are typical as patients are usually in the hospital for 7-10 days and since limb salvage is possible the patient will need that time to recover in the hospital. The specialty societies also indicated and the RUC agreed that one higher level office visit, 99214, was appropriate as the physician will perform an extensive consultation, review of pathology margins, contact 2-3 consulting physicians, oncologists or radiation oncologists and the visit will last one hour to 1.5 hours. Patients typically have sarcomas and aggressive cancer and a 99214 allows for extensive treatment plans. Additionally the RUC determined that 2-99213 office visits are appropriate because typically these extremity related events require significant physical therapy, joint stability examination and range of motion checks. **The RUC recommends the survey median work RVU of 45.00 for code 27077.**

27076

The RUC reviewed code 27076 *Radical resection of tumor; ilium, including acetabulum, both pubic rami, or ischium and acetabulum* and agreed with the specialty societies that there has been a long standing rank order anomaly between codes 27076 and 27077 (approximately 22.00 difference in RVUs). The RUC reviewed the pre-time and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate as the physician must conduct an additional extensive review of the

pathology studies, coordination with radiation therapy, etc. The RUC determined that an additional 17 minutes of pre-positioning time is required to place the patient in the lateral position after anesthesia is administered. The RUC determined that 27076 required slightly less physician intra-service time than 27077 (360 versus 400, respectively). However, 27076 is slightly more intense than 27077 because of the location and size of large the tumors typically surrounding the areas of the pelvis being removed in this procedure. The RUC compared code 27076 to 27077 and key reference service 20956 *Bone graft with microvascular anastomosis; iliac crest* (work RVU = 40.93, intraservice time 400 minutes). The RUC noted the survey respondents indicated that 27076 is more intense and complex than 20956. Even though the intra-service time is longer for reference service 20956, more mental effort, technical skill and psychological stress is exerted or occurs when performing 27076. The RUC determined that the survey median physician time of 360 minutes and work RVU of 40.00 appropriately accounted for the physician time and work required to perform this service and placed this service in the proper rank order. The RUC agreed with the specialty societies and recommends one less 99231 hospital visit for 27076 than 27077. **The RUC recommends the survey median work RVU of 40.00 for 27076.**

27075

The RUC reviewed code 27075 *Radical resection of tumor; wing of ilium, one pubic or ischial ramus or symphysis pubis* and determined that the physician time and work required will be significantly less than 27076 and 27077 as this procedure is the removal of one portion of the pelvis. Additionally, 27075 requires fewer hospital visits (2-99231 and 3-99232 visits) than 27076 and 27077. The RUC reviewed the pre-time and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate as the physician must conduct an additional extensive review of the pathology studies, coordination with radiation therapy, etc. No additional positioning time is required as the typically the patient is in the supine position for this procedure. The RUC compared code 27075 to key reference service 27134 *Revision of total hip arthroplasty; both components, with or without autograft or allograft* (work RVU = 30.13, intra-service time = 240 minutes) and determined that the physician time required to perform 27075 is slightly more than 270134. The survey respondents also responded that 27075 is more intense and complex than 27134. The RUC determined that a work RVU of 32.50 for 27075 appropriately places this service in the proper rank order within this family of services. **The RUC recommends the survey median work RVU of 32.50 for 27075.**

27078

The RUC reviewed 27078 *Radical resection of tumor; ischial tuberosity and greater trochanter of femur* and determined that the physician time, work and intensity required is similar to 27075. The RUC reviewed the pre-time and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate, as the physician must conduct an additional extensive review of the pathology studies, coordinate with radiation therapy, etc. The RUC determined that an additional 17 minutes of pre-positioning time is required to place the patient in the prone position after anesthesia is administered. The RUC compared code 27078 to 27075 and to key reference service 27134 *Revision of total hip arthroplasty; both components, with or without autograft or*

allograft (work RVU = 30.13, intra-service time = 240 minutes) and determined that the physician intra-service time required to perform these services is the same and the physician work and intensity required is similar. Additionally, 27078 requires the same number of hospital and office visits as 27075. **The RUC recommends the survey median work RVU of 32.00 for 27078.**

Upper Limb

The RUC reviewed the upper limb radical resection of tumor codes. The specialty societies indicated that most patients receiving these procedures have had pre-operative chemotherapy and are catabolic and may have sarcomas pressing on the aortic arch and subclavian. The physician must carefully identify the soft tissue mass as not to damage surrounding viable tissue. Thus, the closer the tumor is to the shoulder the more complex the procedure. The specialty societies indicated that one 99214 office visit is required for each upper limb radical resection of bone tumor codes. The RUC agreed that the number of office visits were appropriate as the physician will discuss pathology, coordinate care, and assess functional rehabilitation and physical therapy.

23200

The RUC reviewed the pre-service time for code 23200 *Radical resection of tumor; clavicle* and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate as the physician must conduct an additional extensive review of the pathology studies, coordination with radiation therapy, etc. The RUC determined that an additional 9 minutes of pre-positioning time is required to place the patient in the lateral position. The RUC then compared 23200 to key reference service 27447 Arthroplasty, *knee, condyle and plateau; medial and lateral compartments with or without patella resurfacing (total knee arthroplasty)* (work RVU = 23.04, intra-service time = 124 minutes) and determined that the physician time and intensity was slightly higher for code 23200. The RUC determined the survey median work RVU of 22.50 and median physician time of 155 minutes appropriately places this service in the proper rank order within this family of services. **The RUC recommends the survey median work RVU 22.50 for 23200.**

23210

The RUC reviewed the pre-service time for code 23210 *Radical resection of tumor; scapula* and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate as the physician must conduct an additional extensive review of the pathology studies, coordination with radiation therapy, etc. The RUC determined that an additional 17 minutes of pre-positioning time is required to place the patient in the prone or lateral position. The RUC then compared 23210 to key reference service 27134 *Revision of total hip arthroplasty; both components, with or without autograft or allograft* (work RVU = 30.13, intra-service time = 240 minutes) and determined that the physician time, work and intensity was slightly lower for code 23210. The RUC noted that the 23210 has a slightly lower work RVU than 27134, as it has a shorter length of stay requiring only one 99231. The RUC

determined the survey 25th percentile work RVU of 27.00 and median intra-service time of 210 minutes appropriately placed 23210 in relativity to 27134. **The RUC recommends the survey 25th percentile work RVU of 27.00 for 23210.**

23220

The RUC reviewed the pre-service time for code 23220 *Radical resection of tumor; proximal humerus* and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate as the physician must conduct an additional extensive review of the pathology studies, coordination with radiation therapy, etc. The RUC determined that an additional 9 minutes of pre-positioning time is required to place the patient in the lateral position. The RUC then compared 23220 to key reference service 27134 *Revision of total hip arthroplasty; both components, with or without autograft or allograft* (work RVU = 30.13, intra-service time = 240 minutes) and determined that the physician time, work and intensity was the same for these procedures. The RUC determined the survey 25th percentile work RVU of 30.00 and median physician time of 240 minutes was appropriate to perform this service. **The RUC recommends the survey 25th percentile work RVU of 30.00 for 23220.**

24150

The RUC reviewed the pre-service time for code 24150 *Radical resection of tumor; shaft or distal humerus* and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate as the physician must conduct an additional extensive review of the pathology studies, coordination with radiation therapy, etc. The RUC determined that an additional 9 minutes of pre-positioning time is required to place the patient in the supine position and position the arm and hand correctly. The RUC then compared 24150 to key reference service 24363 *Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)* (work RVU = 22.47, intra-service time = 150 minutes) and determined that the physician time, work and intensity was the similar for these procedures. The RUC agreed that the survey median work RVU of 23.25 and median physician time of 180 minutes was appropriate to perform this service. **The RUC recommends the survey median work RVU of 23.25 for 24150.**

24152

The RUC reviewed the pre-service time for code 24152 *Radical resection of tumor; radial head or neck* and agreed with the specialty societies that pre-time package 3 – Straightforward Patient/Difficult Procedure was appropriate. The RUC determined that an additional 9 minutes of pre-positioning time is required to place the patient in the supine position and adjust the arm and hand for a clear operative site. The RUC then compared 24152 to key reference service 24363 *Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)* (work RVU = 22.47, intra-service time = 150 minutes) and determined that the physician time, work and intensity was the similar for these procedures. The RUC determined the survey 25th percentile work RVU of 19.78 and median physician time of 150 minutes was appropriate to perform this service. **The RUC recommends the survey 25th percentile work RVU of 19.78 for 24152.**

25170
The RUC reviewed the pre-service time for code 24170 *Radical resection of tumor; radius or ulna* and agreed with the specialty societies that pre-time package 3 – Straightforward Patient/Difficult Procedure was appropriate. The RUC determined that an additional 9 minutes of pre-positioning time is required to place the patient in the supine position and adjust the arm and hand for a clear operative site. The RUC then compared 24170 to key reference service 24363 *Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)* (work RVU = 22.47, intra-service time = 150 minutes) and determined that the physician time, work and intensity is similar for these procedures. The RUC agreed the survey median work RVU of 22.00 and similar total physician time indicates that the work for these two services are the same. **The RUC recommends the survey median work RVU of 22.00 for 25170.**

26250
The RUC reviewed the pre-service time for code 26250 *Radical resection of tumor; metacarpal* and agreed with the specialty societies that pre-time package 2b – Difficult Patient/Straightforward Procedure was appropriate. The specialty societies indicated and the RUC agreed that the survey respondents slightly overestimated the pre-service evaluation time and that time is actually captured in the scrub, dress, and wait time. Therefore, the RUC removed 10 minutes of pre-evaluation time from the established package and added it to the scrub, dress, wait pre-time. The RUC determined that an additional 9 minutes of pre-positioning time is required to place the patient in the supine position and adjust the arm and hand for a clear operative site. The RUC then compared 26250 to key reference service 25447 *Arthroplasty, interposition, intercarpal or carpometacarpal joints* (work RVU = 10.95, intra-service time = 100 minutes) and determined that the physician time, work and intensity is higher for 26250. To further support the survey median work RVU of 15.00, the RUC compared 26250 to 24346 *Reconstruction medial collateral ligament, elbow, with tendon graft (includes harvesting of graft)* (work RVU = 14.97, intra-service time = 120 minutes), which requires similar physician work and intra-service time. The RUC determined the survey median work RVU of 15.00 and median physician time of 120 minutes was appropriate to perform this service. **The RUC recommends the survey median work RVU of 15.00 for 26250.**

26260
The RUC reviewed the pre-service time for code 26260 *Radical resection of tumor; proximal or middle phalanx of finger* and agreed with the specialty societies that pre-time package 2b – Difficult Patient/Straightforward Procedure was appropriate. The specialty societies indicated and the RUC agreed that the survey respondents slightly overestimated the pre-service evaluation time and that time is actually captured in the scrub, dress, and wait time. Therefore, the RUC removed 10 minutes of pre-evaluation time from the established package and added it to the scrub, dress, wait pre-time. The RUC determined that an additional 9 minutes of pre-positioning time is required to place the patient in the supine position and adjust the arm and hand for a clear operative site. The RUC then compared 26260 to key reference service 25447 *Arthroplasty, interposition, intercarpal or carpometacarpal joints* (work RVU =

10.95, intra-service time = 100 minutes) and determined that the physician time, work and intensity is similar for these services. The RUC determined the survey 25th percentile work RVU of 11.00 and median physician time of 90 minutes was appropriate to perform this service. **The RUC recommends the survey 25th percentile work RVU 11.00 for 26260.**

26262

The RUC reviewed the pre-service time for code 26262 *Radical resection of tumor; distal phalanx of finger* and agreed with the specialty societies that pre-time package 1b – Straightforward Patient/Straightforward Procedure was appropriate. The specialty societies indicated and the RUC agreed that the survey respondents slightly overestimated the pre-service evaluation time and that time is actually captured in the scrub, dress, and wait time. Therefore, the RUC removed 5 minutes of pre-evaluation time from the established package and added it to the scrub, dress, wait pre-time. The RUC determined that an additional 9 minutes of pre-positioning time is required to place the patient in the supine position and adjust the arm and hand for a clear operative site. The RUC agreed that in cases with a malignant bone tumor of the finger, it is usually amputated, but in some cases the thumb may be preserved. The RUC then compared 26262 to key reference service 24685 *Open treatment of ulnar fracture, proximal end (eg, olecranon or coronoid process[es]), includes internal fixation, when performed* (work RVU = 8.21, intra-service time = 60 minutes) and determined that the physician time, work and intensity is similar for these services. The RUC compared 26262 to code 28175 *Radical resection of tumor; phalanx of the toe* and to avoid a rank order anomaly the RUC agreed that the 25th percentile work RVU for of 8.13 for 28175 is appropriate for 26262 as it is similar to the survey 25th percentile work RVU of 8.00. The RUC determined that a work RVU of 8.13 and physician time of 60 minutes is appropriate to perform the work required for this procedure. **The RUC recommends a work RVU of 8.13 for 26262.**

1156

Lower Limb

The RUC reviewed the specialty societies' survey results for the lower limb radical resection of tumor codes. The specialty societies indicated now, as opposed to 10 years ago, most patients will receive a total femoral replacement instead of amputation. The typical Medicare patient population may have more metastatic disease of the distal femur or renal cell carcinoma. Patients are typically in the hospital for a week. The lower limb radical resection procedures have similar intensity to the pelvis iliac wing resection, code 27075, but are not as high as the total pelvis resection or pelvis and acetabulum resections 27077 or 27076. The specialty societies indicated that one 99214 office visit is required for each lower limb radical resection of bone tumor codes. The RUC agreed that the number of office visits were appropriate as the physician will discuss pathology, coordinate care, and assess functional rehabilitation and physical therapy.

27365
The RUC reviewed the pre-service time for code 27365 *Radical resection of tumor; femur or knee* and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate, as the physician must conduct an additional extensive review of the pathology studies, coordination with radiation therapy, etc. No additional positioning time is required as typically the patient is in the supine position for this procedure. The RUC then compared code 27365 to key reference service 27134 *Revision of total hip arthroplasty; both components, with or without autograft or allograft* (work RVU = 30.13, intra-service time = 240 minutes) and determined that the physician time required to perform these services is exactly the same and the work required is slightly more intense for 27365. Additionally, the RUC compared 27365 to 27078 and agreed these services are similar, both requiring the same intra-operative time of 240 minutes. However, 27365 is slightly more intense intra-operatively because for this procedure the physician typically must carefully isolate and immobilize the popliteal and femoral arteries. Additionally, 27365 requires the same number of hospital and office visits as 27078. **The RUC recommends the survey median work RVU of 32.00 for 27365.**

27645
The RUC reviewed code 27645 *Radical resection of tumor; tibia* and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate, as the physician must conduct an additional extensive review of the pathology studies, coordination with radiation therapy, etc. No additional positioning time is required as the typically the patient is in the supine position for this procedure. The RUC then compared code 27645 to key reference service 27156 *Osteotomy, iliac, acetabular or innominate bone; with femoral osteotomy and with open reduction of hip* (work RVU = 26.03, intra-service time = 225 minutes) and determined that the physician time, work and intensity is similar for these services. The RUC determined the survey median work RVU of 27.00 and median physician time of 200 minutes appropriately places this procedure in the proper rank order with the other lower limb radical tumor resection services. **The RUC recommends a work RVU of 27.00 for 27645.**

27646
The RUC reviewed 27646 *Radical resection of tumor; fibula* and agreed with the specialty societies that pre-time package 4 – Difficult Patient/Difficult Procedure was appropriate, as the physician must conduct an additional extensive review of the pathology studies, coordination with radiation therapy, etc. The RUC determined that an additional 17 minutes of pre-positioning time is required to place the patient in the lateral position after anesthesia is administered. The RUC then compared code 27646 to key reference service 27447 Arthroplasty, *knee, condyle and plateau; medial and lateral compartments with or without patella resurfacing (total knee arthroplasty)* (work RVU = 23.04, intra-service time = 124 minutes) and determined that the physician time, work and intensity is similar for these services. The RUC determined the survey median and 25th percentile work RVU of 23.00 and median physician time of 180 minutes appropriately places this procedure in the proper rank order with the other lower limb radical tumor resection services. **The RUC recommends the survey median work RVU of 23.00 for 27646.**

27647

The RUC reviewed code 27647 *Radical resection of tumor; talus or calcaneus* and agreed with the specialty societies that pre-time package 3 – Straightforward Patient/Difficult Procedure was appropriate. The RUC determined that an additional 10 minutes of pre-evaluation time was appropriate for extensive additional review of imaging and pathology studies to correctly mark and plan the procedure and consultation with the reconstructive surgeon. The RUC also determined that an additional 17 minutes of pre-positioning time is required to place the patient in the prone position after anesthesia is administered. The RUC then compared code 27647 to key reference service 27580 *Arthrodesis, knee, any technique* (work RVU = 20.90, intra-service time = 150 minutes) and determined the physician time, work and intensity is similar for these services. The RUC determined the survey median work RVU of 20.10 and median physician time of 144 minutes appropriately places this procedure in the proper rank order with the other lower limb radical tumor resection services. **The RUC recommends the survey median work RVU of 20.10 for 27647.**

28171

The RUC reviewed code 28171 *Radical resection of tumor; tarsal (except talus or calcaneus)* and agreed with the specialty societies that pre-time package 3 – Straightforward Patient/Difficult Procedure was appropriate. The RUC determined that an additional 10 minutes of pre-evaluation time was appropriate for extensive additional review of imaging and pathology studies to correctly mark and plan the procedure and consultation with the reconstructive surgeon. The RUC also determined that an additional 17 minutes of pre-positioning time is required to place the patient in the lateral position after anesthesia is administered. The RUC then compared code 28171 to key reference service 27580 *Arthrodesis, knee, any technique* (work RVU = 20.90, intra-service time = 150 minutes) and determined the physician time, work and intensity is slightly lower for 28171. To further support the survey 25th percentile work RVU of 16.25, the RUC compared 28171 to 28415 *Open treatment of calcaneal fracture, includes internal fixation, when performed* (work RVU = 15.96, intra-service time = 120 minutes), which requires similar physician work and intra-service time. The RUC determined the survey 25th percentile work RVU of 16.25 and median physician time of 120 minutes appropriately places this procedure in the proper rank order with the other lower limb radical tumor resection services and reference service. **The RUC recommends the survey 25th percentile work RVU of 16.25 for 28171.**

28173

The RUC reviewed code 28173 *Radical resection of tumor; metatarsal* and agreed with the specialty societies that pre-time package 1b – Straightforward Patient/Straightforward Procedure was appropriate. The RUC determined that an additional 2 minutes of pre-positioning time is required to elevate the patient's leg, stabilize the foot and pad the opposite extremity. The RUC then compared code 28173 to key reference service 28715 *Arthrodesis; triple* (work RVU = 14.40 intra-service time = 130 minutes) and determined the physician time, work and intensity is similar for these services. The RUC determined the survey 25th percentile work RVU of 14.00 and median physician time of 110 minutes appropriately places this procedure in the proper rank order with the other lower limb

radical tumor resection services and reference service. **The RUC recommends the survey 25th percentile work RVU of 14.00 for 28173.**

28175

The RUC reviewed code 28175 *Radical resection of tumor; phalanx of toe* and agreed with the specialty societies that pre-time package 1b – Straightforward Patient/Straightforward Procedure was appropriate. The RUC determined that an additional 2 minutes of pre-positioning time is required to elevate the patient's leg and stabilize the foot. The RUC then compared code 28175 to key reference service 29891 *Arthroscopy, ankle, surgical, excision of osteochondral defect of talus and/or tibia, including drilling of the defect* (work RVU = 9.47 intra-service time = 60 minutes) and determined the physician time, work and intensity is similar for these services. To further support the survey 25th percentile work RVU of 8.13, the RUC compared 28175 to 24685 *Open treatment of ulnar fracture, proximal end (eg, olecranon or coronoid process[es]), includes internal fixation, when performed* (work RVU = 8.21, intra-service time = 60 minutes), which requires similar physician work and intra-service time.The RUC determined the survey 25th percentile work RVU of 8.13 and median physician time of 60 minutes appropriately places this procedure in the proper rank order with the other lower limb radical tumor resection services. Additionally, the RUC agreed that upper limb radical resection of bone tumor code 26262 is equal to this lower limb resection of bone tumor code 28175. **The RUC recommends the survey 25th percentile work RVU of 8.13 for 28175.**

1159

Practice Expense

The practice expense inputs recommended by the specialty in the facility setting were reviewed and agreed upon. **The RUC recommends the attached standard 090-day direct practice expense inputs.**

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:23200 Tracking Number P31 Specialty Society Recommended RVU: **22.50**

Global Period: 090 RUC Recommended RVU: **22.50**

CPT Descriptor: Radical resection of tumor; clavicle

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male presents with an osteosarcoma of the clavicle with its pushing border displacing the subclavian vessels inferiorly. At operation, a radical resection of the clavicle with adjacent soft tissue is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 11% , Admitted (more than 24 hours) 89%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

.s moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with lateral beach chair positioning, exposing the shoulder and stabilizing the patient's torso. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A long incision is made paralleling the clavicle from the midline to the shoulder. The prior biopsy site is ellipsed with the biopsy area staying with the resected specimen. Skin and subcutaneous flaps are developed avoiding entering the tissue plain of the prior biopsy. Deep fascial planes are opened. The brachial plexus is carefully dissected and exposed. The subclavian vein and artery are exposed and dissected away from the tumor. The subclavius muscle stays with the tumor mass about the clavicle. The sterno-clavicular joint is opened and incised. The acromio-clavicular joint is opened and incised. The coracoclavicular ligaments are divided. The strap neck muscles and sternocleidomastoid musculature is divided above the clavicle. The deltoid and pectoralis inferior attachments are divided. The anterior and superior portion first rib region is sacrificed with the adjacent tissue and bony surface going with the tumor specimen to maintain an en bloc tumor resection. During the procedure, preoperative image studies are reviewed to verify intended planes of dissection and proximity of neurovascular bundles. The

specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stabi[redacted] of the patient. In the pathology department, the surgeon then examines the resected specimen with the atten[redacted] pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. Careful homeostasis is obtained and drains are appropriately placed deep in the wound to protect the flaps. A meticulous multilayered wound closure is accomplished.

Description of Post-Service Work: Apply dressings and shoulder immobilizer. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Examine patient, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent day(s), review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of shoulder immobilizer. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functio[redacted] recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provi[redacted] necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ompelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of

these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advance. have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, the patient will be repositioned in beach chair and slightly lateral to expose the shoulder and stabilizing the patient's torso.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW of 22.50. Along with the recommended time and visit information, this results in an IWPUT of 0.077. This RVW is similar to the reference code 27447, which is also a demanding operation, with significant post service work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unliste. code is reviewed) 23200

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:23210 Tracking Number P32 Specialty Society Recommended RVU: **27.00**

Global Period: 090 RUC Recommended RVU: **27.00**

CPT Descriptor: Radical resection of tumor; scapula

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male presents with a chondrosarcoma with its pushing border displacing the scapula outward from the chest wall, but not extending into the glenohumeral joint. At operation, a radical resection of the scapula with adjacent soft tissue is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A longitudinal slightly oblique incision is made vertically down and past the distal tip of the scapula. The prior biopsy site is ellipsed with the biopsy area staying with the resected specimen. Skin and subcutaneous flaps are developed avoiding entering the tissue plain of the prior biopsy. Deep fascial planes are opened. The trapezius and levator superiorly and the rhomboids medially are divided. The teres major and minor are divided laterally. The rotator cuff near the proximal humerus is divided after the deltoid is taken off of the acromion. T suprascapular neurovascular bundle is identified and divided. The glenohumeral joint is disarticulated. The serratu anterior is divided with the adjacent tissue going with the tumor specimen to effect an en bloc tumor resection. During the procedure, preoperative image studies are reviewed to verify intended planes of dissection and proximity of neurovascular bundles. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then

breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If all margins appear satisfactory then the surgeon returns to the OR, repeats pre-operative scrub and returns to the surgical field. Careful homeostasis is obtained and drains are appropriately placed deep in the wound to protect the flaps. A meticulous multilayered wound closure is accomplished.

Description of Post-Service Work: Apply dressings and shoulder immobilizer. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Examine patient, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent day(s), review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of shoulder immobilizer. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of

these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

)ver the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for lateral positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW of 27.00. Along with the recommended time and visit information, this results in an IWPUT of 0.078. This RVW is less than the reference code 27134, which is also a demanding operation that has a greater intra-service time and different, but slightly more post-work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:23220 Tracking Number P33 Specialty Society Recommended RVU: **30.00**

Global Period: 090 RUC Recommended RVU: **30.00**

CPT Descriptor: Radical resection of tumor, proximal humerus

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old male presents with an osteosarcoma of the proximal humerus with its pushing border displacing the axillary artery and lower brachial plexus and brachial nerves medially. The axillary nerve is intimately involved with the tumor. At operation, a radical resection of the proximal humerus with adjacent soft tissue including the deltoid muscle and axillary nerve is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with lateral beach chair positioning, exposing the shoulder and stabilizing the patient's torso. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made from the clavicle over the shoulder down to the 2/3 junction of the distal humerus. The prior biopsy site is ellipsed with the biopsy area staying with the resected specimen. Skin and subcutaneous flaps are developed avoiding entering the tissue plain of the prior biopsy. Deep fascial planes are opened. The brachial plexus is exposed. The subclavian vein and artery are exposed and followed to the axillary region (axillary vein and artery) and are dissected away from the tumor. The deltoid attachments are divided proximally off of the clavicle and acromion or with these bone structures included in the tumor resection. The attachment of the respective muscle groups that make up the rotator cuff (supraspinatus, infraspinatus, subscapular, teres), latissimus dorsi, pectoralis major/minor are divided proximal to the insertion on the humerus away from the tumor mass. The axillary nerve is identified near the plexus and divided. The shoulder joint capsule is divided away from the proximal

humerus. At the mid humeral bony junction, exposure is accomplished without injuring radial, ulnar, median or musculocutaneous nerves. The humerus is divided in the mid shaft area. During the procedure, preoperative image studies are reviewed to verify intended planes of dissection and proximity of neurovascular bundles. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request fo along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. Careful homeostasis is obtained and drains are appropriately placed deep in the wound to protect the flaps. A meticulous multilayered wound closure is accomplished.

Description of Post-Service Work: Apply dressings and shoulder immobilizer. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Examine patient, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent day(s), review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of shoulder immobilizer. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient wil be examined in the office several times through the 90-day global period. Remove dressings, assess wound healing, a redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order an review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes

had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, the patient will be repositioned in beach chair and slightly lateral to expose the shoulder and stabilizing the patient's torso.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW of 30.00. Along with the recommended time and visit information, this results in an IWPUT of 0.078. This RVW is similar to the reference code 27134, which is also a demanding operation, with significant post service work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23220

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national, non-medicare, frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 41
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2006 Medicare Utilization

Specialty orthopaedic surgery Frequency 38 Percentage 92.68 %

Specialty Frequency 0 Percentage 0.00 %

pecialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Exsanguinate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made paralleling the length of the arm from the proximal 1/3 to across the antecubital area down into the forearm. The prior biopsy site is ellipsed with the biopsy area staying with the resected specimen. Skin and subcutaneous flaps are developed avoiding entering the tissue plain of the prior biopsy. Deep fascial planes are opened. Median, ulnar, and radial nerves are identified proximally and distally a followed and dissected away from the tumor mass. The brachial vein and artery are exposed and dissected away fro. the tumor. The elbow joint is opened and the capsule is exposed. The midshaft humerus is exposed. Involved muscle groups (biceps, triceps brachialis) are divided proximally and distally to the tumor. Numerous perforating and named vessels are identified and ligated and incised. The shaft of the humerus is osteotomized. During the procedure, preoperative image studies are reviewed to verify intended planes of dissection and proximity of neurovascular bundles.

The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. Careful homeostasis is obtained and drains are appropriately placed deep in the wound to protect the flaps. A meticulous multilayered wound closure is accomplished.

Description of Post-Service Work: Apply dressings and sling. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Examine patient, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent day(s), review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of sling. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 10 **% of respondents:** 37.0 %

TIME ESTIMATES (Median)	CPT Code: 24150	Key Reference CPT Code: 24363	Source of Time RUC Time
Median Pre-Service Time	72.00	83.00	
Median Intra-Service Time	180.00	150.00	
Median Immediate Post-service Time	30.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	80.0	80.00	
Median Discharge Day Management Time	38.0	38.00	
Median Office Visit Time	102.0	92.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**502.00**	**473.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.56	3.56
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.56	3.56
Urgency of medical decision making	4.56	3.33

Technical Skill/Physical Effort (Mean)

Technical skill required	4.44	3.00
Physical effort required	4.56	4.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.22	3.78
Outcome depends on the skill and judgment of physician	4.56	3.89
Estimated risk of malpractice suit with poor outcome	4.44	3.89

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	4.44	3.33
Intra-Service intensity/complexity	4.33	3.67
Post-Service intensity/complexity	3.78	3.33

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of

these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW of 23.25. Along with the recommended time and visit information, this results in an IWPUT of 0.074. This RVW is less than the reference code 24363, which is also a demanding operation that has a less intra-service time and similar post-work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

REQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 24150

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national, non-medicare, frequency not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 85
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2006 Medicare Utilization

Specialty orthopaedic surgery Frequency 81 Percentage 95.29 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

SUMMARY OF RECOMMENDATION

CPT Code:24152 Tracking Number P41 Specialty Society Recommended RVU: **19.78**

Global Period: 090 RUC Recommended RVU: **19.78**

CPT Descriptor: Radical resection of tumor, radial head or neck

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male presents with a chondrosarcoma of the proximal radial head and neck with its pushing border displacing the radial nerve and the posterior interosseous nerve. At operation, a radical resection of the proximal radius with adjacent soft tissue is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 15% , Admitted (more than 24 hours) 85%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Exsanguinate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made utilizing a Henry approach extending from above the elbow anteriorly and paralleling the proximal radius anterolaterally. The prior biopsy site is ellipsed with the biopsy area staying with the resected specimen. Skin and subcutaneous flaps are developed avoiding entering the tissue plain of e prior biopsy. Deep fascial planes are opened. The radial nerve is followed proximally down towards the radial ead. The supinator is identified. The posterior interosseous nerve is identified. The brachial artery and vein are identified. The elbow joint is opened and incised. The tissues about the midshaft of the radius are opened and incised. The radial collateral ligament is identified and divided extra-periosteally off of the humeral condylar region. The midshaft interval is identified and the radius is divided. During the procedure, preoperative image studies are reviewed to verify intended planes of dissection and proximity of neurovascular bundles. The specimen is then removed from the

field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathol department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologis the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. Careful homeostasis is obtained and drains are appropriately placed deep in the wound to protect the flaps. A meticulous multilayered wound closure is accomplished.

Description of Post-Service Work: Apply dressings and sling. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Examine patient, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent day(s), review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of sling. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordinati telephonic or electronic communication assistance, and other necessary management for reconstruction and furth chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of

these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advance. have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW of 19.78. Along with the recommended time and visit information, this results in an IWPUT of 0.072. This RVW is less than the reference code 24363, which is also a demanding operation with similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Exsanguinate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made in a longitudinal orientation, ellipsing the biopsy tract in a wide en bloc fashion from the elbow, incorporating the biopsy tract, extending the incision to the wrist. The dissection is carried down through the subcutaneous fat maintaining a cuff of tissue surrounding the biopsy tract and tumor. The incision is carried down through the limiting fascia of the forearm, extending down to the wrist. The tumor originates the bone but is associated with a large soft tissue mass that involves the surrounding musculature. The dissectic therefore proceeds through the volar musculature; once again, maintaining a cuff of normal, non-tumor involved muscle on the tumor to maintain a wide margin around the tumor. The flexor carpi radialis and flexor carpi ulnaris, along with the flexor digitorum sublimis and profundus muscles are dissected from the underlying soft tissue component of the bony tumor. The neurovascular bundle, associated with the tumor, is meticulously dissected free from the overlying tumor.

The artery, vein, and nerves are sharply dissected from their sheath maintaining the sheath as a margin on the tumor. The interosseous membrane is approached and identified and then carefully divided in order to mobilize the radius. At this point the dissection is carried over to the dorsal side of the forearm. The same approach is utilized here, dissecting the overlying extensor muscles from the underlying tumor, maintaining a cuff of normal tissue in a wide en bloc fashion. The neurovascular structures here are dissected free from the tumor and maintained to allow functional restoration of the limb. The dissection is carried further distal to the wrist joint. Proximally, the dissection is carried towards the elbow where the joint capsules of both the wrist and elbow are exposed. The remaining capsular structures are then transected being very careful to protect the neurovascular structures (artery, vein, and nerves, both radial and ulna) which lie intimately in contact with the capsular structures. The radius is then elevated forwards to allow for exposure of the forearm. Care is taken to ligate each feeding vessel into the tumor. The dissection is carried proximally in this fashion until the level of the proposed osteotomy dictated by the pre-operative planning is reached. At this point, typically 12 cm. above the wrist, the dissection is carried circumferentially around the entire bone. The bone is then cut with a saw and the remaining soft tissues are dissected free from the specimen. The specimen consists of the skin of the biopsy tract, the underlying subcutaneous fat, fascia, muscle, tumor, bone, ligaments, tendons, and capsular structures, all in one piece, without any contamination of either tumor or prior surgery. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. If positive margins are found, additional resection is required. The wound bed is inspected, bleeding vessels are ligated and the neurovascular structures are re-evaluated to ensure they are intact. During the remainder of the procedure, these structures must be protected from stretch, twisting, retraction, etc. as there is now no bone to provide structure of this limb. The soft tissue reconstruction can be begun once all frozen sections reveal clear margins. Gloves and instruments are changed to prevent any contamination. The muscles are mobilized in order to provide coverage over the remaining bone. The dissection is carried more proximally until the muscles can be rotated to fill in the void left by the tumor. Muscle bellies are repaired to themselves as is the fascia. The fascial layers are closed in a watertight fashion over a drain, followed by closure of the subcutaneous tissues and skin.

Description of Post-Service Work: Apply dressings and sling. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Examine patient, assessing open wound status and drain. Assess neurovascular status. Wound care and close observation are important to avoid or promptly treat compartment syndrome. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent day(s), review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of sling. Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of

these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW of 22.00. Along with the recommended time and visit information, this results in an IWPUT of 0.073. This RVW is less than the reference code 24363, which is also a demanding operation with less intra-operative time, but similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 25170

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national, non-medicare, frequency not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2006 Medicare Utilization

Specialty orthopaedic surgery Frequency 26 Percentage 86.66 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Global Period: 090 RUC Recommended RVU: **15.00**

CPT Descriptor: Radical resection of tumor, metacarpal

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male presents with a chondrosarcoma of the first metacarpal of the thumb with a small soft tissue mass. A radical resection of the first metacarpal is performed with preservation of the thumb.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 36% , Kept overnight (less than 24 hours) 32% , Admitted (more than 24 hours) 32%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 78%

's moderate sedation inherent to this procedure in the Hospital/ASC setting? No
ercent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the dorsal aspect of the first metacarpal. The neurovascular structures are carefully retracted. The extensor mechanism is retracted. Extraperiosteal dissection is carried out around the metacarpal. The metacarpalphalangeal joint is identified and the capsule is incised. The flexor tendon sheath is opened and the flexor pollicis longus is retracted. The first metacarpal is carefully dissected away from the flexor pollicis longus and thenar muscles. The digital nerves and arteries are protected. The carpometacarpal joint is identified and its capsule incised. The metacarpal, the attached soft tissue tumor extension and the involved muscle are removed. The urniquet is released and meticulous hemostasis achieved. The wound is irrigated. A drain is placed in the wound. The ound is closed in layers.

Description of Post-Service Work: Apply soft dressings. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor

nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status... Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical recor and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, ; make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management reconstruction. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

ompelling Evidence

he MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of

these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advance have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 2B with the following modifications:

- Evaluation: Subtract 10 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: Add 10 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome – the hand typically swells extensively after this procedure. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW of 15.00. Along with the recommended time and visit information, this results in an IWPUT of 0.065. This RVW less than the reference code 25447, accounting for less intra-op and total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 26250

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

SUMMARY OF RECOMMENDATION

CPT Code:26260 Tracking Number P56 Specialty Society Recommended RVU: **11.00**

Global Period: 090 RUC Recommended RVU: **11.00**

CPT Descriptor: Radical resection of tumor, proximal or middle phalanx of finger

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old woman presents with a chondrosarcoma of the proximal phalanx of the thumb in her dominant hand. A radical resection of the tumor is performed with preservation of the thumb.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 62% , Kept overnight (less than 24 hours) 23% , Admitted (more than 24 hours) 15%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 83%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the dorsal aspect of the proximal phalanx. The neurovascular structures are carefully retracted. The extensor mechanism is retracted. Extraperiosteal dissection is carried out around the phalanx. The interphalangeal joint is identified and the capsule is incised. The flexor tendon sheath is opened and the flexor pollicis longus is retracted. The proximal phalanx is carefully dissected away from the flexor pollicis longus. The digital nerves and arteries are protected. The metacarpalphalangeal joint is identified and its capsule incised. The phalanx is excised. The tourniquet is released and meticulous hemostasis achieved. The wound is irrigated. A drain is placed in the wound. The wound is closed.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the

operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes

had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends the survey 25th percentile RVW of 11.00. Along with the recommended time and visit information, this results in an IWPUT of 0.059. This RVW is similar to the reference code 25447 which has very similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the radial aspect of the distal phalanx. The neurovascular structures are carefully retracted. The extensor mechanism is retracted. Extraperiosteal dissection is carried out around the phalanx. The interphalangeal joint is identified and the capsule is incised. The flexor tendon sheath is opened and the flexor pollicis longus is retracted. The distal phalanx is carefully dissected away from the flexor pollicis longus, extensor policis longus and nail organ. The digital nerves and arteries are protected.. The phalanx is excised. The tourniquet is released and meticulous hemostasis achieved. The wound is irrigated. A drain is placed in the wound. The wound is 'osed.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the

operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications ; write order for pain medication. Provide necessary care coordination, telephonic or electronic communicat. assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all

of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends a RVW of 8.13. This is very similar to the survey 25th percentile RVW of 8.00 but allows 26262 to be valued the same as the recommended RVW for CPT code 28175 th maintaining rank order between 26262 and 28175. These two codes have virtually the exact same times and therefore, the committee believes their RVW and IWPUTs should be identical as well. The IWPUT is .061. In addition, this RVW is similar to the reference code 24685 which has very similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotics. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A skin incision is made from the pubic symphysis over the inguinal ligament and over the superior bony rim of the pelvis going back posteriorly to the sacro-iliac joint. A second incision is then made over the lateral aspect of the proximal femur extending proximally to the mid lateral aspect of the first incision creating a large laterally based "T". This is carried down sharply through the skin and subcutaneous tissues and hemostasis is obtained. The anterior portion of the incision is then taken down through the inguinal ligament from the pubic symphysis to the anterosuperior iliac spine. The femoral artery and vein are exposed and carefully dissected. Vess loops are carefully placed around the femoral artery and vein in the pelvis so that proximal control can be maintained. The abdominal wall muscles are then dissected extraperiosteally from their insertion on the wing of the ileum. These muscles are retracted proximally. The lateral femoral cutaneous nerve is identified and protected. Dissection is then carried down over the iliacus muscle, which will be left with the resection specimen to form the medial wide margin. In the lower portion of the pelvis, the ureter is palpated and this is facilitated by the previously placed ureteral stent. The

ureter is carefully swept posteriorly and the peritoneum in retracted away from the mass. Dissection is then carried through the iliacus muscle but the psoas muscle is left intact. The femoral nerve is exposed within the anterior aspect of the psoas muscle and protected. Dissection is then carried posteriorly over the posterior aspect of the iliac wing back to the sacro-iliac joint again staying extraperiosteal to keep away form the tumor. The tensor fascia lata, sartorius and rectus femoris muscles originating from the anterior aspect of the pelvis are dissected. A lateral incision is made through the fascia lata and anterior and posterior flaps are fashioned. The gluteus maximus muscle is split in line with its fibers and the gluteus maximus is then separated from the underlying gluteus medius and minimus and is then retracted anteriorly and posteriorly. The gluteus medius is the separated from the underlying gluteus minimus, which is maintained with the specimen to serve as the lateral wide margin. This dissection is carried back to the sciatic notch and the gluteal vessels and nerves to the medius and maximus are preserved while the branches to the minimus are sacrificed. The sciatic notch is then exposed from within the pelvis and from without. A large Penrose drain is then drawn through the sciatic notch to protect the underlying vessels and nerves. The sciatic nerve is then dissected inside and outside the pelvis so that it is visualized throughout this region. The posterior aspect of the ileum is then exposed followed by exposure of the sacral ala by dissection of the paraspinous muscles to expose the posterior aspect of the sacral ala. Final exposure of the planned areas for the bone cuts above the acetabulum and along the sacrum are performed. A Steinman pin is then place through the supra-acetabular bone perpendicular to the long axis of the body with a second pin through the ala to outline the bone cuts and to make sure that the cuts will go through normal uninvolved bone to guarantee wide bone margins. With the portable x-ray obtained and showing the pins in good position, an oscillating saw is then used to make the bone cuts which are completed with a curved periosteal elevator and a mallet so as not to damage the underlying nerves and vessels. Once these cuts are completed, the ileum can be mobilized by careful incision of the remaining soft tissue attachments. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. The surgeon then returns to the operative suite and scrubs in to the operation. Careful hemostasis is then obtained. And the wound is copiously irrigated. Two suction drains are then left deep in the wound and brought out proximally. The gluteus medius and maximus are repaired to the abdominal wall muscles with nonabsorbable suture. The remaining soft tissue is then repaired in layers with interrupted sutures and the skin with skin staples.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff... Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

1. Evidence that technology has changed physician work (i.e., diffusion of technology).

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are

only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer. Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

2. Evidence that incorrect assumptions were made in the previous valuation of the service.
Of the 20 malignant bone tumor codes, only one code was surveyed during the Harvard study for all components (pre, intra, and post), and the survey consisted of only six general orthopaedic surgeons. The other 19 codes were only surveyed for intra-operative time/work, with pre and post-service work predicted by algorithm. The current Medicare frequency for these codes ranges from a low of four to a high of 417, with most of the codes performed less than 100 times annually. We believe it is fair to say that the six general orthopaedic surgeons surveyed during the Harvard study were not likely familiar and fit to rate these major procedures that are most often referred to musculoskeletal tumor specialists. Subsequent to the Harvard study, 27075 was submitted by MTS and AAOS for review during the second 5-year-review. During this review of physician work, the RUC reviewed all components of work. The RUC agreed that the patient population had become more complex and that the Harvard study did not correctly estimate physician work for these codes. During the current survey process, we find that the intra-operative time and length of stay has decreased slightly for 27075. For this reason, we are asking for this code to be reviewed, as we are recommending that the work RVUs for 27075 be decreased slightly so that a rank order anomaly is not created with the other bone tumor codes.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: no change
- Scrub/Dress/Wait: no change
-

Hospital Visits: With respect to the hospital visits for 27075, we are recommending 5 total hospital visits, 2 at a level 99231 and 3 at a level of 99232. Our survey respondents indicated one visit would be at a level of 99233. However, the consensus committee felt that 3-99232 was the more appropriate recommendation.

Recommendation: The consensus committee recommends the survey median RVW of 32.50. This is less than the current RVW. Along with the recommended time and visit information, this results in an IWPUT of 0.083. This RVW is slightly greater than the reference (and MPC) code 27134 which has less total time and a similar IWPUT.

SERVICES REPORTED WITH MULTIPLE CPT CODES

Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: The incision starts at the medial aspect of the inguinal ligament and goes laterally over the proximal border of the pelvis and posteriorly to the SI joint with a second arm of the incision coursing distally from the mid lateral portion of the previous incision to a points 10 cm below the greater trochanter, ellipsing the biopsy tract in a wide en bloc fashion. The dissection is carried down through the subcutaneous fat maintaining a cuff of tissue surrounding the biopsy tract and tumor. The incision is carried down through the limiting fascia of the groin and pelvis to the fascia of the gluteus maximus and the inguinal ligament. The inguinal ligament is opened and the femo neurovascular bundle is exposed taking great care to protect these structures. The sartorius and tensor fascia la muscles are incised extra periosteally and the anterior aspect of the pelvis is exposed keeping normal tissues between the tumor and the plain of dissection. The gluteus maximus muscle is the split along the lateral potion of the proximal thigh and this dissection is carried proximally so that this can be separated from the underlying gluteus medius. The gluteus maximus is then retracted posteriorly as its proximal origin is removed from the ileum. The gluteus medius and

minimus are kept with the specimen to effect a wide margin laterally. The iliacus and psoas muscles are divided in the pelvis after first dissecting the femoral vessels in this region to effect a wide margin on the interior of the pelvis. Posteriorly, the sciatic nerve must be found and protected from undue tension or retractors. The abductor muscles are then divined from the greater trochanter and the femur is internally rotated. The short external rotator muscles are then ivided and perforating vessels are ligated. The hip capsule is then dissected circumferentially and then incised keeping away from the pelvic origin which is in close proximity to tumor. The osteotomies of the posterior ileum, pubis and ischium are carefully planned and scribed on the boney pelvis. The ligamentum teres is then incised. The osteotomies are then performed with an oscillating saw and completed with a cob and a mallet. Soft tissue attachments still connect the specimen to the underlying structures and these are carefully divided. The hip is then dislocated and the specimen is lifted gently out of the wound as the remaining soft tissue attachments are divided. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. The surgeon then returns to the operative suite and scrubs in to the operation. Hemostasis of the wound is secured. The remaining bone edges are rasped to a fine finish. Irrigation is performed. The gluteus maximus is repaired and re-approximated to itself. The fascia is closed over a drain. Subcutaneous tissues and skin are closed in the usual fashion.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff... Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing eurovascular status and drain. Order and review imaging as necessary. Consider relevant data, options, and risks and evise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	5.00	4.50

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

1. Evidence that technology has changed physician work (i.e., diffusion of technology).

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor

revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer. Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

2. Evidence that incorrect assumptions were made in the previous valuation of the service.
Of the 20 malignant bone tumor codes, only one code was surveyed during the Harvard study for all components (pre, intra, and post), and the survey consisted of only six general orthopaedic surgeons. The other 19 codes were only surveyed for intra-operative time/work, with pre and post-service work predicted by algorithm. The current Medicare frequency for these codes ranges from a low of four to a high of 417, with most of the codes performed less than 100 times annually. We believe it is fair to say that the six general orthopaedic surgeons surveyed during the Harvard study were not likely familiar and fit to rate these major procedures that are most often referred to musculoskeletal tumor specialists. Subsequent to the Harvard study, 27076 was submitted by MTS and AAOS for review during the first 5-year-review. The RUC agreed that the patient population had become more complex and that the Harvard study did not correctly estimate the intra-operative work. Total work, intra-operative intensity, and levels of hospital and office visits were not considered – only difference in intra-operative time. New work values were calculated by adding an additional RVU increment to account for the different in intra-operative time between the Harvard study and the RUC survey. The calculated RVW resulted in an IWPUT of 0.022. If the correct level of hospital visits were considered and corrected, a negative IWPUT results. The current survey provides time and visit data from surgeons familiar with these procedures. Intra-operative time for both codes is significantly greater than recorded in 1995. For this reason, we are asking for these codes to be reviewed at this time for all survey components (pre, intra, post).

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for lateral positioning
- Scrub/Dress/Wait: no change

Hospital Visits: With respect to the hospital visits for 27076, we are recommending 7 total hospital visits, 3 at a level 99231 and 4 at a level of 99232. Our survey respondents indicated one visit would be at a level of 99233. However, the consensus committee felt that 4-99232 was the more appropriate recommendation.

Recommendation: The consensus committee recommends the survey median RVW of 40.00. Along with the recommended time and visit information, this results in an IWPUT of 0.069. This RVW is less than the reference code 20956 which has similar total time and IWPUT, but a different pattern of time and visit details.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include th CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27076

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national, non-medicare, frequency not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 82
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2006 Medicare Utilization

Specialty orthopaedic surgery Frequency 55 Percentage 67.07 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

CPT Code:27077 Tracking Number P66 Specialty Society Recommended RVU: **45.00**

Global Period: 090 RUC Recommended RVU: **45.00**

CPT Descriptor: Radical resection of tumor; innominate bone, total

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old women presents with an osteosarcoma of the acetabulum with extension to the ilium, ischium and the superior pubic ramus to the symphysis. At operation a radical resection of the entire hemipelvis is performed with preservation of the limb.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A skin incision is then made from the pubic symphysis over the inguinal ligament and over the superior bony rim of the pelvis going back posteriorly to the sacro-iliac joint. A second incision is then made over the lateral aspect of the proximal femur extending proximally to the mid lateral aspect of the first incision creating a large laterally based "T". This is carried down sharply through the skin and subcutaneous tissues and hemostasis is obtained. The anterior portion of the incision is then taken down through the inguinal ligament from the pubic symphysis to the anterosuperior iliac spine. The femoral artery and vein are exposed and carefully dissected. Vessel loops are carefully placed around the femoral artery and vein in the pelvis so that proximal control can be maintained. The abdominal wall muscles are then dissected extraperiosteally from their insertion on the wing of the ileum. These muscles are retracted proximally. In the course of doing this, the lateral femoral cutaneous nerve is identified and protected. Dissection is then carried down over the iliacus muscle, which will be left with the resection

specimen to form the medial wide margin. In the lower portion of the pelvis, the ureter is palpated and this is facilitated by the previously placed ureteral stent. The ureter is carefully swept posteriorly and the peritoneum in retracted away from the mass. Dissection is then carried through the iliacus and psoas muscles. The femoral nerve is exposed within the anterior aspect of the psoas muscle and protected. Dissection is then carried posteriorly over the posterior aspect of the iliac wing back to the sacro-iliac joint. The muscles originating from the anterior aspect of the pelvis are then dissected extraperiosteally and these include the tensor fascia lata, sartorius and rectus femoris muscles. The lateral incision is then incised through the fascia lata and anterior and posterior flaps are fashioned. The gluteus maximus muscle is split in line with its fibers and the gluteus maximus is then separated from the underlying gluteus medius and minimus and is then retracted anteriorly and posteriorly. The gluteus medius is the separated from the underlying gluteus minimus, which is maintained with the specimen to serve as the lateral wide margin. This dissection is carried back to the sciatic notch and the gluteal vessels and nerves to the medius and maximus are preserved while the branches to the minimus are sacrificed. The sciatic notch is then exposed from within the pelvis and from without. A large Penrose drain is then drawn through the sciatic notch to protect the underlying vessels and nerves. The sciatic nerve is then dissected inside and outside the pelvis so that it is visualized throughout this region. The posterior aspect of the ileum is then exposed followed by exposure of the sacral ala by dissection of the paraspinous muscles to expose the posterior aspect of the sacral ala. Dissection is then carried around the hip capsule circumferentially and the anterior and posterior circumflex vessels are identified, ligated and incised. The ligamentum teres is incised and the hip joint is dislocated. The insertion of the iliopsoas muscle on the lesser is identified and incised. Dissection is the carried down the outside of the ischium detaching the origin of the hamstring muscles and being careful to remain in the extraperiosteal plane to keep away from the underlying tumor. Dissection is then carried over the pubis and the femoral artery and vein are skeletonized in this area and carefully retracted anteriorly. The inner wall of the pubis is then dissected and the pubis is separated from the bladder in the space of Retzius. The obturator vessels and nerves are visualized in the pelvis and ligated and incised. The origin of the adductor muscles is then dissected extraperiosteally and the obturator vessels and nerves are identified, ligated and incised in the adductor muscles outside the pelvis. A large Penrose drain is place around the pubic symphysis to protect the bladder during subsequent bone cuts. Final exposure of the planned areas for the bone cuts through the pubic symphysis and along the sacrum are performed. An oscillating saw is then used to make the bone cuts, which are then completed with a curved periosteal elevator and a mallet so as not to damage the underlying nerves and vessels. Once these cuts are completed, the innominate bone can be mobilized by careful incision of the remaining soft tissue attachments. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. The surgeon then returns to the operative suite and scrubs in to the operation. Careful hemostasis is then obtained and the wound is copiously irrigated. Two suction drains are then left deep in the wound and brought out proximally. The gluteus medius and maximus are repaired to the abdominal wall muscles with nonabsorbable suture. The remaining soft tissue is then repaired in layers with interrupted sutures and the skin with skin staples.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff... Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including time restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, and redress wound.

Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and furt' chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

'ompelling Evidence

. Evidence that technology has changed physician work (i.e., diffusion of technology).

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes

had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer. Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

2. Evidence that incorrect assumptions were made in the previous valuation of the service.
Of the 20 malignant bone tumor codes, only one code was surveyed during the Harvard study for all components (pre, intra, and post), and the survey consisted of only six general orthopaedic surgeons. The other 19 codes were only surveyed for intra-operative time/work, with pre and post-service work predicted by algorithm. The current Medicare frequency for these codes ranges from a low of four to a high of 417, with most of the codes performed less than 100 times annually. We believe it is fair to say that the six general orthopaedic surgeons surveyed during the Harvard study were not likely familiar and fit to rate these major procedures that are most often referred to musculoskeletal tumor specialists. Subsequent to the Harvard study, 27077 was submitted by MTS and AAOS for review during the second 5-year-review. During this review of physician work, the RUC reviewed all components of work. The RUC agreed that the patient population had become more complex and that the Harvard study did not correctly estimate physician work for these codes. During the current survey process, we find that the intra-operative time and length of stay has increased significantly for 27077. For this reason, we are asking for this code to be reviewed.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for lateral positioning.
- Scrub/Dress/Wait: no change

Hospital Visits: With respect to the hospital visits for 27077, we are recommending 8 total hospital visits, 4 at a level 99231 and 4 at a level of 99232. Our survey respondents indicated one visit would be at a level of 99233. However, the consensus committee felt that 4-99232 was the more appropriate recommendation.

Recommendation: The consensus committee recommends the survey median RVW of 45.00. Along with the recommended time and visit information, this results in an IWPUT of 0.072. This RVW is greater than the reference code 20956 which has less total time and a different pattern of time and visit details.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27077

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

CPT Descriptor: Radical resection of tumor; ischial tuberosity and greater trochanter of femur

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52-year-old female presents with a malignant fibrous histiocytoma of the ischial tuberosity. At operation, a radical resection of the tumor with adjacent soft tissues is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

's moderate sedation inherent to this procedure in the Hospital/ASC setting? No
'ercent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made, ellipsing the biopsy tract in a wide en bloc fashion. The incision is made from the upper buttocks to the upper thigh, incorporating the biopsy tract. The dissection is carried down through the subcutaneous fat maintaining a cuff of tissue surrounding the biopsy tract and tumor. The incision is carried down through the limiting fascia of the buttocks, to the fascia of the gluteus maximus. The fascia is opened and e fibers of the muscles are split in order to gain exposure down to the ischium without having to transect the muscle ellies. Extreme care is required in order to prevent injury to the sciatic nerve. The sciatic nerve must be found and protected from undue tension or retractors. A tape is placed around the nerve and it is gently reflected to one side. The hamstring origin is then approached and transected from the underlying bone. A portion of the muscle origin however must be maintained in continuity with the ischium in order to secure a clear margin around the tumor. An extra-periosteal dissection is then carried proximally along the ischium, towards the pubic rami, both superior and inferior to

the edges of the tumor. Once the affected bone is completely dissected free from surrounding soft tissues, a subperiosteal dissection is performed circumferentially around either end of the bone beyond the area of tumor involvement. A saw is then used to create the osteotomy at least 2 centimeters proximal to the tumor laden ischium, and then another osteotomy is created distal to the tumor. Large amounts of remaining soft tissue are then dissected leav normal tissue with the specimen. By completing the osteotomies, the specimen can be mobilized and ultimately fi from the surrounding tissues. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. The remaining bone edges are rasped to a fine finish. Irrigation is performed. The gluteus maximus is repaired and re-approximated to itself. The fascia is closed over a drain. Subcutaneous tissues and skin are closed in the usual fashion.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff... Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary manageme Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes

had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: Add 20 minutes for extensive additional review of imaging and pathology studies to correctly mark and plan the procedure and consultation with reconstructive surgeon.
- Positioning: Add 17 minutes for prone positioning.
- Scrub/Dress/Wait: no change

Hospital Visits: With respect to the hospital visits for 27078, we are recommending 5 total hospital visits, 2 at a level 99231 and 3 at a level of 99232. Our survey respondents indicated one visit would be at a level of 99233. However, the consensus committee felt that 3-99232 was the more appropriate recommendation.

Recommendation: The consensus committee recommends the survey median RVW of 32.00. Along with the recommended time and visit information, this results in an IWPUT of 0.078. This RVW and IWPUT is similar the reference code 27134, which is also a demanding operation, but has less total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27078

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national, non-medicare, frequency not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

CPT Descriptor: Radical resection of tumor, femur or knee

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 14-year-old female presents with an osteosarcoma of the distal femur. At operation, a radical resection of the tumor with adjacent soft tissues is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made, ellipsing the biopsy tract in a wide en bloc fashion. The incision is made from the upper thigh, incorporating the biopsy tract, extending the incision to approximately 12 cm below the knee. The dissection is carried down through the subcutaneous fat maintaining a cuff of tissue surrounding the biopsy tract and tumor. The incision is carried down through the limiting fascia of the thigh, extending down to the patella and along its side, then to the tibial tubercle. The tumor originated in the distal end of the femur but has an associated soft tissue mass that involves the quadriceps and hamstrings. The dissection therefore proceeds through t' quadriceps, once again, maintaining a cuff of quadriceps muscle on the tumor to maintain a wide margin. The rect. femoris muscle is dissected from the underlying vastus intermedius followed by dissection through a portion of the vastus lateralis and the vastus medialis. The vastus intermedius is maintained around the soft tissue component of the tumor. At the level of the knee, an arthrotomy is made, incising through the joint capsule at the level of the tibia to ensure a cuff of tissue being maintained around the tumor and distal femur. Dissection is carried further towards the

patellar tendon, along its length down to its insertion into the tibia. This allows for the mobilization of the patella. The patella is everted thus exposing the joint. The anterior cruciate ligament is identified and divided. The posterior cruciate ligament is divided followed by subluxation of the knee forwards in order to bring the menisci into view. Both the lateral collateral ligament is identified and divided as well as the medial collateral ligament followed by total meniscectomy of both the medial and lateral menisci. The remaining capsular structures are then transected being very careful of the neurovascular structures (artery, vein, and both tibial and peroneal nerves) which lie intimately in contact with the back of the knee joint. The femur is elevated forwards to allow for exposure of the back of the thigh. The neurovascular structures are identified and carefully dissected one by one off of the overlying femur. The sheath must be opened in order to be able to dissect the vein, nerve and artery in a sub-adventitial fashion from the tumor. The hamstring muscles are carefully divided from the now overlying soft tissue component of the tumor and femur. Each hamstring muscle is individually divided by dissection from the overlying mass. This allows for completion of the dissection of the artery then vein, then both peroneal and tibial components of the sciatic nerve from the remaining muscles and tumor. Care is taken to ligate each feeding vessel into the tumor and femur as it is approached an s the tumor does often have neovascularity. The dissection is carried proximally in this fashion until the level of the proposed osteotomy dictated by the pre-operative planning. At this point, 18 cm. above the knee, the dissection is carried circumferentially around the entire femur. The periosteum is elevated from the femur 2 cm proximal to the proposed cut in the bone to allow for later overlap of the periosteum over the prosthesis. The bone is marked with a saw blade to demonstrate orientation once the prosthesis is inserted. The bone is then cut with a saw and the remaining soft tissues are dissected free from the specimen. The specimen consists of the skin of the biopsy tract, the underlying subcutaneous fat, fascia, muscle, tumor, bone, ligaments, tendons, and capsular structures, all in one piece. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. The surgeon then returns to the operative suite and scrubs in to the operation. The wound bed is inspected, bleeding vessels are taken care of and the neurovascular structures are re-evaluated to ensure they are intact. During the remainder of the procedure, these structures must be protected from stretch, twisting, retraction, etc. as there is now no bone to provide structure of this limb. The fascial layers are closed in a watertight fashion over a large bore drain, followed by closure of the subcutaneous tissues and skin.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff... Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes

had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 4 as follows:

- Evaluation: no change
- Positioning: no change
- Scrub/Dress/Wait: no change

Hospital Visits: With respect to the hospital visits for 27365, we are recommending 75 total hospital visits, 2 at a level 99231 and 3 at a level of 99232. Our survey respondents indicated one visit would be at a level of 99233. However, the consensus committee felt that 3-99232 was the more appropriate recommendation.

Recommendation: The consensus committee recommends the survey median RVW of 32.00. Along with the recommended time and visit information, this results in an IWPUT of 0.081. This RVW is similar to the reference ode 27134 which has very similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotics. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made, ellipsing the biopsy tract in a wide en bloc fashion. The incision is made from the lower thigh, incorporating the biopsy tract, extending the incision to approximately 4 inches above the ankle. The dissection is carried down through the subcutaneous fat maintaining a cuff of tissue surrounding the biopsy tract and tumor. The incision is carried down through the limiting fascia of the leg, extending down to the patella and along its side, then towards the tibial tubercle. The dissection is then carried further down the ; to nearly the ankle. The tumor originated in the proximal end of the tibia but has an associated soft tissue mass that volves the anterior and posterior musculature of the entire leg. The dissection therefore then proceeds through the tibialis anterior, and extensors of the foot and ankle, then laterally through the peroneal muscles, once again, maintaining a cuff of normal tissue on the tumor to maintain wide margins around the tumor. The tibialis anterior, extensors and peroneals are dissected from the underlying musculature overlying the bone itself. All neurovascular structures are meticulously dissected free from the overlying tumor. At the level of the knee, an arthrotomy is made, incising through

he joint capsule at the level of the femur to ensure a cuff of tissue being maintained around the tumor and proximal tibia. Dissection is carried further towards the patellar tendon, along its length up to its origin on the patella. This allows for the mobilization of the patella. The patella tendon is transected from the tibial tubercle. The patella is everted thus exposing the joint. The anterior cruciate ligament is identified and divided. The posterior cruciate ligament is divi followed by subluxation of the knee forwards in order to bring the menisci into view. Both the lateral collateral ligan is identified and divided as well as the medial collateral ligament followed by total meniscectomy of both the medial and lateral menisci. The remaining capsular structures are then transected being very careful of the neurovascular structures (artery, vein, and both tibial and peroneal nerves) which lie intimately in contact with the back of the knee joint. The tibia is elevated forwards to allow for exposure of the back of the leg. The gastrocnemius and soleus muscles are carefully divided from the now overlying soft tissue component of the tumor and tibia. Dissection of the artery then vein, then both peroneal and tibial components of the sciatic nerve from the remaining muscles and tumor is performed. Care is taken to ligate each feeding vessel into the tumor and femur as it is approached as the tumor does often have neovascularity. The dissection is carried distally in this fashion until the level of the proposed osteotomy dictated by the pre-operative planning. At this point, 16 cm. below the knee, the dissection is carried circumferentially around the entire tibia. The periosteum is elevated from the tibia one to two cm. distal from the proposed cut in the bone to allow for later overlap of the periosteum over the prosthesis. The bone is marked with a saw blade to demonstrate orientation for later reconstruction. The bone is then cut with a saw and the remaining soft tissues are dissected free from the specimen. The specimen consists of the skin of the biopsy tract, the underlying subcutaneous fat, fascia, muscle, tumor, bone, ligaments, tendons, and capsular structures, all in one piece, without any contamination of tumor from prior surgery. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. The surgeon then returns to the operative suite and scrubs in to the operation. The wound bed is inspected, bleeding vessels are ligated and the neurovascular structures are re-evaluated to ensure they are intact. During the remainder of the procedure, these structures must be protected fr stretch, twisting, retraction, etc. as there is now no bone to provide structure of this limb. Muscles are mobilized order to provide coverage for the closure. The remaining gastrocnemius, tibials, peroneals, etc. are mobilized by dissecting them free from their fascial boundaries and brought together to provide a good wound bed. Muscles are sutured to each other followed by closure of fascia over a drain, then skin closure.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff... Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic la and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatm plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordinatio telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

INTENSITY/COMPLEXITY MEASURES (Mean)

1ental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.80	3.90
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.80	3.70
Urgency of medical decision making	4.70	3.10

Technical Skill/Physical Effort (Mean)

Technical skill required	4.70	4.30
Physical effort required	4.70	4.30

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.70	4.30
Outcome depends on the skill and judgment of physician	4.90	4.60
Estimated risk of malpractice suit with poor outcome	4.60	4.30

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	5.00	4.20
Intra-Service intensity/complexity	4.90	4.50
Post-Service intensity/complexity	4.70	3.90

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ompelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes

had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 4 as follows:

- Evaluation: no change
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW of 27.00. Along with the recommended time and visit information, this results in an IWPUT of 0.080. This RVW is similar to the reference code 27156 which has very similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27645

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national, non-medicare, frequency not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 59
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2006 Medicare Utilization

Specialty orthopaedic surgery Frequency 53 Percentage 89.83 %

Specialty podiatryu Frequency 3 Percentage 5.08 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

CPT Descriptor: Radical resection of tumor; fibula

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female presents with a malignant fibrous histiocytoma of the fibula. At operation, a radical resection of the tumor with adjacent soft tissues is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 7% , Admitted (more than 24 hours) 93%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made, ellipsing the biopsy tract in a wide en bloc fashion. The incision is made from the distal thigh, incorporating the biopsy tract, extending the incision to approximately 10 cm above the ankle. The dissection is carried down through the subcutaneous fat maintaining a cuff of tissue surrounding the biopsy tract and tumor. The incision is carried down through the limiting fascia of the leg, extending down from the lateral distal thigh to the ankle. The tumor is associated with a large soft tissue mass that involves the anterior a posterior musculature of the leg. The dissection therefore proceeds through the peroneal longus and brevis muscles, a the extensor muscles of the foot and ankle, once again, maintaining a cuff of normal muscle on the tumor to affect a wide margin. The muscle bellies are dissected from the underlying musculature overlying the bone itself. All neurovascular structures are meticulously dissected free from the overlying tumor. At the level of the knee, an arthrotomy is made, through the capsule of the tibio-fibular joint in order to mobilize the fibula. Care is necessary, as

the anterior tibial vessels course directly in the path and must be dissected free and preserved. The lateral collateral ligament must be divided for resection of the fibula... The gastrocnemius and soleus muscles are carefully divided from the overlying soft tissue component of the tumor and tibia. Dissection of the popliteal artery, vein and tibial and peroneal nerves from the remaining muscles and tumor is performed. Care is taken to ligate each feeding vessel into the tumor. The dissection is carried distally in this fashion until the level of the proposed osteotomy dictated by the pre-operative planning. At this point, 18 cm. below the knee, the dissection is carried circumferentially around the entire fibula... The bone is then cut with a saw and the remaining soft tissues are dissected free from the specimen. The specimen consists of the skin of the biopsy tract, the underlying subcutaneous fat, fascia, muscle, tumor, bone, ligaments, tendons, and capsular structures, all in one piece. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. The surgeon then returns to the operative suite and scrubs in to the operation. The wound bed is inspected, bleeding vessels are taken care of and the neurovascular structures are re-evaluated to ensure they are intact. During the remainder of the procedure, these structures must be protected from stretch, twisting, retraction, etc. as there is now no bone to provide structure of this limb and the nerve could inadvertently be stretched. The fascial layers are closed in a watertight fashion over a drain, followed by closure of the subcutaneous tissues and skin.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff... Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examine and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes

had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for lateral positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW of 23.00. Along with the recommended time and visit information, this results in an IWPUT of 0.067. This RVW is similar to the reference code 27447 which has very similar total work and similar post-operative time, although the IWPUT for 27646 is less than that of 27447 (.099). The intra-service times between 27447 and 27646 are quite distinct, however the survey intra-service time for 27646 is consistent with the intra-service times for other radical bone tumor codes that were surveyed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27646

Global Period: 090 RUC Recommended RVU: **20.10**

CPT Descriptor: Radical resection of tumor; talus or calcaneus

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 14-year-old female presents with a Ewing's sarcoma of the calcaneus. At operation, a radical resection of the calcaneus is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 10% , Admitted (more than 24 hours) 90%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 67%

's moderate sedation inherent to this procedure in the Hospital/ASC setting? No
ercent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A longitudinal incision is made, ellipsing the biopsy tract in a wide en bloc fashion. The incision is made from the distal leg, incorporating the biopsy tract, extending the incision to the mid foot in a hockey stick configuration. The dissection is carried down through the subcutaneous fat maintaining a cuff of tissue surrounding the biopsy tract and tumor. The incision is carried down through the limiting fascia of the foot and ankle, tending down from the distal leg to the midfoot. The tumor is associated with a soft tissue mass that involves the edial and lateral compartments at the ankle. The dissection therefore proceeds and flaps are created to allow for later reconstruction. Due to the soft tissue component of the tumor, this requires intra-operative modification of flaps in order to ensure that the wound will be able to be closed and that the skin flaps will survive. A cuff of normal muscle is maintained on the tumor to insure a wide margin. The muscle bellies are dissected from the underlying musculature. All neurovascular structures are meticulously dissected free from the overlying tumor. At the level of the articular

surface, an arthrotomy is made, through the capsule of the ankle joint in order to mobilize the calcaneus. Care is necessary, as the dorsal vessels course directly in the path and must be dissected free and preserved. The collateral ligament must be divided for resection of the bone. Care is taken to ligate each feeding vessel into the tumor. The dissection is carried distally in this fashion until the level of t`he proposed resection dictated by the pre-opera' planning. At this point, typically, the dissection is carried circumferentially around the entire bone. The remaining tissues are dissected free from the specimen. The specimen consists of the skin of the biopsy tract, the underlying subcutaneous fat, fascia, muscle, tumor, bone, ligaments, tendons, and capsular structures, all in one piece, without any contamination from tumor from prior surgery. The specimen is then removed from the field and marked for anatomic orientation. This is documented on the pathology request form along with appropriate history and needed information. The surgeon then breaks scrub and carries the specimen to the pathology department while the anesthesiologist and other operative personnel remain with the patient. Prior to this, the surgeon assesses the stability of the operative field and discusses with the anesthesiologist the stability of the patient. In the pathology department, the surgeon then examines the resected specimen with the attending pathologist and orients the pathologist to the specimen anatomy. The specimen is then inked for margins and any areas that are questionable are inspected by frozen section. The surgeon then returns to the operative suite and scrubs in to the operation. The wound bed is inspected, bleeding vessels are taken care of and the neurovascular structures are re-evaluated to ensure they are intact. During the remainder of the procedure, these structures must be protected from stretch, twisting, retraction, etc. as there is now no bone to provide structure of this limb and the nerve could inadvertently be stretched. The remaining muscles are rotated to fill in the void left by the resection. All muscle flaps are sutured in place to ensure that the prosthesis is completely covered... The fascial layers are closed in a watertight fashion followed by closure of the subcutaneous tissues and skin.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff... Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Order and review imaging as necessary. Consider relevant data, options, and risks a revise treatment plan as necessary. On subsequent days, review medical records and interval data charted. Examin and talk with patient. Take down dressings, assess wound and patient status. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for continued anticoagulation and pain medication as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all

of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: Add 10 minutes for extensive additional review of imaging and pathology studies to correctly mark and plan the procedure and consultation with reconstructive surgeon.
- Positioning: Add 17 minutes for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW of 20.10. Along with the recommended time and visit information, this results in an IWPUT of 0.071. This RVW is similar to the reference code 27580 which has very similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology regarding margins. Communicate with vascular and/or plastic surgeon regarding operative plan and future reconstruction. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A 6 cm incision is made over the lateral aspect of the foot over the distal calcaneus and cuboid bones. Subcutaneous flaps are raised. The deep fascia is split and the cuboid and its soft tissue mass are exposed. The calcaneocuboid joint is exposed. The cuboid – metatarsal joints are exposed. The peroneal tendons are retracted out of the way. The distal sural nerve is protected. Wide resection of the tumor is performed around the m to the navicular bone medially. Surrounding tissue is sent for margins along with the tumor to pathology for froz section. The pathology report is received and additional tissue is removed as necessary. The wound is inspected and irrigated. The tourniquet is deflated and hemostasis is obtained. A deep drain is placed. The deep tissue is closed with interrupted sutures. The superficial wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status... Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management reconstruction. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Intra-Service intensity/complexity	4.29	4.29
Post-Service intensity/complexity	4.00	3.57

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes

had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: Add 10 minutes for extensive additional review of imaging and pathology studies to correctly mark and plan the procedure and consultation with reconstructive surgeon.
- Positioning: Add 17 minutes for lateral positioning.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey 25th percentile RVW of 16.25. Along with the recommended time and visit information, this results in an IWPUT of 0.077. This RVW is less than the reference code 27580 which has more intra-operative time and post work, but similar intensity.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28171

CPT Code:28173 Tracking Number P91 Specialty Society Recommended RVU: **14.00**

Global Period: 090 RUC Recommended RVU: **14.00**

CPT Descriptor: Radical resection of tumor; metatarsal

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old woman presents with a chondrosarcoma of her first metatarsal with a small soft tissue mass. A radical resection of the first metatarsal and the mass is performed with preservation of the great toe.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 3% , Kept overnight (less than 24 hours) 60% , Admitted (more than 24 hours) 33%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 61%

's moderate sedation inherent to this procedure in the Hospital/ASC setting? No
ercent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Verify that all required instruments and supplies are available. Assist with patient supine positioning and padding to stabilize foot. Perform regional block. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A seven cm incision is made excising the previous biopsy tract to keep it with the specimen. Subcutaneous flaps are raised. The sensory nerves are retracted carefully. The extensor tendons are retracted and carefully protected. The metatarsal -navicular joint is identified and isolated. The metatarsal- phalangeal joint is isolated and protected. A wide dissection is carried around the metatarsal with the chondrosarcoma. The plantar neurovascular bundles are identified and retracted. The plantar flexor tendons are retracted. The tumor is removed through the two joints including the joint capsules. Surrounding tissue is sent for frozen section along with the tumor to pathology. Any additional resection will be performed pending the report of the frozen sections results. The wound is then inspected and irrigated. A deep drain is placed. The tourniquet is let down and hemostasis is achieved. Deep 'osure is performed with interrupted sutures. Superficial closure is performed with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review

medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing open wound status and drain. Assess neurovascular status... Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professio including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for antibiotic and pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management reconstruction. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all

of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: no change
- Positioning: Add 2 minutes. Patient's leg is elevated and foot is stabilized. Opposite extremity is padded. Tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring for compartment syndrome. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey 25th percentile RVW of 14.00. Along with the recommended time and visit information, this results in an IWPUT of 0.071. This RVW is similar to the reference code 28715 which has more intra-operative time but is less intense and complex.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. The patient is in the supine positioning and padded to stabilize foot. Perform regional block. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A 5 cm incision is made over the dorsomedial proximal phalanx of the great toe. Subcutaneous flaps are raised and the deep tissue is exposed. The extensor tendons are retracted laterally. The metatarsal-phalangeal joint is exposed and protected. The interphalangeal joint is exposed and protected. The neurovascular bundle is identified and protected. The deep flexor tendons are mobilized and protected. Careful dissection is carried around the tumor and it is removed en bloc. Frozen section margins are taken from the surrounding tissue. The pathology report is received and any additional tissue is removed as necessary. Inspection and irrigation of the wound is performed. The tourniquet is let down and hemostasis is obtained. Deep closure is performed with interrupted sutures. Superficial closure is performed with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Ta. specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete

medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office several times through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management for reconstruction and further chemo/radiation therapy. Discuss progress with oncologist and PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence

The MTS and the AAOS presented the malignant bone tumor codes as misvalued to CMS and the RUC during the last 5-year-review. Although these codes were a subset of all of the tumor codes presented by MTS, and they are only performed by orthopaedic surgeons (and podiatry for some of the foot/toe codes), they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. Subsequent to that decision, the bone tumor codes

had minor revisions made to their descriptors. The same compelling evidence arguments still apply to the review of these codes – a change in patient population, a change in technology, and the fact that the surgeons who most often perform these rarely performed procedures were not part of the Harvard study, which significantly underestimated the work to resect these bone tumors and care for these patients with bone cancer.

Over the past ten years, significant advancement has been made in the treatment of bone tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and (more importantly) functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: no change
- Positioning: Add 5 minutes for patient positioning supine, with foot elevated and stabilized with padding (including padding the opposite leg), and application of a tourniquet.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW of 8.13. Along with the recommended time and visit information, this results in an IWPUT of 0.059. This RVW is less than the reference code 29891 which has similar time and visits, but is more complex and intense intra-operatively and thus has a higher IWPUT (.069) and a commiserate higher RVW of 9.47.

ERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

REQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28175

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national, non-medicare, frequency not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 269
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2006 Medicare Utilization

Specialty orthopaedic surgery Frequency 13 Percentage 4.83 %

Specialty podiatry Frequency 247 Percentage 91.82 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Subject: RUC Work Value Recommendations for Bone Tumor Codes

Introduction

On behalf of the Musculoskeletal Tumor Society (MSTS), American Academy of Orthopaedic Surgeons (AAOS), American Society for Surgery of the Hand (ASSH), American Orthopaedic Foot and Ankle Society (AOFAS), and the American Podiatric Medical Association (APMA) are pleased to provide (after 14 years of on-going work) physician work RVU recommendations for excision of bone tumor codes as identified in the RUC agenda for Jan/Feb 2009 Tab 8:

P57-26262	P90-28171	P82-27646	P74-27365
P92-28175	P41-24152	P40-24150	P67-27078
P56-26260	P83-27647	P81-27645	P64-27075
P91-28173	P48-25170	P32-23210	P65-27076
P55-26250	P31-23200	P33-23220	P66-27077

In 1993, eight codes for resection of bone tumors were brought to CPT for editorial changes (27075, 27365, 27645, 27646, 27647, 28171, 28173, and 28175). These were part of the extensive revision to the musculoskeletal section of CPT. No RUC surveys were conducted.

Of the 20 malignant bone tumor codes, only one code was surveyed during the Harvard study for all components (pre, intra, and post), and the survey consisted of only six general orthopaedic surgeons. The other 19 codes were only surveyed for intra-operative time/work, with pre and post-service work predicted by algorithm. The current Medicare frequency for these codes ranges from a low of four to a high of 417, with most of the codes performed less than 100 times annually. We believe it is fair to say that the six general orthopaedic surgeons surveyed during the Harvard study were not likely familiar and fit to rate these major procedures that are most often referred to musculoskeletal tumor specialists.

In 1994, the AAOS responded to CMS's first 5-year review request for comment on misvalued codes with a letter that included approximately 1,300 codes. Because a significant portion of the musculoskeletal section of CPT were in an extensive revision process at the same time the Harvard Study results were being sent to CMS for the first physician fee schedule, codes were incorrectly crosswalked and anomalies were created. The comment letter included the results of an Abt study, similar to the Harvard study methodology. The AAOS presented this study to the AMA/RUC Research Subcommittee and it was rejected. The AAOS was allowed to withdraw the original comment and submit a modest list of 83 codes believed to be "most" misvalued for survey and review during the first 5-year review.

Two of the 83 codes were for radical resection of bone tumors (27076 and 27365). The RUC agreed that the patient population had become more complex and that the Harvard study did not correctly estimate the intra-operative work. Total work, intra-operative intensity, and levels of hospital and office visits were not considered. New work values were calculated by adding an additional RVU increment to account for the different in intra-operative time between the Harvard study and the RUC survey. The calculated work RVU's resulted in an IWPUT of 0.022 for both codes. If the level of hospital visits are considered and corrected, a

negative IWPUT results. The current survey provides time and visit data from surgeons familiar with these procedures. Intra-operative time for both codes is significantly greater than recorded in 1995. For this reason, we are asking for these codes to be reviewed at this time for all survey components (pre, intra, post)

Two additional codes were submitted by the MSTS and the AAOS for review during the second 5-year-review (27075 and 27077). During this review of physician work, the RUC reviewed all components of work. The RUC agreed that the patient population had become more complex and that the Harvard study did not correctly estimate physician work for these codes. During the current survey process, we find that the intra-operative time and length of stay has decreased slightly for 27075 and has increased slightly for 27077. For this reason, we are asking for these codes to be reviewed, as we are recommending that the work RVUs for 27075 be decreased slightly and the work RVUs for 27077 be increased slightly.

Significant advancement in imaging has allowed for much more precise understanding of anatomic location and extent of tissue involvement. For malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This has enhanced our ability to kill tumors in situ at a higher level. While 20 years ago amputation was used most commonly, limb preservation resections have now become the rule with amputation being used in less than 5% of patients with pelvic and extremity sarcomas. As such, whereas in the past only small lesions were amenable to resection, now very large tumors are resected thereby sparing these patients the disfigurement and functional issues associated with amputation. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk.

The Musculoskeletal Tumor Society and the AAOS have presented bone tumor codes to CMS and the RUC during at least one of three 5-year-reviews. The most recent 5-year-review outcome was to send the issue to CPT for coding changes before reviewing work changes.

Methodology

The MSTS and the AAOS, along with the ASSH, AOFAS, and APMA conducted a full RUC survey for each of the 20 bone tumor codes, with varying involvement. Surveying specialties for each code are shown the SoRs. Multiple conference calls before, during and after the survey process were held to be certain everyone was involved. We attempted to identify surgeons familiar with the procedures to survey and except for some of the very low volume codes, a minimum of 30 survey responses was obtained and almost all respondents had experience for the codes they were reviewing.

In developing our recommendations for pre-service time, we utilized the pre-time packages. For some codes, we also added time in a standardized fashion for positioning beyond supine (eg, prone, lateral, beach chair). For each code, a description of pre-time changes (additions and subtractions) is presented in the rationale section.

Frequency and Impact

None of the 20 codes had a change in CPT code numbering. The Medicare frequency is not expected to be different based on CPT nomenclature changes.

One recommendation is less than the current RVW. The Medicare impact for the bone tumor code recommendations would be a net increase of approximately $500,000.

Summary

Although these codes were a subset of all of the codes presented by the MSTS at the last 5-year-review, they were put on hold until all of the soft tissue and bone tumor codes could be reviewed at CPT. For these reasons,

and the compelling evidence arguments discussed above, we request that the RUC agree to review all of these bone tumor codes under the 5-year-review of physician work rules.

CPT Long Descriptor:

P31	23200	Radical resection of tumor; clavicle
P32	23210	Radical resection of tumor; scapula
P33	23220	Radical resection of tumor, proximal humerus
P40	24150	Radical resection of tumor, shaft or distal humerus
P41	24152	Radical resection of tumor, radial head or neck
P48	25170	Radical resection of tumor, radius or ulna
P55	26250	Radical resection of tumor, metacarpal
P56	26260	Radical resection of tumor, proximal or middle phalanx of finger
P57	26262	Radical resection of tumor, distal phalanx of finger
P64	27075	Radical resection of tumor; wing of ilium, one pubic or ischial ramus or symphysis pubis
P65	27076	Radical resection of tumor; ilium, including acetabulum, both pubic rami, or ischium and acetabulum
P66	27077	Radical resection of tumor; innominate bone, total
67	27078	Radical resection of tumor; ischial tuberosity and greater trochanter of femur
P74	27365	Radical resection of tumor, femur or knee
P81	27645	Radical resection of tumor; tibia
P82	27646	Radical resection of tumor; fibula
P83	27647	Radical resection of tumor; talus or calcaneus
P90	28171	Radical resection of tumor; tarsal (except talus or calcaneus)
P91	28173	Radical resection of tumor; metatarsal
P92	28175	Radical resection of tumor; phalanx of toe

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus committee of orthopaedic surgeons, foot and ankle orthopaedic surgeons, and podiatrists representing all types of practices and all geographic settings discussed the practice expense details for the new codes shown above. The consensus was that none of these procedures are emergent.

CPT Code: See Below
Specialty Society('s) AAOS, ACS, AOFAS, APMA, ASPS, AAOHNS

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The clinical staff completes pre-service diagnostic and referral forms. They call the hospital to schedule space and equipment needed in the facility and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. Clinical staff will provide and review educational materials and information prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carrier out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure.

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities
Discharge management (standard 6 minutes for same day or 12 minutes for overnight/admit) and standard office visit related activities are performed.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from the Five Year Review

April 2009

Arteriovenous Shunt Imaging

The RUC identified 36145, *Introduction of needle or intracatheter; arteriovenous shunt created for dialysis (cannula, fistula, or graft)* and 75790, *Angiography, arteriovenous shunt (eg, dialysis patient), radiological supervision and interpretation* through the Five Year Review Identification Workgroup's Codes Reported Together screen as they are reported together more than 95% of the time and referred to CPT for creation of a new bundled service. At its November 2008 meeting, the CPT Editorial Panel created three new codes to describe the work previously reported in 36145 and 75790. The Panel created: 36147, *Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report (includes access of shunt, injection(s) of contrast, and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava)* to describe the combined service; 36148, *additional access for therapeutic intervention (List separately in addition to code for primary procedure)*, an add-on service to describe instances where the practitioner requires additional access to the arteriovenous shunt; and 75791, *Angiography, arteriovenous shunt (dialysis fistula/graft), complete evaluation of dialysis access, including fluoroscopy, image documentation and report (includes injections of contrast and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava), radiological supervision and interpretation*, which describes the work previously reported with either 36147 or 75790.

1322

36147

The specialty society presented the results of a survey of 68 vascular surgeons and interventional radiologists. Survey respondents indicated a median intra-service time of 45 minutes, which the specialty society expert panel and the RUC agreed was appropriate. In consideration of the physician time, the RUC noted that the total time of 36145 plus 75790 is 57 minutes (23 minutes and 34 minutes), though these services have never been RUC reviewed. The specialty noted that the typical patient has changed from a patient with a graft to a patient with a fistula. Fistulas are inherently more difficult to manage. Survey respondents also indicated that moderate sedation is inherent, as it is performed 73% of the time. The survey respondents indicated a median work RVU of 4.70, which the specialty expert panel noted was evidence that the typical patient had changed and is now more difficult. However, the specialty expert panel did not agree that this was an appropriate valuation of the work, nor did they feel the survey 25th percentile work RVU was appropriate. Rather, the specialty recommended and the RUC agreed that the appropriate work RVU for 36147 is 3.72 RVUs. To

calculate this value, the RUC reviewed the survey key reference service, 36558, *Insertion of tunneled centrally inserted central venous catheter, without subcutaneous port or pump; age 5 years or older* (work RVU = 4.81, intra-service time = 30 minutes) and subtracted the value of the post-operative hospital visits within its global period. The visits include one 99212 (0.45) and one-half 99238 (0.64). 4.81 – 1.09 = 3.72. The RUC also noted that the current values of 36145 and 75790 are 2.01 and 1.84 (2.01 + 1.84 = 3.85), respectively and the correct value of 36147 should be slightly lower to account for any efficiencies by performing the procedures together. The RUC also compared the surveyed service to 36145, *Mechanical removal of pericatheter obstructive material (eg, fibrin sheath) from central venous device via separate venous access* (work RVU = 3.59, intra-service time = 45 minutes) and agreed that the two services are comparable, though 36147 is requires greater intensity, accounting for a slightly higher work RVU. **Therefore, the RUC recommends the new physician time as surveyed and a work RVU of 3.72 for CPT code 36147.**

36148

The specialty society presented the results of a survey of 45 vascular surgeons and interventional radiologists. The societies involved convened an expert panel as the surveyees indicated physician time which included pre and post service work for this add-on service, selected a key reference code 36558, *Insertion of tunneled centrally inserted central venous catheter, without subcutaneous port or pump; age 5 years or older* (work RVU = 4.81), and indicated a median work RVU of 4.13 for 36148. Survey respondents also indicated that moderate sedation is inherent, as it is performed 74% of the time. The expert panel did not agree that the survey results appropriately reflected the time or work required to perform this procedure. The expert panel instead derived a work value of 1.00 for 36148 by dividing the existing work value of 36145, *Introduction of needle or intracatheter; arteriovenous shunt created for dialysis (cannula, fistula, or graft)* (work RVU = 2.01) by two. Currently, when an additional access is required, a physician will report an additional 36145, subject to a modifier 51 reduction of 50%. The new add-on code describes the same intra-service work originally reported by 36145, which was subjected to the 50% reduction. As such, the expert panel and the RUC agreed that one-half the current value is appropriate (2.01 / 2 = 1.00). The RUC also reviewed another reference service, 36620, *Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous),* (work RVU = 1.15, 7 minutes pre, 10 minutes intra, and 5 minutes post-service time). Though the specialty society agreed that the work of cannulating a poorly functioning dialysis graft or fistula is more difficult than placement of a routine arterial line, the RUC agreed that 36620 represents the most reasonable comparison. The specialties' expert panel posits that respondents may not have understood the complexities of add-on codes and modifier -51 exempt codes, which skewed the physician time and work values. The panel recommended and the RUC agreed that 15 minutes of intra-service time best reflects the time involved for 36148. **Therefore, the RUC recommends a work RVU of 1.00 and an intra-service time of 15 minutes with no pre and post service times for CPT code 36148.**

75791

The specialty society presented the results of a survey of 45 vascular surgeons and interventional radiologists. The survey respondents indicated a median intra-service time of 30 minutes. However, the specialties' expert panel agreed that this was slightly higher than required. The work involved in 75791 represents a very rare scenario. For a 75791, a patient is sent to the physician once dialysis has begun, but the fistula or graft is not functioning properly. The dialysis needle is still in place and the imaging is conducted through that access point. The specialty commented that the overestimation of the intra-service time may also be due to the mix of specialties completing the survey. As such, the specialty recalculated the survey results between interventional radiologists and vascular surgeons based on utilization and revised their recommendations to a the median intra-service time of 25 minutes and the median work RVU of 1.71. To substantiate this recommendation, the RUC noted that the work of 75791 is very similar to that of 75790, though the intra-service time is slightly lower than the existing physician time of 34 minutes. Moreover, the existing physician work RVU of 75790 is slightly higher than the recommended work RVU, 1.84 versus 1.71, respectively. **Therefore, the RUC recommends a work RVU of 1.71 and an intra-service time of 25 minutes, with 15 minutes pre-service evaluation and 15 minutes immediate post-service time for CPT code 75791.**

1324

Work Neutrality

The specialty society provided data to the RUC showing that the new coding structure will account for an overall decrease in work relative values for this family of services to be redistributed in the Medicare conversion factor. Currently, 36145 and 75790 are reported together approximately 95% of the time accounting for roughly 250,000 combined reporting. The specialty society estimates that 36147 will be reported approximately 188,000 times and 36148 will be reported 62,000 times. 75791 will only be reported on rare occasions (i.e., less than 1,000 per year).

Practice Expense

The RUC agreed that moderate sedation is inherent in 36147 and 36148. The supplies, equipment and clinical staff time were edited to reflect that moderate sedation is inherent.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
D 36145		~~Introduction of needele or intracatheter; arteriovenous shunt created for dialysis (cannula, fistula, or graft)~~ *(For insertion of arteriovenous cannula, see 36810-36821)* (36145 has been deleted. To report see 36147, 36148)	XXX	N/A
Ø•36147	W1	Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); initial acess, with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report (includes access of shunt, injection(s) of contrast, and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava) (If 36147 indicates the need for a therapeutic intervention requiring a second catheterization of the shunt, use 36148) (Do not report 36147 with 75791)	XXX	3.72

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36147 Tracking Number W1 Specialty Society Recommended RVU: **3.72**

Global Period: XXX RUC Recommended RVU: **3.72**

CPT Descriptor: Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report (includes access of shunt, injection(s) of contrast, and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old man with ESRD is referred for evaluation because of increased difficulty puncturing the AV shunt for dialysis. He has been on hemodialysis for 5 years, and this is his second AV shunt. He has an AV fistula in the left upper arm, and was most recently studied 10 months ago, at which time a 2cm stenosis of the arteriovenous anastomosis and immediate outflow was found and treated with balloon angioplasty.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 81%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 73%

Is moderate sedation inherent in your reference code (Office setting)? Yes
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? Yes

Description of Pre-Service Work:
-Discuss procedure details, including alternatives and risks with the patient and family and informed consent is reviewed
-Estimate the range of devices that may be required and ensure all are available for use
-Ensure all technical personnel have been familiarized with the procedure and are fully familiar with all required devices
-Check the interventional suite to ensure proper function and configuration of the imaging equipment including compliance with all radiation safty issues
-Re-review applicable, available prior films
-Don radiation protection device

Description of Intra-Service Work:
- Position (or supervise) proper positioning of patient
- IV set up is checked and moderate sedation administered
- Local anesthesia is applied to the entry site and the arterivenous shunt is punctured and sheath placed

- Angiography is performed to include the entire length of the graft and all outflow veins to the level of the superior vena cava. Compression may be applied to allow visualization of the arterial anastamosis
- Technical personel are directed throughout
- Interpretation of the imaging of all views obtained
  Sheath and any neccesary catheters and wires are removed from the body
- Hemostasis is obtained by direct compression
- Review and interpret all images
- Dictate a report for the medical record

Description of Post-Service Work:
- Make a note in the patient record
- Discuss the outcome of the procedure with the patient and family and instructions are given
- Review, revise and sign final report

Post-Service intensity/complexity	3.00	2.40

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACR, SIR, and SVS convened a panel that included a number of physicians familiar with this service to review the RUC survey data. The reference code selected most commonly was code 36558 with work value of 4.81. The median survey data for 36XX1 shows work value of 4.70 with 20 min pre, 45 min intra, and 15 min post.

The societies are recommending a work value of 3.85 (which falls just below the 25th percentile) and median physician time of 20 min pre, 45 min intra, and 15 min post. Code 36147 was previously coded using codes 36145 (Introduction f needle or intracatheter; arteriovenous shunt created for dialysis) with work value of 2.01 and 75790 (Angiography, arteriovenous shunt (eg, dialysis patient), radiological supervision and interpretation) with work value of 1.84. The panel believes that the sum of 2.01 and 1.84 best reflects the work involved with code 36XX1. Moreover, the total time of the codes 36145 / 75790 equal 57 minutes, which compares favorably to the 80 minutes of median physician time of our surveys. CMS required us to survey 36147 as an XXX code, which makes it somewhat difficult to allocate respondents' time. When compared to the reference service, the panel recognizes that 36558 has 1.09 RVU post-operative care in the global period making the comparable value for 36558 3.72 RVU; however, survey respondents rated the intensity and complexity of 36147 greater than 36558, for all 11 measures, which, combined with our recommendation for a lower RVU as compared to the median RVU, is believed to account for the difference in RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36145, 75790

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty Interventional Radiology
How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 1436454

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services for 36145 and 75790 in a one year period is estimated to be 1436454 (765384 for 36145 and 671070 for 75790).

Specialty Radiology Frequency 649421 Percentage 45.21 %

Specialty Interventional Radiology Frequency 160596 Percentage 11.18 %

Specialty Vascular Surgery Frequency 149391 Percentage 10.39 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 478,818 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2007 Medicare data estimates that codes 36145 and 75790 were billed approximately 478818 (255128 for 36145 and 223690 for 75790).

Specialty Radiology Frequency 216519 Percentage 45.21 %

Specialty Interventional Radiology Frequency 53556 Percentage 11.18 %

Specialty Vascular Surgery Frequency 49816 Percentage 10.40 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 19103. Physician work involved for 36XX1 is more comparable to code 19103.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 36148 Tracking Number W2 Specialty Society Recommended RVU: **1.00**

Global Period: ZZZ RUC Recommended RVU: **1.00**

CPT Descriptor: Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); additional access for therapeutic intervention (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with ESRD is referred for study of a dialysis access (either graft or fistula) that is not performing well. The patient is seen in an angiographic laboratory. The AV shunt is punctured under local anesthesia and a diagnostic study of the AV shunt is performed (coded as 36XX1). The diagnostic study demonstrates a significant stenosis just below the puncture site that requires balloon angioplasty. A second puncture is required to reach the lesion.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 82%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 74%

Is moderate sedation inherent in your reference code (Office setting)? Yes
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? Yes

Description of Pre-Service Work:

Description of Intra-Service Work:
- Local anesthesia is applied to the second entry site and the arterivenous shunt is punctured and sheath placed
Moderate sedation is monitored
- Required interventions are performed (reported separately)
- Sheath and any neccesary catheters and wires are removed from the body
Hemostasis is obtained by direct compression
Dictate a report for the medical record

Description of Post-Service Work:

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Valu Recommendations for the appropriate formula and format.*

ACR, SIR, and SVS convened a panel that included a number of physicians familiar with this service to review the RUC survey data. The reference code selected most commonly was code 36558 with work value of 4.81. Although the

survey median work value is 4.13, the panel recommends a work value of 1.00 as code 36148 was previously coded using code 36145 with a work value of 2.01 subject to modifier -51. A value of 1.00 maintains the current work value.

Another example is 36620 (Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate rocedure); percutaneous), which is modifier -51 exempt. It has a work value of 1.15 RVU with 7 minutes pre, 10 minutes intra, and 5 minutes post. While we believe the work of cannulating a poorly functioning dialysis graft is more difficult than placement of a routine arterial line, we believe that this code represents a reasonable comparison since as a ZZZ code, 36148 is also modifier -51 exempt. Since the respondents may not have understood the complexities of add on codes and modifier -51 exempt codes, we believe that 15 minutes of intra-service time best reflects the time involved for 36148. Therefore, the panel recommends a work RVU of 1.00 and an intra-service time of 15 minutes with no pre and post service times.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75791 Tracking Number W3 Specialty Society Recommended RVU: **1.71**

Global Period: XXX RUC Recommended RVU: **1.71**

CPT Descriptor: Angiography, arteriovenous shunt (eg, dialysis patient fistula/graft), complete evaluation of dialysis access, including fluoroscopy, image documentation and report (includes injection(s) of contrast and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava), radiological supervision and interpretation

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with ESRD is found to have poor flows during dialysis, with clotting of the needle, such that dialysis cannot be completed. The patient is sent to the angiographic suite with needles in place for a diagnostic study to evaluate the AV shunt.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 71%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 55%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:
-Ensure all technical personnel have been familiarized with the procedure and are fully familiar with all required devices
-Re-review applicable, available prior films
-Check the interventional suite to ensure proper function and configuration of the imaging equipment including compliance with all radiation safty issues
-Re-review applicable, available prior films
- Don radiation protection device

Description of Intra-Service Work:
Angiography is performed to include the entire length of the graft and all outflow veins to the level of the superior vena cava. Compression may be applied to allow visualization of the arterial anastamosis
- Technical personel are directed throughout
- Interpretation of the imaging of all views obtained
- Review and interpret all images

- Dictate a report for the medical record

Description of Post-Service Work:
- Make a note in the patient record
- Discusse the outcome of the procedure with the patient and family and instructions are given
- Review, revise and sign final report

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
49424	000	0.76	**RUC Time**

CPT Descriptor Contrast injection for assessment of abscess or cyst via previously placed drainage catheter or tube (separate procedure)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
93312	XXX	2.20	**RUC Time**	211,899

CPT Descriptor 1 Echocardiography, transesophageal, real-time with image documentation (2D) (with or without M-mode recording); including probe placement, image acquisition, interpretation and report

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 7 **% of respondents:** 22.5 %

TIME ESTIMATES (Median)

	CPT Code: 75791	**Key Reference CPT Code: 49424**	**Source of Time**
Median Pre-Service Time	15.00	12.00	**RUC Time**
Median Intra-Service Time	25.00	15.00	
Median Immediate Post-service Time	15.00	10.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**55.00**	**37.00**	

Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	2.86	2.14
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.43	2.29
Urgency of medical decision making	2.29	2.14

Technical Skill/Physical Effort (Mean)

Technical skill required	2.14	1.86
Physical effort required	1.86	1.86

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.00	1.86
Outcome depends on the skill and judgment of physician	2.43	2.00
stimated risk of malpractice suit with poor outcome	2.14	1.86

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.14	1.71
Intra-Service intensity/complexity	2.43	1.71
Post-Service intensity/complexity	1.86	1.86

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an RVPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACR, SIR, and SVS convened a panel that included a number of physicians familiar with this service to review the RUC survey data. The reference code selected most commonly was code 49424 with work value of 0.76. The panel recommends median work value of 1.84 with the median percentile physician time of 15 min pre, 30 min intra, and 15

min post. Our experts acknowledge that 75791 is more complex than the reference code. This is due to the increased complexity and variability of the vasculature compared to assessing healing of an abscess cavity. 75791 requires a greater number of views, patient positions and graft compression to visualize the length the fistula, arterial inflow and venous outflow.

Additionally 75791 can be considered the sum of 75820 (Venography, extremity, unilateral, radiological supervision and interpretation) 0.7 RVU + 75827 (Venography, caval, superior, with serialography, radiological supervision and interpretation) 1.14 RVU, which is our median value of 1.84 RVU. While the codes are not RUC valued, the Harvard times of 14 min for 75820 plus 22 min for 75827 (total 36 min) compare favorably with the survey times for 75791.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75790

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty Interventional Radiology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 296496
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. The overall number of services for 75790 in a one year period is estimate to be 296496.

Specialty Radiology Frequency 13099 Percentage 4.41 %

Specialty Interventional Radiology Frequency 31754 Percentage 10.70 %

Specialty Vascular Surgery Frequency 32229 Percentage 10.86 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 23,690 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare data estimates that code 75790 was billed approximately 98,832 times.

Specialty Radiology Frequency 98832 Percentage 44.18 %

Specialty Interventional Radiology Frequency 23968 Percentage 10.71 %

Specialty Vascular Surgery Frequency 24331 Percentage 10.87 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 75662

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic & referral forms
- Coordinate pre-surgery services
- Follow-up phone calls & prescriptions
- Retrieve prior appropriate imaging exams and hang for MD review, verify orders, review the chart to incorporate relevant clinical information and confirm contrast protocol with interpreting MD

Intra-Service Clinical Labor Activities:

- Review charts
- Greet patient and provide gowning
- Obtain vital signs
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position the patient/monitor patient/set up IV
- Sedate/apply anesthesia
- Monitor the patient during the procedure
- Assist MD in the procedure
- Assist MD in fluoroscopy and acquisition of imaging data
- Monitor pt. after service: check tubes, monitors, puncture sites
- Clean room/equipment by physician staff
- Check dressings and wound/home care instructions/coordinate office visits/prescriptions
- Pre-procedure Doppler check in addition to initial vitals
- Post procedure Doppler check in addition to initial vitals
- Post procedure film development and hanging of films

Post-Service Clinical Labor Activities:

- Conduct phone calls/ call in prescription

Please see corresponding PERC spreadsheet for additional detail.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from the Five Year Review

April 2009

Perforator Vein Ligation

CPT code 37760 *Ligation of perforator veins, subfascial, radical (Linton type), with or without skin graft, open* was identified by the Five Year Review Identification Workgroup as potentially misvalued through its site of service anomaly screen in September 2007. The specialty societies agreed that this code was inappropriately being used to report a less extensive perforating vein operation stems therefore, the specialty society requested and the RUC agreed that the service be referred to CPT to clarify the descriptor of the existing code and create a new code to report a less extensive perforator vein ligation. To address this concern the CPT Editorial Panel editorially revised 37760 and established a new code to report 37761 which is a subfascial ligation of the perforator vein through a direct open surgical approach.

1358

The RUC reviewed the survey data for 37761 and agreed with the specialty societies' recommendation for an additional 7 minutes of positioning time based on the need to get the patient in a position where the surgeon can target the lower extremity. The RUC compared the surveyed code to its reference code, 37500 *Vascular endoscopy, surgical, with ligation of perforator veins, subfascial (SEPS)* (Work RVU=11.54). The RUC noted that the surveyed code has less intra-service time as compared to the reference code, 60 minutes and 90 minutes, respectively. In addition, the RUC compared the surveyed codes to another reference code, MPC code 36832 *Revision, open, arteriovenous fistula; without thrombectomy, autogenous or nonautogenous dialysis graft (separate procedure)* (Work RVU=10.50). The RUC noted that the surveyed code has less intra-service time as compared to the MPC reference code, 60 minutes and 90 minutes, respectively. Further, the RUC noted that the surveyed code required less technical skill, physical and mental effort and judgment to perform than the key reference code. Therefore, based on these comparisons, the RUC agreed with the specialty societies' recommended 9.00 work RVUs, the survey median, for this procedure. **The RUC recommends 9.00 Work RVUs for 37761.**

CPT Recommendation:
During the presentation to the RUC, the specialty societies indicated that ultrasound guidance would be included in the work for this procedure. Therefore, the RUC recommends that a parenthetical be added following the descriptor for 37761 that indicates that ultrasound guidance should not be reported separately.

Practice Expense:
The RUC approved the practice expense inputs as recommended by the specialty societies 090 day global standards.

Work Neutrality:
The RUC recommendations for this issue will result in a work savings that should be redistributed in the Medicare conversion factor.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
E 37760		Ligation of perforator veins, subfascial, radical (Linton type), including ~~with or without~~ skin graft when performed, open, one leg	090	10.69 (No Change)
●37761	X1	Ligation of perforator vein(s), subfascial, open, includes ultrasound guidance, when performed; one leg (For bilateral procedure, report 37761 with modifier 50) (Do not report 37760-37761 with 76998, 76937, 76942, 93971) (For endoscopic ligation of subfascial perforator veins use 37500)	090	9.00
Radiology Other Procedures				
76998		Ultrasonic guidance, intraoperative (Do not report 76998 in conjunction with 47370-47382, 36475-36479, 37760-37761)	XXX	1.20 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37761 Tracking Number X1 Specialty Society Recommended RVU: **9.00**

Global Period: 090 RUC Recommended RVU: **9.00**

CPT Descriptor: Ligation of perforator vein(s), subfascial, open, one leg

(For bilateral procedure, report 37761 with modifier 50)
(Do not report 37760-37761 with 76998, 93971)
(For endoscopic ligation of subfascial perforator veins use 37500)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman presents with her third medial left leg ulcer. It measures 3x3 cm and is deep and painful. She has palpable pedal pulses and pigmentary scarring in the gaiter distribution of the extremity. A left greater saphenous vein ligation and stripping was performed a year earlier and improved but did not completely relieve her symptoms. Duplex scanning reveals large incompetent perforating veins just cephalad to the ulcer. Open ligation of the perforators is undertaken.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Percent of survey respondents who stated they perform the procedure; In the hospital 78% , In the ASC 7%, In the office 16%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 83% , Kept overnight (less than 24 hours) 11% , Admitted (more than 24 hours) 6%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 50%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 25%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 14%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

- Review all relevant office notes, H&P, noninvasive vascular lab studies
- Update H&P (required by JCAHO)
- Review operative plan and informed consent with patient and family
- Discuss patient comorbidities and surgical approach with Anesthesiologist
- Change into OR scrubs
  Perform a limited venous duplex scan to mark the perforating vein(s) on the skin with indelible marker
  Supervise patient positioning, skin prep, and draping
- Wait for anesthetic to become effective

Description of Intra-Service Work:

- Incise skin of lower extremity 1 cm from the marked perforator taking care to avoid chronically scarred regions

- Dissect the subcutaneous tissue using retraction to expose the fascia and the perforating vein
- Incise the fascia taking care not to injure the vein
- Isolate the vein
- Place a ligature around the vein and ligate the vein
- Close the fascia with interrupted sutures
- Repeat above steps for each vein to be treated
- Irrigate wound(s) copiously with sterile saline
- Use electrocautery or suture ligation to achieve final hemostasis at all sites
- Close subcutaneous tissue in multiple layers
- Close skin

Description of Post-Service Work:

- Apply dressings
- Transfer patient to stretcher, elevate limb on pillows, accompany patient to recovery area
- Write orders
- Dictate operative note
- Communicate with family, referring and consulting physicians
- Participate with the anesthesiologist in the recovery area to ensure smooth emergence from anesthesia
- Discuss results of procedure with the patient once he/she is fully awake
- When stable, the patient is transferred to the ambulatory care area
- Write Discharge instructionsincluding activity, warnings, schedule office visit, wound checks, suture removal, etc.
- All related outpatient office visits until completion of the global period

Intra-Service intensity/complexity	3.31	3.54
Post-Service intensity/complexity	3.00	3.15

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Introduction: This new open perforator vein ligation code is being created as a product of the Five-year Review Workgroup. CPT code 37760 (Ligation of perforator veins, subfascial, radical (Linton type), with or without skin graft, open) was identified by the screen of rapidly growing services in the Medicare database. SVS suggested that most of the surgeons performing Ligation of perforator veins were not actually doing the old radical Linton type operation, but a less

invasive variation. The society therefore requested creation of 3776X, and we suspect that when this code is introduced the frequency of reporting 37760 will drop almost to nothing.

IWPUT: At the median survey recommended RVW of 9.00, and with the recommended time and visit pattern, the new service has an IWPUT of 0.074, fully consistent with the key reference service (0.073) as well as other recently RUC-valued vein excision operations.

Pre-time considerations: We are request 7 minutes of additional pre-service positioning time based on need to get the target lower extremity to be in perfect position on the table. Additional time is also required at this point to locate the "leg holder" staff person, get him/her in the room, set up with sterile gloves and/or sterile towel to appropriate hold up the leg for a full circumferential lower extremity sterile prep.

Clinical Comparison with Key Reference: The key reference service chosen by 36% of survey respondents is 37500 Vascular endoscopy, surgical, with ligation of perforator veins, subfascial (SEPS). In essence, new code 3776X accomplishes the same clinical endpoint as 37500, but through a direct open surgical approach.

Work Comparison with Key Reference: The primary difference between 37500 SEPS and new code 3776X lies in the intra-service time. New code 3776X requires 30 minutes LESS intra-time than key reference 37500 (60 min compared to 90). Otherwise, the two services have essentially the same pre-time (new code 58 min, key reference 60 min). The new service has 5 minutes LESS immediate post-service time (25 min vs. 30). Both codes are performed in the typical patient as hospital same-day discharge outpatients, and both have therefore 0.5 discharge day at 19 minutes each. The two codes have the same office visit pattern, at 62 minutes each. Intensity and complexity measures of the two codes are similar, but if anything the new service has very slightly lower I&C grades across the board.

Given these similarities, it is reasonable to estimate a work value for the new code based on the RVW of the key reference. The math entails subtracting 30 minutes of intra-time at the typical IWPUT for vein surgery of 0.070. The RVW of 37500 is 11.54. 30 minutes of intra-time at 0.070 is 2.1 RVUs. An estimated RVW of new service is 11.54 minus 2.1 = 9.44. This compares favorably with our recommended median survey value of 9.00.

Work Comparison with MPC Vascular Reference code 36832 Hemoaccess Revision: 36832 is an open revision of arteriovenous hemodialysis access that was carried through the RUC process in 1998. 36832 has an RVW of 10.50 with 90 minutes of intra-time, one office visit and 191 minutes of total time. New service 3776X is recommended at an RVW of 9.00, and it has 60 minutes of intra-time, three office visits, and 224 minutes of total time. IWPUT of 36832 is 0.090. A downward adjustment from 36832 to account for 30 minutes less intra-time can be established as 30 x 0.090 = 2.70. An upward adjustment for two more office visits in 3776X compared to 36832 can be calculated as (0.92+0.45=1.37). Thus, an estimate for new code 3776X based on 36832 is 10.50 - 2.70 + 1.37 = 9.17. This is again very close to our median survey recommended RVU of 9.00.

Work Comparison with MPC General Surgery Reference code 44950 Appendectomy: 44950 is open appendectomy, a service that was evaluated by the RUC during the second 5-year review. 44950 has an RVW of 10.52, an intra-service time of 60 minutes (same as the new code), and the same office visit pattern. In order to estimate a value for the new code based on 44950 one must start with 10.52, subtract two inpatient hospital days (1.52), subtract 0.5 discharge day visit (0.64), and add back one office visit (99212 @ 0.45). This value is 10.52-1.52-0.64 + 0.45 = 8.81. This is again quite close to the recommended RVW for the new service of 9.00, desp the lack of clinical similarity between the procedures.

Summary: Based on all the above data and comparisons, we believe the median survey RVW of 9.00 is appropriate for this new service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. New code 3776X may be co-reported in some patients with one of a variety of treatments for the greater saphenous vein or symptomatic varicose veins. These codes include: 37722 (ligation, division & stripping of greater saphenous vein (RVW 8.08), 37718 (ligation, division & stripping of short saphenous vein (RVW 7.05); stab phlebectomy (37765, 37766; RVWs 7.63 / 9.58); radiofrequency ablation of the greater saphenous vein (36475 @ 6.72), or laser ablation of the greater saphenous vein (36478 @ 6.72). In each case, the 50% multiple procedure payment reduction would be in effect for the second code.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37760, 37799 unlisted vascular procedure and 35585

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty GS	How often? Sometimes
Specialty VS	How often? Sometimes
Specialty TS	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 3600
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate twice the Medicare volume of 37760. There is no other source of data on which to make this determination

Specialty GS	Frequency 1368	Percentage 38.00 %
Specialty VS	Frequency 1152	Percentage 32.00 %
Specialty TS	Frequency 540	Percentage 15.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,800 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Please explain the rationale for this estimate. 1725 from 37760, 50 from 37799 unlisted vascular procedure and 25 from 35585

Specialty GS	Frequency 684	Percentage 38.00 %
Specialty VS	Frequency 576	Percentage 32.00 %
Specialty TS	Frequency 279	Percentage 15.50 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Practice Expense Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

X1	37761	Ligation of perforator veins, subfascial, open, one leg

Sample Size: N/A

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus committee of vascular surgeons and general surgeons agree that this procedure would not be performed in an office setting and this would not be an emergency procedure.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The clinical staff completes pre-service diagnostic and referral forms. They call the facility to schedule space and equipment needed and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. nical staff will provide and review educational materials and information including instructions on changes to dications prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carrier out. Calls may also be necessary to coordinate changes in polypharmacy with the PCP prior to the procedure.

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities
Discharge management and office visit related activities are performed.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from the Five Year Review

February 2009

Rectal Tumor Excision

CPT code 45170, *Excision of tumor, transanal approach* was identified by the Five-Year Review Identification Workgroup as potentially misvalued through its Site of Service Anomaly screen in September 2007. The Workgroup reviewed all services that include inpatient hospital visits within their global periods, but are performed less than 50% of the time in the inpatient setting, according to recent Medicare utilization data. The RUC originally recommended a two-step action. First, the RUC removed the hospital visits from the service with no impact on the associated work RVU. Second, the RUC recommended that services be surveyed. Code 45172 was also identified in the High IWPUT screen and discussed by the RUC at its February 2008 meeting. The RUC recommended that the service be referred to CPT because the current descriptor allowed reporting of the code to a bi-modal distribution of patients. In October 2008, the CPT Editorial Panel deleted 45170 (work RVU = 12.48) and replaced it with two new Category I codes to provide greater granularity, 45171, *Excision of rectal tumor, transanal approach; not including muscularis propria (ie, partial thickness)* and 45172, *Excision of rectal tumor, transanal approach; including muscularis propria (ie, full thickness).*

1372

45171
The specialty society presented the survey data from 92 general and colorectal surgeons. The RUC reviewed the intra-service physician time and noted that the median time of 45 minutes was appropriate. The specialty indicated that this service would typically be provided on an outpatient basis. The RUC agreed with the specialty society that the pre-service time package should be package #3, straightforward patient/difficult procedure, as this time most accurately reflects the work performed. However, the RUC did not agree with the specialty that 20 minutes of positioning time was correct. Survey respondents indicated that 15 minutes were necessary. Therefore, the RUC adjusted the pre-service positioning time from the 3 minutes within package #3 to 15 minutes, rather than the 20 minutes recommended by the specialty. The RUC then reviewed the survey RVU and agreed with the specialty society that the survey 25th percentile work recommendation of 8.00 was appropriate. The RUC considered the surveyed code in comparison to the key reference service, 45190, *Destruction of rectal tumor (eg, electrodesiccation, electrosurgery, laser ablation, laser resection, cryosurgery) transanal approach* (work RVU = 10.29). The RUC noted that despite similar intensity and complexity measurements between the surveyed code and the key reference code, the reference code requires 15 additional minutes of intra-service time (60

minutes and 45 minutes, respectively). Based on this comparison, the RUC agreed that the survey 25th percentile work RVU of 8.00 was appropriate. **The RUC recommends the survey 25th percentile RVU of 8.00 for 45171.**

45172

The specialty society presented the survey data from 92 general and colorectal surgeons. The RUC reviewed the intra-service physician time and noted that the median time of 75 minutes was appropriate. The RUC agreed with the specialty society that the pre-service time package should be package #4, difficult patient/difficult procedure, as this time most accurately reflects the work performed. However, the RUC did not agree with the specialty that 20 minutes of positioning time was correct. Survey respondents indicated that 15 were necessary. Therefore, the RUC adjusted the pre-service positioning time from the 3 minutes within package #4 to 15 minutes, rather than the 20 minutes recommended by the specialty. The RUC then reviewed the survey RVU and agreed with the specialty society that the survey median work RVU of 12.00 was appropriate. The RUC considered the surveyed code in comparison to the key reference service, 45190, *Destruction of rectal tumor (eg, electrodesiccation, electrosurgery, laser ablation, laser resection, cryosurgery) transanal approach* (work RVU = 10.29). The RUC noted that the key reference service requires 15 fewer minutes of intra-service time (60 minutes and 75 minutes, respectively). Code 45172 also includes a full 99238 discharge day management procedure as well as a 99231 hospital visit within its global period, whereas the reference code does not. The RUC agreed that 45172 would typically require an inpatient stay. Lastly, the RUC noted that survey respondents indicated 45172 requires greater mental effort and judgment as well as greater technical skill and physical effort than the reference code. In light of these differences, the RUC agreed that the median work RVU of 12.00 was appropriate. **The RUC recommends the survey median work RVU of 12.00 for 45172.**

1373

Practice Expense

The RUC recommended the standard 90 day global practice expense inputs.

Work Neutrality

The specialty society provided data to the RUC showing that the new coding structure will account for an overall decrease in work relative values for this family of services to be redistributed in the Medicare conversion factor. 45170 was reported 6,536 in 2007, accounting for 81,569 work RVUs. The specialty society estimates that 45171 will be reported approximately 5,000 times (5,000 x 8.00 = 40,000 work RVUs) and 45172 will be reported 2,000 times (2,000 x 12.00 = 24,000 work RVUs), which results in a reduction of 17,569 work RVUs (81,569 – (40,000 + 24,000) = 17,569).

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
D 45170		~~*Excision of rectal tumor, transanal approach*~~	090	N/A
●45171	G1	Excision of rectal tumor, transanal approach; not including muscularis propria (ie, partial thickness)	090	8.00
●45172	G2	including muscularis propria (ie, full thickness) (For destruction of rectal tumor, transanal approach see 45190)	090	12.00
45190		Destruction of rectal tumor (eg, electrodesiccation, electrosurgery, laser ablation, laser resection, cryosurgery) transanal approach (For excision of rectal tumor, transanal approach, see 45171-451X 2)	090	10.29 (No Change)

1374

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:45171 Tracking Number G1 Specialty Society Recommended RVU: **8.00**

Global Period: 090 RUC Recommended RVU: **8.00**

CPT Descriptor: Excision of rectal tumor, transanal approach; not including muscularis propria (ie, partial thickness)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male presents with rectal bleeding. Clinical and diagnostic studies confirm a small 2.5 cm benign tumor of the posterior rectal wall with the lower margin 3 to 4 cm from the anal verge. He undergoes a transanal partial thickness excision of the tumor

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Percent of survey respondents who stated they perform the procedure; In the hospital 87% , In the ASC 13%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 60% , Kept overnight (less than 24 hours) 34% , Admitted (more than 24 hours) 6%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 93%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 4%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 4%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Confirm pre-operative enemas have been carried out. Review pre-operative work-up and labs. Review prior diagnostic studies. Reexamine patient to make sure that physical findings have not changed and update H&P. Review the surgical procedure, post-op recovery in and out of the hospital, and expected outcome(s) with patient/family. Obtain informed consent. Change into scrub clothes. Review length and type of anesthesia with anesthesiologist. Verify that all necessary surgical instruments and supplies are readily available in the operative suite. Assist with patient positioning (typically prone jackknife or dorsal lithotomy) and prepping/draping as needed. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A retractor system is utilized to evert the anal canal. A large anal retractor or rectal speculum is placed and a local anesthetic agent with epinephrine is injected into the submucosal plane of the lesion. Stay sutures are placed 1 cm proximal and 1 cm distal to the lesion. A 1 cm margin is outlined around the entire lesion. A local anesthetic/ns is injected into the submucosal plane under the lesion, in order to elevate the lesion off of the underlying muscular layer. An energy source (eg, electric cautery, harmonic scalpel) is utilized to excise the entir tumor. This is performed circumferentially around the lesion along the margin. The lesion is removed and sent pathology. Hemostasis is obtained and the defect is closed.

Description of Post-Service Work: Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note. Monitor patient stabilization in the recovery room. After patient is awake,

discuss surgery outcome with patient. Examine patient to assess for the development of complications (eg, perforation, bleeding). Dictate operative report (copy PCP and/or referring physician) and complete medical record documentation. Correctly assign CPT codes including Physicians Quality and Reporting Initiative (PQRI) add-on codes where appropriate. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment ith the patient, family and other healthcare professionals, including home restrictions, especially diet, activity, bathing. Reconcile medications and write orders for post-discharge medication. Complete all appropriate medical records, including discharge summary and discharge instructions, and insurance forms. A diagnostic sigmoidoscopy will be performed at one or more office visits to assess wound healing. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	2.67	2.60

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 45170 (*Excision of rectal tumor, transanal approach*) will be deleted in 2010 and replaced by two new codes (G1 and G2). Code 45170 was reviewed twice by the RUC, resulting in survey data that indicated the typical patient stayed in the hospital for one or more nights. The code was selected for review by the RUC 5YR ID Workgroup screen for site of service anomalies. During review of the survey data for this code, the RUC determined, and the surveying specialties agreed, that code 45170 represented a bimodal distribution of patients and

that the code should be reviewed by CPT. The ASCRS and ACS presented a CCP for deletion of code 45170 and creation of two new codes (G1 and G2) that differentiated depth of excision for rectal tumors.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to position the patient prone jackknife or in dorsal lithotomy.
- Scrub/Dress/Wait: no change

G1 Recommendation: The consensus committee recommends the survey 25th percentile RVW of 8.00. This value is 33% less than the current RVW for 45170. This RVW is less than the key reference code 45190 (RVW=10.29) which has more intra-operative time. The RVW of 8.00 is also similar to MPC code 46262 (RVW=7.80), which has the same intra-op time, but slightly less post-op work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 45170

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty colon and rectal surgerey How often? Sometimes

Specialty general surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 7500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. specialty extrapolation from 2006 Medicare utilization

Specialty colon and rectal surgery Frequency 4500 Percentage 60.00 %

Specialty general surgery Frequency 3000 Percentage 40.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate based on 2006 Medicare utilization of 45170

Specialty colon and rectal surgery Frequency 3000 Percentage 60.00 %

Specialty general surgery Frequency 2000 Percentage 40.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Percent of survey respondents who stated they perform the procedure; In the hospital 99% , In the ASC 1%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 9% , Kept overnight (less than 24 hours) 40% , Admitted (more than 24 hours) 52%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 58%

, moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 4%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 4%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Confirm pre-operative enemas have been carried out. Review pre-operative work-up and labs. Review prior diagnostic studies. Reexamine patient to make sure that physical findings have not changed and update H&P. Review the surgical procedure, post-op recovery in and out of the hospital, and expected outcome(s) with patient/family. Obtain informed consent. Change into scrub clothes. Review length and type of anesthesia with anesthesiologist. Verify that all necessary surgical instruments and supplies are readily available in the operative suite. Assist with patient positioning (typically prone jackknife or dorsal lithotomy) and prepping/draping as needed. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: The patient is placed in prone jack-knife position. A retractor system is utilized to evert the anal canal. A large anal retractor or rectal speculum is placed and a local anesthetic agent with epinephrine is injected into the submucosal plane of the lesion. Stay sutures are placed 1 cm proximal and 1 cm distal to the lesion. A 1 cm or greater margin is outlined around the entire lesion. An energy source (eg, electric cautery, harmonic scalpel) is utilized to begin the full thickness excision of the tumor. The posterior rectal wall is transected through the mucosa, muscular layer, lamina propria and then through the rectal mesentery. This is performed circumferentially around the lesion along the margin. The lesion is removed and sent to pathology. Hemostasis is obtained and the defect is closed.

Description of Post-Service Work: Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note. Monitor patient stabilization in the recovery room. After patient is awake,

discuss surgery outcome with patient and examine patient to assess for the development of complications (eg, perforation, bleeding). Dictate operative report (copy PCP and/or referring physician) and complete medical record documentation. Correctly assign CPT codes including Physicians Quality and Reporting Initiative (PQRI) add-on codes where appropriate. Consider relevant data, options, and risks and make the decision to admit patient for continu hospital care. Write orders for transfer to medical floor. Visit and examine patient daily to assess wound healing bowel signs. Write orders for advancement of diet, medications, and bathing and activity restrictions. Discharge patient from hospital when relevant data, options, and risks indicate it is safe. Discuss at home treatment with the patient/family, including home restrictions, especially diet, activity, bathing. Reconcile medications and write orders for post-discharge medication. Complete all appropriate medical records, including discharge summary and discharge instructions, and insurance forms. A diagnostic sigmoidoscopy will be performed at one or more office visits to assess wound healing. Review pathology report with patient when available. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP and/or referring physician (verbal and written). Dictate progress notes for medical record.

CPT Descriptor Destruction of rectal tumor (eg, electrodesiccation, electrosurgery, laser ablation, laser resection, cryosurgery) transanal approach

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
47562	090	11.63	RUC Time	118,151

CPT Descriptor 1 Laparoscopy, surgical; cholecystectomy

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 52 **% of respondents:** 56.5 %

TIME ESTIMATES (Median)	CPT Code: 45172	Key Reference CPT Code: 45190	Source of Time RUC Time
Median Pre-Service Time	75.00	80.00	
Median Intra-Service Time	75.00	60.00	
Median Immediate Post-service Time	20.00	45.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	20.0	0.00	
Median Discharge Day Management Time	38.0	19.00	
Median Office Visit Time	62.0	62.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**290.00**	**266.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.65	3.57
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.65	3.48
Urgency of medical decision making	3.12	3.14
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.18	3.57
Physical effort required	3.59	3.17
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.39	3.05
Outcome depends on the skill and judgment of physician	4.12	3.69
Estimated risk of malpractice suit with poor outcome	3.41	3.12

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.55	3.31
Intra-Service intensity/complexity	3.71	3.24
Post-Service intensity/complexity	2.94	2.86

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 45170 (*Excision of rectal tumor, transanal approach*) will be deleted in 2010 and replaced by two new codes (G1 and G2). Code 45170 was reviewed twice by the RUC, resulting in survey data that indicated the typical patient stayed in the hospital for one or more nights. The code was selected for review by the RUC 5YR ID Workgroup screen for site of service anomalies. During review of the survey data for this code, the RUC determined, and the surveying specialties agreed, that code 45170 represented a bimodal distribution of patients and

that the code should be reviewed by CPT. The ASCRS and ACS presented a CCP for deletion of code 45170 and creation of two new codes (G1 and G2) that differentiated depth of excision for rectal tumors.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to position the patient prone jackknife or in dorsal lithotomy.
- Scrub/Dress/Wait: no change

G2 Recommendation: The consensus committee recommends the survey median RVW of 12.00. This value is slightly less than the current RVW for 45170. This RVW is greater than the key reference code 45190 (RVW=10.29) which has less intra-operative time and less post-op work. The RVW of 12.00 is also similar to MPC code 47562 (RVW=11.63), which has similar intra-op time and slightly less post-op work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 45170

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty colon and rectal surgerey How often? Sometimes

Specialty general surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. specialty extrapolation from 2006 Medicare utilization

Specialty colon and rectal surgery Frequency 1800 Percentage 60.00 %

Specialty general surgery Frequency 1200 Percentage 40.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate based on 2006 Medicare utilization of 45170

Specialty colon and rectal surgery Frequency 1200 Percentage 60.00 %

Specialty general surgery Frequency 800 Percentage 40.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Suggest using the PLI for current code 45170. Although the intra-time is significantly less than new code G2, the previous RVW is similar to the recommendation. We were not able to identify another 90-day global code that is familiar to colon and rectal surgeons and general surgeons for malignant tumor excision that has an RVW this low.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptors:

45171	Excision of rectal tumor, transanal approach; not including muscularis propria (ie, partial thickness)
45172	Excision of rectal tumor, transanal approach; including muscularis propria (ie, full thickness)

Sample Size: **N/A**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus committee of general surgeons and colon and rectal surgeons representing all types of practices and all geographic settings discussed the practice expense details for new codes G1 and G2. The consensus was that neither of these codes should be priced in the office setting. Additionally, the committee agreed that at least one of the follow-up office visits, a sigmoidoscopy would be performed to assess wound healing.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The clinical staff completes pre-service diagnostic and referral forms. They call the hospital to schedule space and equipment needed in the facility and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. Clinical staff will provide and review educational materials and information including instructions on diet and bowel cleansing prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carrier out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure.

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities
Discharge management and office visit related activities are performed. Additionally, 35 minutes (standard) for setting up and cleaning the scope at one visit have been added to the standard office visit times that do not include these additional activities.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from the Five Year Review

April 2009

Urodynamics Studies

In February 2008, the RUC identified 51726, 51772, 51795, and 51797 through the Codes Reported Together screen as they are reported together more than 95% of the time. The RUC referred to all four codes to CPT for creation of new bundled services and to reorganize the coding structure to reflect the typical procedures performed.

51727
The RUC reviewed the physician time for 51727 *Complex cystometrogram (ie, calibrated electronic equipment); with urethral pressure profile studies (ie, urethral closure pressure profile), any technique* and determined that an additional 13 minutes of pre-time package 5 Non-Facility Procedure without anesthesia, is necessary to capture evaluation and the placement of the foley and urodynamic cathethers. The specialty society indicated that the total pre-service time of 20 minutes, as indicated by the survey respondents is correct, but should all be captured in the pre-evaluation component. The specialty society recommended and the RUC agreed that an additional 5 minutes should be added to the survey intra-service time of 30 minutes, totaling 35 minutes, as it requires slightly more time than base code 51726 *Complex cystometrogram (eg, calibrated electronic equipment)* (work RVU = 1.71 and physician time of 25 minutes pre-, 30 minutes intra- and 15 minutes immediate post-service time) to perform the urethral pressure profile studies. The specialty society recommended and the RUC agreed that the survey immediate post-service time of 10 minutes is appropriate.

The RUC compared 51727 to 52000 *Cystourethroscopy (separate procedure)* (work RVU = 2.23 and 17 minutes pre, 15 minutes intra, and 10 minutes post time) and determined that urodynamics code 51727 is less intense. The RUC then reviewed reference code 70554 *Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration* (work RVU = 2.11 and 15 minutes pre, 35 minutes intra, and 10 minutes immediate post-service time) and determined that 2.11 work RVUs is an appropriate crosswalk as these two services have similar service times and intensities. The RUC also, compared 51727 to 99215 *Office Visit, Established Patient* (work RVU = 2.00 and 5 minutes pre, 35 minutes intra, and 15 minutes post time). **The RUC recommends 2.11 work RVUs for 51727 and 20 minutes pre, 35 minutes intra and 10 minutes immediate post-service time.**

51728
The RUC reviewed code 51728 *Complex cystometrogram (ie, calibrated electronic equipment); with voiding pressure studies (ie, bladder voiding pressure), any technique* and determined that it requires the same physician work and physician time as 51727.

The RUC reviewed the physician time for 51728 and determined that an additional 13 minutes to pre-time package 5 Non-Facility Procedure without anesthesia, is necessary to capture evaluation and the placement of the foley and urodynamic cathethers. The specialty society indicated that the total pre-service time of 20 minutes, as indicated by the survey respondents is correct, but should all be captured in the pre-evaluation component. The specialty society recommended and the RUC agreed that an additional 5 minutes should be added to the surveyed intra-service time of 30 minutes, totaling 35 minutes, as it requires slightly more time than base code 51726 *Complex cystometrogram (eg, calibrated electronic equipment)* (work RVU = 1.71 and physician time of 25 minutes pre-, 30 minutes intra- and 15 minutes immediate post-service time) to perform the voiding pressure studies. The specialty society recommended and the RUC agreed that the survey immediate post-service time of 10 minutes is appropriate.

The RUC compared 51728 to 52000 *Cystourethroscopy (separate procedure)* (work RVU = 2.23 and 17 minutes pre, 15 minutes intra, and 10 minutes post time) and determined that urodynamics code 51727 is less intense. The RUC then reviewed reference code 70554 *Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration* (work RVU = 2.11 and 15 minutes pre, 35 minutes intra, and 10 minutes immediate post-service time) and determined that 2.11 work RVUs is an appropriate crosswalkas these two services have similar service times and intensities. The RUC also, compared 51727 to 99215 *Office Visit, Established Patient* (work RVU = 2.00 and 5 minutes pre, 35 minutes intra, and 15 minutes post time). **The RUC recommends 2.11 work RVUs for 51728 and 20 minutes pre, 35 minutes intra and 10 minutes immediate post-service time.**

1395

51729
The RUC reviewed the physician time for 51729 *Complex cystometrogram (ie, calibrated electronic equipment); with voiding pressure studies (ie, bladder voiding pressure), and urethral pressure profile studies (ie, urethral closure pressure profile), any technique* and determined that an additional 13 minutes to pre-time package 5 Non-Facility Procedure without anesthesia, is necessary to capture evaluation and the placement of the foley and urodynamic cathethers. The specialty society indicated that the total pre-service time of 20 minutes should all be captured in the pre-evaluation component. The specialty society recommended and the RUC agreed that an additional 10 minutes should be added to the surveyed intra-service time of 30 minutes, totaling 40 minutes, as it requires slightly more time than base code 51726 *Complex cystometrogram (eg, calibrated electronic equipment)* (work RVU = 1.71 and physician time of 25 minutes pre-, 30 minutes intra- and 15 minutes immediate post-service time) and slightly more physician time to perform than the urethral pressure studies and the voiding pressure studies alone. The specialty society recommended and the RUC agreed that the survey immediate post-service time of 15 minutes is appropriate.

The RUC reviewed the increment between the base code 51726 and the recommended work RVUs for 51727 or 51728, which was 0.40 (2.11 - 1.71 = 0.40). The RUC determined that 0.40 is an appropriate increment between 51727 or 51728 compared to 51729. The RUC added the increment and determined 2.51 work RVUs for 51729 appropriately accounts for the physician work required to perform this service (2.11 + 0.40 = 2.51). The RUC also compared 51729 to a similar service 75635 *Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU = 2.40 and 10 minutes pre, 45 minutes intra, and 15 minutes immediate post-service time) and determined that this reference also supports a work RVU of 2.51 for code 51729. **The RUC recommends a work RVU of 2.51 for 51729 and 20 minutes pre, 40 minutes intra and 15 minutes immediate post-service time.**

Practice Expense
The RUC reviewed the clinical labor inputs for the typical patient and made minor edits regarding the intra-service time. The RUC also made adjustments to the medical supplies and equipment.

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Descriptor: Complex cystometrogram (eg, calibrated electronic equipment); with urethral pressure profile studies (UPP) (urethral closure pressure profile), any technique

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old woman complains of urinary stress incontinence 6-months after undergoing an anti-incontinence operation.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

s moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (3) positioning, prepping and draping the patient, and scrubbing; (4) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Calibrate electronic equipment. Insert urodynamic catheter and measure post-void residual urine. Connect catheter to infusion pump and pressure transducer and zero transducer to atmospheric pressure. Purge air from tubing.

Description of Intra-Service Work: This is an interactive examination between patient and examiner. The procedural steps vary considerably depending upon the cystometric findings. Infuse fluid into bladder and record bladder sensations and bladder volume at predefined physiological landmarks. Wait for involuntary detrusor contractions as the bladder fills and record volume and pressure measurements. If involuntary detrusor contractions occur, evidence by voiding around the catheter, the bladder should be emptied. In some instances, the examination needs to be repeated in sitting and standing positions. If in involuntary detrusor contractions are not demonstrated, assist patient to sitting and/or standing position and repeat infusion. When ready to measure urethral measure profile, begin to withdraw catheter through the urethra and record bladder sensations and bladder volume at predefined physiologic landmarks. Each rise in urethral pressure must be accounted for by careful observations and annotated. When intra-urethral pressure is at its maximum, then have patient do sustained Valsalsa maneuver and several coughs and record changes to urethral pressures. Check patient for stress incontinence.

Description of Post-Service Work: (1) all post procedure care on the day of the procedure, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable. review, interpret and dictate results of the diagnostic study.

Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.56	3.44
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.67	3.11
Urgency of medical decision making	2.56	3.33

Technical Skill/Physical Effort (Mean)

Technical skill required	4.00	3.44
Physical effort required	3.56	3.33

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.56	3.56
Outcome depends on the skill and judgment of physician	4.44	3.67
Estimated risk of malpractice suit with poor outcome	2.78	3.56

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.22	2.89
Intra-Service intensity/complexity	4.00	3.11
Post-Service intensity/complexity	3.44	3.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an INPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The expert panel reviewed the physician work associated with this proposed CPT code and made the following determination due to the lack of compelling evidence:

The recommended work value by the specialty society was determined based on 2009 RVU for 51726 plus 50% of the RVU for 51772. This 50% reduction is based on the multiple procedure reduction payment rule for CPT codes reported during the same encounter. The recommendation is as follows:

CURRENT RVUs			CURRENT INTRA-SERVICE TIME			2009 RVU plus Multiple procedu reduction payment rule (50% reduction on second & third CPT codes)
	RUC	50%*	RUC	50%	TOTAL	51727 (51726 + 51772)
51726	1.71		30			1.71 + 0.81 = 2.52
51772	1.62	0.81	20	10	40	Recommended RVU = 2.52

In addition, the intra-service time should reflect 50% of the second CPT code as well.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☒ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See table at end of SOR

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 51726 + 51772

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty Gynecology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 78998

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Incontinence is frequently an issue for patients who are too young to be in Medicare.

Specialty Urology Frequency 49944 Percentage 63.22 %

Specialty Gynecology Frequency 23715 Percentage 30.01 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 39,499 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Taken from the 2007 RUC database

Specialty Urology Frequency 24972 Percentage 63.22 %

Specialty Gynecology Frequency 11854 Percentage 30.01 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 54231 (RVU of 2.04) Selected key reference code RVUs were too high and a new crosswalk was selected to reflect a more appropriate RVU.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Question #2. Services reported with multiple procedure codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Multiple Procedure Reduction	50% RVU
51741	Complex uroflowmetry (eg, calibrated electronic equipment)	000	1.14	13	28	13	Y	.57

CPT Descriptor: Complex cystometrogram (eg, calibrated electronic equipment); with voiding pressure studies (VP); bladder voiding pressure, any technique

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 69-year-old man complains of urinary frequency, urgency, weak stream and a post void residual urine of 210 ml.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (3) positioning, prepping and draping the patient, and scrubbing; (4) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Calibrate electronic equipment. Insert urodynamic catheter and measure post-void residual urine. Connect catheter to infusion pump and pressure transducer and zero transducer to atmospheric pressure. Purge air from tubing.

Description of Intra-Service Work: This is an interactive examination between patient and examiner. The procedural steps vary considerable depending upon the cystometric findings. Infuse fluid into bladder and record bladder sensations and bladder volume at predefined physiologic landmarks. Wait for involuntary detrusor contractions as the bladder fills and record volume and pressure measurements. If involuntary detrusor contractions occur, evidenced by voiding around the catheter, the bladder should be emptied. In some instances, the examination needs to be repeated in sitting and/or standing positions. If in involuntary detrusor contractions are not demonstrated, assist patient to sitting and/or stand position and repeat infusion. Ask the patient to try to void when he feels full. Each rise in vesical pressure must accounted for by careful observations. To distinguish detrusor contractions from rises in abdominal pressure. If detrusor contractions are not demonstrated, assist patient with provocative maneuvers such as turning on water on running water or helping him relax. If still unable to void, terminate the examination. Voiding is monitored to determine

peak voiding pressure. Abdominal straining is also assessed, as is quality of the detrusor contraction. Residual urine volume is calculated after voiding is completed.

Description of Post-Service Work: (1) all post procedure care on the day of the procedure, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable. (3) review, interpret and dictate results of the diagnostic study.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Valu Recommendations for the appropriate formula and format.*

The expert panel reviewed the physician work associated with this proposed CPT code and made the following determination due to the lack of compelling evidence:

The recommended work value by the specialty society was determined based on 2009 RVU for 51726 plus 50% of the RVU for 51795. This 50% reduction is based on the multiple procedure reduction payment rule for CPT codes reported during the same encounter. The recommendation is as follows:

CURRENT RVUs			CURRENT INTRA-SERVICE TIME			2009 RVU plus Multiple procedure reduction payment rule (50% reduction on second & third CPT codes)
	RUC	50%*	RUC	50%	TOTAL	51728 (51726 + 51795)
51726	1.71		30			1.71 + 0.77 = 2.48
51795	1.53	0.77	25	12.5	40.5	

In addition, the intra-service time should reflect 50% of the second CPT code as well.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☒ Historical precedents.
   - ☐ Other reason (please explain) Patients who present with specific clinical situations may require a battery of diagnostic testing to determine the proper diagnosis. The required testing is different and determined by the physician based on the clinical situation specific to the patient and their presenting problems.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See table at end of SOR

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (3) positioning, prepping and draping the patient, and scrubbing; (4) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Calibrate electronic equipment. Insert urodynamic catheter and measure post-void residual urine. Connect catheter to infusion pump and pressure transducer and zero transducer to atmospheric pressure. Purge air from tubing.

Description of Intra-Service Work: This is an interactive examination between patient and examiner. The procedural steps vary considerably depending upon the cystometric findings. Infuse fluid into bladder and record bladder sensations and bladder volume at predefined physiologic landmarks. Wait for involuntary detrusor contractions as the bladder fills and record volume and pressure measurements. If involuntary detrusor contractions occur, evidenced by voiding around e catheter, the bladder should be emptied. In some instances, reexamination needs to be repeated in sitting and/or anding positions. If in involuntary detrusor contractions are not demonstrated, assist patient to sitting and/or standing position and repeat infusion. Ask the patient to try to void when he feels full.

Each rise in vesical pressure must be accounted for by careful observations to distinguish detrusor contractions from rises in abdominal pressure. If detrusor contractions are not demonstrated, assist patient with provocative maneuvers

such as turning on water on running water or helping him relax. When ready to measure urethral pressure profile, begin to withdraw catheter through the urethra and record bladder sensations and bladder volume at predefined physiologic landmarks. Each rise in urethral pressure must be accounted for by careful observations and annotated. When intra-urethral pressure is at its maximum, then have patient do sustained Valsalsa maneuver and several coughs and rec changes to urethral pressures. Check patient for stress incontinence. Voiding is monitored to determine peak voi pressure. Abdominal straining is also assessed, as is quality of the detrusor contraction. Residual urine volume is calculated after voiding is completed.

Description of Post-Service Work: (1) all post procedure care on the day of the procedure, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable. (3) review, interpret and dictate results of the diagnostic study.

SURVEY DATA

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
52282	000	6.39	**RUC Time**

CPT Descriptor Cystourethroscopy, with insertion of urethral stent

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
19103	000	3.69	**RUC Time**	92,574

CPT Descriptor 1 Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
45380	000	4.43	**RUC Time**	778,737

CPT Descriptor 2 Colonoscopy, flexible, proximal to splenic flexure; with biopsy, single or multiple

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 13 **% of respondents:** 28.8 %

TIME ESTIMATES (Median)	CPT Code: 51729	Key Reference CPT Code: 52282	Source of Time RUC Time
Median Pre-Service Time	20.00	40.00	
Median Intra-Service Time	40.00	50.00	
Median Immediate Post-service Time	15.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**75.00**	**122.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.53	3.40
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.47	3.40
Urgency of medical decision making	2.93	3.13

Technical Skill/Physical Effort (Mean)

Technical skill required	4.40	3.47
Physical effort required	3.47	2.87

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.07	3.40
Outcome depends on the skill and judgment of physician	4.60	3.40
Estimated risk of malpractice suit with poor outcome	3.13	3.20

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.73	2.93
Intra-Service intensity/complexity	4.20	3.40
Post-Service intensity/complexity	3.60	2.87

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The expert panel reviewed the physician work associated with this proposed CPT code and made the following determination due to the lack of compelling evidence:

The recommended work value by the specialty society was determined based on 2009 RVU for 51726 plus 50% of the RVU for 51772 and 51795. This 50% reduction is based on the multiple procedure reduction payment rule for CPT codes reported during the same encounter. The recommendation is as follows:

	CURRENT RVUs		CURRENT INTRA-SERVICE TIME			2009 RVU plus Multip procedure reduction payment rule (50% reduction on second & third CPT codes)
	RUC	50%*	RUC	50%	TOTAL TIME	51729 (51726 + 51772 + 51795)
51726	1.71		30			1.71 + 0.81 + 0.77 = 3.29
51772	1.62	0.81	20	10		
51795	1.53	0.77	25	12.5	52.5	

In addition, the time should reflect 50% of the current codes as well for the second and third codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☒ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See table at end of SOR.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 51726 + 51772 + 51795

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty Gynecology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 118498

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Incontinence is frequently an issue for patients who are too young to be in Medicare.

pecialty Urology Frequency 78636 Percentage 66.36 %

Specialty Gynecology Frequency 31793 Percentage 26.82 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 59,249 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. From the 2007 RUC database

Specialty Urology Frequency 39319 Percentage 66.36 %

Specialty Gynecology Frequency 15897 Percentage 26.83 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. CPT Code 55700 -- Selected key reference code RVUs were too high and a new crosswalk was selected to reflect a more appropriate RVU.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Question #2: Services reported with multiple CPT codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Multiple Procedure Reduction	50% RVU
51741	Complex uroflowmetry (eg, calibrated electronic equipment)	000	1.14	13	28	13	Y	.57
51784	Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique	000	1.53	10	20	10	Y	.76
51798	Measurement of post-voiding residual urine and/or bladder capacity by ultrasound, non-imaging	XXX	0	5	4	0	N	

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
000 Day Global Period
Non Facility Direct Inputs

CPT Long Descriptor: Complex cystometrogram (eg, calibrated electronic equipment); with urethral pressure profile studies (UPP) (urethral closure pressure profile), any technique

Sample Size: 106 Response Rate: 43.3 % Global Period: 000

Geographic Practice Setting %: Rural 20% Suburban 45% Urban 35%

Type of Practice %:
__25%__ Solo Practice
__45%__ Single Specialty Group
__20%__ Multispecialty Group
__10%__ Medical School Faculty Practice Plan

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The recommendations were developed by a Panel consisting of eight physicians who represents urological and gynecological practices from across the United States in a single specialty groups in suburban and urban settings. They represent the states of Washington, New York, Florida, Virginia, Tennessee, Mississippi, Colorado and Illinois.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
- Review charts
- Greet patient and provide gowning
- Obtain vital signs
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Set up and calibrate urodynamics equipment
- Prepare and position patient/monitor patient
- Apply anesthesia
- Catheterize the patient for post void residual urine
- Insert catheters and apply electrodes
- Check for resting pressures in patient before testing begins

Intra-Service Clinical Labor Activities:
- Discuss with physician and assist in determining the type of testing to be performed.
- Fill the bladder as required during the diagnostic study
- Discuss with the physician the findings of the study as it progresses

- Continuously monitor the vesicle, detrusor, voiding volume and voiding pressures
- Assist patient for standing and coughing phase to monitor pressures
- Discuss the findings with the physician to determine if any other diagnostic procedure needs to be performed
- Unhook the patient from the urodynamics equipment

Post-Service Clinical Labor Activities

- Assist patient in eliminating urine from bladder
- Clean room and instruments
- Clean urodynamics equipment
- Complete diagnostic forms
- Coordinate homecare instructions, prescriptions and follow up office visits

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from Five-Year Review

February and April 2009

Neurostimulator (Spinal)

The RUC identified 63660, *Revision or removal of spinal neurostimulator electrode percutaneous array(s) or plate/paddle(s)* in its Site of Service Anomaly screen and recommended that it be referred to the CPT Editorial Panel for revision. CMS identified 63655, *Laminectomy for implantation of neurostimulator electrodes, plate/paddle, epidural* through the CMS Fastest Growing Procedures screen and recommended that the RUC survey this service. At its October 2008 meeting, the CPT Editorial Panel deleted 63660 and created four new services to describe the work previously reported using 63660. The specialty societies requested a global period change for 63661, *Removal of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed* and 63663, *Revision including replacement, when performed, of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed* from 090 day to 010 day global periods. CMS agreed with this request however, due to a late start, the specialty societies requested and RUC agreed to allow the presentation of this issue at the April 2009 RUC meeting to allow for more time to conduct the surveys and obtain an optimal number of responses.

1446

The specialty society provided some evidence to the RUC that incorrect assumptions were made in the previous valuation of 63660, including a misleading vignette, survey and flawed crosswalk assumption. The specialty commented that code 63660 was simply too broad to be able to provide a valid measure of the work. However, the RUC did not agree that the information provided by the specialty show that the work had changed significantly. Therefore, the RUC assumes that the new family of services will be work neutral as consistent with RUC/CMS standards. The specialty also provided some evidence that the length of hospital stay for 63655 had changed since the last time is was valued and that the current value for the procedure is anomalous with other codes in the family. Specifically, the specialty stated that the current intra-service work per unit of time (IWPUT) is 0.03 whereas other similar codes have IWPUTs of roughly 0.08. The RUC did not agree that this information met the compelling evidence standards to consider increases in the work RVU of 63655. The RUC reviewed the specialty society survey data to appropriately calculate the relativity between the four new codes as well as 63655 and made the following recommendations:

63655, *Laminectomy for implantation of neurostimulator electrodes, plate/paddle, epidural*
The specialty society presented the data of a survey of 42 physicians. The survey median intra-service time was 90 minutes and the median work RVU was 13.00. Additionally, the surveyees indicated that the post-operative hospital visits include a 99231 visit as well as a 99238 discharge day management service, although the surveyees indicated a typical length of stay of only one night. Due to the inconsistency of this data, the specialty did not recommend inclusion of the 99231 hospital visit. Moreover, the specialty society reduced the number of post-operative office visits from the survey data to one 99212 and two 99213 office visits. The RUC agreed with these changes to the post-operative evaluation and management services. The specialty presented a recommendation of 11.51 RVUs to the RUC. The RUC also agreed that the survey results provide some evidence that the

current work RVU for 63655 of 11.43 is not too high. The RUC reviewed reference code 63030, *Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc, including open and endoscopically-assisted approaches; 1 interspace, lumbar* (work RVU = 13.03) and noted that the surveyed code contains identical intra-service time as the reference code (90 minutes). However, 63030 contains more pre-service time (75 minutes vs. 63 minutes), more immediate post-service work (30 minutes vs. 20 minutes), one additional 99212, and one additional 99213 post-operative hospital visits. Given the similarities of the services and taking into account the differences in time and post-operative visits, the RUC agreed that a work RVU of 11.43 maintains proper rank order with other spine surgery procedures. **Therefore, the RUC recommends the specialty-recommended physician time and a work RVU of 11.43 for CPT code 63655.**

63661, Removal of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed
The RUC reviewed the survey results of 64 physicians and agreed that the survey median physician intra-service time is appropriate. Additionally, the surveyees indicated that the post-operative hospital visits include a 99231 visit as well as a 99238 discharge day management service, although the surveyees indicated a patient is typically discharged the same day. Due to the inconsistency of this data, the specialty did not recommend inclusion of the 99231 hospital visit and recommended that only one-half 99238 discharge day management service be included. The RUC also agreed that the median physician work RVU of 5.30 placed 63661 in appropriate relativity within the family of 63655 and 63661 – 63664. The RUC reviewed reference code 62355, *Removal of previously implanted intrathecal or epidural catheter* (work RVU = 4.30, intra-service time = 30 minutes) and agreed that the two services are similar. However, the survey code contains a greater amount of intra-service time compared to the reference service (55 minutes and 30 minutes, respectively), which justifies a higher work RVU. The RUC applied a work neutrality adjustment to recommended work RVUs of 63661-63664, based on the current utilization and value for 63660 and 77002 (no longer reported separately), which results in a reduction the services by 5.06%. The 5.06% reduction was applied to the survey median work RVU of 5.30 and resulted in a recommended work RVU of 5.03. **Therefore, the RUC recommends the calculated work RVU for 63661 of 5.03.**

63662, Removal of spinal neurostimulator electrode plate/paddle(s) placed via laminotomy or laminectomy, including fluoroscopy, when performed
The RUC reviewed the survey results of 35 physicians and agreed that the survey median physician intra-service time is appropriate. Additionally, the surveyees indicated that the post-operative hospital visits include a 99231 visit as well as a 99238 discharge day management service, although the surveyees indicated a typical length of stay of only one night. Due to the inconsistency of this data, the specialty did not recommend inclusion of the 99231 hospital visit. The RUC also agreed that the survey 25th percentile physician work RVU of 11.45 placed 63662 in appropriate relativity within the family of 63661 – 63664. The RUC reviewed reference code 63030, *Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc, including open and endoscopically-assisted approaches; 1 interspace, lumbar* (work RVU = 13.03, intra-service time = 90 minutes) and agreed that the two services are similar. However, the survey code contains a smaller amount of intra-service time compared to the reference service (60 minutes and 90 minutes, respectively), the survey code also contains less pre-service time (63 minutes vs 75 minutes), and no hospital visits, whereas the reference code contains two 99231 hospital visits. These differences account for the lower recommended work RVU for 63662. The RUC applied a work neutrality adjustment to recommended work RVUs of 63661-63664, based on the current utilization and value for 63660 and 77002 (no longer reported separately), which results in a reduction the services by 5.06%. The 5.06% reduction was applied to the survey 25th percentile work RVU of 11.45 and resulted in a recommended work RVU of 10.87. **Therefore, the RUC recommends the calculated work RVU for 63662 of 10.87.**

63663, Revision including replacement, when performed, of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed

The RUC reviewed the survey results of 52 physicians and agreed that the survey median physician intra-service time is appropriate. Additionally, the surveyees indicated that the post-operative hospital visits include a 99231 visit as well as a 99238 discharge day management service, although the surveyees indicated a patient is typically discharged the same day. Due to the inconsistency of this data, the specialty did not recommend inclusion of the 99231 hospital visit and recommended that only one-half 99238 discharge day management service be included. The RUC also agreed that the median physician work RVU of 8.11 placed 63663 in appropriate relativity within the family of 63661 – 63664. The RUC reviewed reference code 63650, *Percutaneous implantation of neurostimulator electrode array, epidural* (work RVU = 7.15, intra-service time = 60 minutes) and agreed that the two services are similar. However, the survey code contains a greater amount of intra-service time compared to the reference service (90 minutes and 60 minutes, respectively), which justifies a slightly higher work RVU, maintaining rank order. The RUC applied a work neutrality adjustment to recommended work RVUs of 63661-63664, based on the current utilization and value for 63660 and 77002 (no longer reported separately), which results in a reduction the services by 5.06%. The 5.06% reduction was applied to the survey median work RVU of 8.11 and resulted in a recommended work RVU of 7.70. **Therefore, the RUC recommends the calculated work RVU for 63663 of 7.70.**

63664, Revision including replacement, when performed, of spinal neurostimulator electrode plate/paddle(s) placed via laminotomy or laminectomy, including fluoroscopy, when performed

The RUC reviewed the survey results of 32 physicians and agreed that the survey median physician intra-service time is appropriate. Additionally, the surveyees indicated that the post-operative hospital visits include a 99231 visit as well as a 99238 discharge day management service, although the surveyees indicated a typical length of stay of only one night. Due to the inconsistency of this data, the specialty did not recommend inclusion of the 99231 hospital visit. The RUC also agreed that the survey 25th percentile physician work RVU of 12.00 placed 63664 in appropriate relativity within the family of 63661 – 63664. The RUC reviewed reference code 62351, *Implantation, revision or repositioning of tunneled intrathecal or epidural catheter, for long-term medication administration via an external pump or implantable reservoir/infusion pump; with laminectomy* (work RVU = 11.54, intra-service time = 90 minutes) and agreed that the two services are similar. The survey code contains an identical intra-service time compared to the reference service (90 minutes), but requires fewer post-operative hospital visits. The reference code requires a four 99233 hospital visits, whereas the survey code requires none. However, the survey code requires greater intensity and complexity, justifying a similar, though slightly lower work RVU, maintaining rank order. The RUC also noted that the physician time of 63664 is identical to the recommended survey time for 63655. The RUC applied a work neutrality adjustment to recommended work RVUs of 63661-63664, based on the current utilization and value for 63660 and 77002 (no longer reported separately), which results in a reduction the services by 5.06%. The 5.06% reduction was applied to the survey 25th percentile work RVU of 12.00 and resulted in a recommended work RVU of 11.39. **Therefore, the RUC recommends the calculated work RVU for 63664 of 11.39.**

Practice Expense
The RUC reviewed the direct practice expense inputs as recommended by the specialty and made some minor edits to the clinical labor and medical supplies to reflect the typical patient service.

Work Neutrality Calculation
In order to maintain work neutrality between the new codes created through the deletion of 63660 (and bundling of 77002), the RUC recommends the below calculation. The total work RVUs of 63660 and 77002 are 42,859. However, the total projected work RVUs based on the non-adjusted recommendations exceeds the existing work RVUs by 5.3% (45,145). To maintain budget neutrality, the RUC multiplied each work RVU by 94.94%. The resulting values reflect the RUC's recommendations and maintain budget neutrality.

New Codes					
Code	**Work RVU**	**Frequency**	**RVU Impact**	**Work Neutrality Multiplier**	**Final Work RVU**
63661	5.30	1909	10,118	94.94%	**5.03**
63662	11.45	405	4,637	94.94%	**10.87**
63663	8.11	2892	23,454	94.94%	**7.70**
63664	12.00	578	6,936	94.94%	**11.39**
Total			**45,145**		
Existing Codes					
Code	**Work RVU**	**Frequency**	**RVU Impact**		
77002	0.54	5784	3,123		
63660	6.87	5784	39,736		
Total			**42,859**		
Work Neutrality Multiplier = 42,859 / 45,145 = 94.94%					

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Codes 63650-63688 apply to both simple and complex neurostimlators. For initial or subsequent electrode analysis and programming of neurostimulator pulse generators, see codes 95970-95975. Codes 63650, 63655, and ~~63660~~ 63661-63664 describe the operative placement, revision, replacement or removal of the spinal neurostimulator system components to provide spinal electrical stimulation. A neurostimulator system includes an implanted neurostimulator, eternal controller, extension, and collection of contracts. Multiple contacts or electrodes (4 or more) provide the actual electrical stimulation in the epidural space. For percutaneously placed neurostimulator systems (63650, ~~63660,~~ 63661, 63663), the contacts are on a catheter-like lead. An array defines the collection of contacts that are on one catheter. For systems placed via an open surgical exposure, (63655, ~~63660,~~ 63662, 63664), the contacts are on a plate or paddle-shaped surface. (Do not report 63661 or 63663 when removing or replacing a temporary percutaneoulsy placed array(s) for an external generator)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:63655 Tracking Number Specialty Society Recommended RVU: **11.51**

Global Period: 090 RUC Recommended RVU: **11.43**

CPT Descriptor: Laminectomy for implantation of neurostimulator electrodes, plate/paddle, epidural

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50 year old woman completed a successful trial of percutaneous spinal cord stimulation. the patient is to undergo laminectomy for placement of a permanent plate/paddle electrode from spinal cord stimulation

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Percent of survey respondents who stated they perform the procedure; In the hospital 90% , In the ASC 10%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 18% , Kept overnight (less than 24 hours) 55% , Admitted (more than 24 hours) 26%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 26%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 48%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 17%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Communicating with the referring physician and other health care professionals, and obtaining informed consent. The physician would obtain and review the previous operative note(s) and any pertinent radiographs and medical information regarding implant from the implant manufacturer or available medical records. Pre-service work also includes a focused examination of the patient, pre-operative scrubbing and positioning, prepping, and draping the patient. The results of preadmission testing are reviewed. The medical record is reviewed to ensure that the patient is stable for the planned surgical procedure. The preoperative history and physical examination is updated. Preoperative orders for antibiotics and sequential compression devices are written. The surgeon would meet with patient and family to review planned procedure and post-operative management, review and obtain informed consent.The surgeon would also review the type of anesthesia with anesthesiologist, verify that all required instruments and supplies are available, and assist with positioning the patient. The surgeon would also monitor/assist with draping and positioning of the patient. The surgeon would scrub and gown, and then perform the surgical "time out" with the operating and anesthesia team.

Description of Intra-Service Work: Once the "time out" procedure has been completed, the fluoroscopy unit is used to visualize the existing percutaneous leads. The skin over that site is marked and the midline infiltrated with local anesthetic. The skin incision is made and loup magnification used to dissect through the subcutaneous tissues. The quadratus lumborum fascia is opened and the paraspinous muscles are taken down to expose the T11-T12 spinous processes and lamina. The correct interspace is verified by intra-operative fluoroscopy. Rongeurs are then used to perform a laminectomy at this level. Bone edges are waxed to control bleeding and meticulous hemostasis is performed. The wound is irrigated with antibiotic irrigant. The percutaneous lead is removed and the paddle lead is unpackaged

and soaked in antibiotic solution. It is then placed into the epidural space under direct vision. Exact placement is verified by fluoroscopy and the leads are then anchored to the fascia to prevent migration. Impedance testing and stimulation is then performed to verify function of the leads. The implantation of the spinal neurostimulator pulse generator or receiver is a separately reportable procedure (CPT 63685). The paddle lead is connected to the pu generator or receiver. A final fluoroscopic image is obtained and printed for the permanent record. The incision closed and dressings are applied..

Description of Post-Service Work: The patient is observed for stability of vital signs and comfort and then the operator communicates with the patient, family, and other health care professionals (including written and telephone reports and orders) and coordinates discharge day management. Additionally, all hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure. The surgeon would write prescriptions for medications needed after discharge and instructions, such as home restrictions (i.e., diet, activity, bathing, driving), are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge progress notes, discharge summary and discharge instructions, and insurance forms. The patient is discharged when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation.
Office post-discharge work: Examine and talk with patient. Perform wound check. Remove sutures/staples if placed. Review activity and restrictions. Perform neurological exam and confirm normal strength, reflexes and sensation. Answer patient/family questions. Write medication prescriptions. Order physiotherapy, as necessary, monitor rehabilitation. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record. All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

Post-Service intensity/complexity	3.13	3.13

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

he specialties selected pre-service package 2B with modifications to account for additional time required for positioning and scrub/dress/wait. The additional time for positioning is necessary because of the care and caution that must be exercised when placing an intubated patient into a prone position. The additional scrub/dress/wait is indicated due to the time required for induction.

The specialties are recommending a calculated RVU of 11.51, which is less than the survey 25th percentile. The expert panel determined that the reference code of 63030 as was chosen by the survey respondents for 6366X2 was a more appropriate reference code than 62351 which was selected by the survey respondents. Code 62351 is valued for significant in-hospital time (3 x 99233) and a low iwput (0.022), and therefore is not the best choice to use a benchmark. Using 63030 as a more appropriate comparision code, the new value was arrived at by subtracting the va. of the hospital visits (two 99231's) associated with the 13.03 work RVU's assigned to code 63030 resulting in a recommended work RVU of 11.51 for code 63655 (13.03 - 1.52 = 11.51). The new calculated IWPUT is 0.070 which places this value within rank order within the laminectomy family of codes. The total calculated impact of this change is approximately $7500 per year.

The recommendation for the survey median is further validated by an IWPUT comparison:
63655 - with recommended RVUw and times has an IWPUT of 0.070, consistent with the other codes in this family. The recommended value also compares well with MPC code 60220 (12.29 RVUw), which has a similar intraservice time (90 minutes), similar total time (274 minutes)and slightly higher IWPUT of 0.077.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Insertion and replacement of the implanted spinal neurostimulator pulse generator or receiver is a separately reportable procedure (CPT 63685)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT code 63685; global is 010; Pre-service 48"; Intra-servic e 60"; Post-service 20"; Included within the 10 day global period are 99238 x 0.5 and 99213 x 1

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 63655

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurosurgery How often? Sometimes

Specialty Orthopedic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5226

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that the national frequency would be twice that of the Medicare population. Code 63655 was reported to Medicare 2613 times in 2007. Percentage breakdowns come from the RUC database.

Specialty Neurosurgery Frequency 3654 Percentage 69.91 %

Specialty Orthopedic Surgery Frequency 1278 Percentage 24.45 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,613 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This represents the 2007 Medicare frequency. Percentage breakdowns come from the RUC database.

Specialty Neurosurgery Frequency 1827 Percentage 69.91 %

Specialty Orthopedic Surgery Frequency 639 Percentage 24.45 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. We recommend maintaining the current PLI RVUs for this code

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:63661 Tracking Number I1 Specialty Society Recommended RVU: **5.30**

Global Period: 010 RUC Recommended RVU: **5.03**

CPT Descriptor: Removal of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 54 year-old man had a previous implantation of a dorsal column spinal stimulator for pain control with good coverage and control of pain in the affected area initially. Over time, the stimulator no longer provided coverage to the affected area despite revision and the thoracic epidural stimulator array is to be removed.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Percent of survey respondents who stated they perform the procedure; In the hospital 69% , In the ASC 28%, In the office 3%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 89% , Kept overnight (less than 24 hours) 11% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 60%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 53%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 17%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Communicating with the referring physician and other health care professionals, and obtaining informed consent. The physician would obtain and review the previous operative note(s) and any pertinent radiographs and medical information regarding implant from implant manufacturer or available medical records. Pre-service work also includes a focused examination of the patient and an update of the history and physical exam documentation. The physician would also monitor/assist with draping and positioning of the patient.

Description of Intra-Service Work: The anchoring site of the previous stimulator lead in the thoracolumbar spine is localized. The overlying soft tissue structures are anesthetized to the level of the lamina with local anesthetic. A midline incision is created and soft tissues dissected to expose the lead. The lead is cut at the site and removed from the epidural space via gentle traction. An image is obtained to document removal of the lead. Removal of the implanted spinal neurostimulator pulse generator or receiver is a separately reportable procedure (CPT 63688). The overlying tissues are closed and the site bandaged.

Description of Post-Service Work: The patient is observed for stability of vital signs and comfort and then the operato. communicates with the patient, family, and other health care professionals (including written and telephone reports and orders) and coordinates discharge day management. The physician would write prescriptions for medications needed after discharge and instructions, such as home restrictions (i.e., diet, activity, bathing, driving), are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge

progress notes, discharge summary and discharge instructions, and insurance forms. The patient is discharged when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation. Additionally, all hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

Office post-discharge work: Examine and talk with patient. Perform wound check. Remove sutures/staples if placed. Review activity and restrictions. Perform neurological exam and confirm normal strength, reflexes and sensation. Answer patient/family questions. Write medication prescriptions. Order physiotherapy, as necessary, monitor rehabilitation. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Pre-Service intensity/complexity	2.74	2.74
Intra-Service intensity/complexity	3.21	3.21
Post-Service intensity/complexity	2.53	2.63

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The RUC's Five Year Review Identification Workgroup has identified codes whose valuations include hospital inpatient and/or discharge services within their global period, but the site of service is no longer predominately in the inpatient setting. One of these codes is 63660 – Revision or removal of spinal neurostimulator electrode percutaneous array(s) or plate/paddle(s)

The RUC recommended that this code (along with the other codes in the family) be reassigned to a 10 day global period and be re-surveyed. This has been done for codes 62350, 62355, 62360, 62361, 62362, 62365, 63650, 63685, and 63688. The multi-specialty expert panel convened to undertake the surveys determined that the current descriptor for code 63660 was too broad to be able to define the work and requested that the code go back to the CPT Editorial Panel with a proposal to split code 63660 into separate codes that will describe the distinct work involved in the revision and in the removal of a percutaneous electrode when compared to the revision or the removal of a "plate/paddle" electrode array. The result is four new codes. The two codes describing procedures on a percutaneous electrode have a 10 day global and the other two describing procedures on a plate/paddle electrode array maintain a 90 day global period and are performed in an in-patient setting.

The specialties determined that pre-service package 2B with modification was an appropriate package. The modification is identical to those approved for both reference services, namely, additional time for placing the patient into a prone position.

Removal of the existing lead can be difficult: the lead is often coiled and surrounded by scar tissue.

We compared the work associated with this service to the other codes in the family, which include the key reference service 62355 (selected by 19 participants) and code 63688 (the reference service selected by 16 participants). The IWPUT for code 62355 is 0.043 and the IWPUT for code 63688 is 0.041. Using median intra-and post –service times and adjusting the survey results downward to better reflect post-operative visits, the median RVUw of 5.30 yields an IWPUT of 0.042. These values place the code into proper alignment with the rest of the family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Removal of the implanted spinal neurostimulator pulse generator or receiver is separately reported

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT code 63688 - global 010 - RVUw 5.25 - Pre-service 48" - Intra-service 55" - Post -service 20 " Included within the 10 day global period are 99238 x 0.5 and 99213 x 1.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 63660

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology	How often? Sometimes
Specialty Interventional Pain Mgmt/Pain Mgmt	How often? Sometimes
Specialty Neurosurgery	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 3816
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate that 33% of the cases previously reported with code 63660 would be reported with 6366X1. We also estimate that the national frequency would be twice that of the Medicare population. Code 63660 was reported to Medicare 5,784 times in 2007. (5784*.33 = 1,908. 1,908 * 2 = 3816)
Percentage breakdowns come from the RUC database.

Specialty Anesthesiology	Frequency 1223	Percentage 32.04 %
Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 1220	Percentage 31.97 %
Specialty Neurosurgery	Frequency 715	Percentage 18.73 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,909 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate that 33% of the cases previously reported with code 63660 would be reported with 6366X1. Code 63660 was reported to Medicare 5,784 times in 2007. (5784 * .33 = 1909)

Specialty Anesthesiology	Frequency 612	Percentage 32.05 %
Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 610	Percentage 31.95 %
Specialty Neurosurgery	Frequency 358	Percentage 18.75 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:63662 Tracking Number I2 Specialty Society Recommended RVU: **10.40**

Global Period: 090 RUC Recommended RVU: **10.87**

CPT Descriptor: Removal of spinal neurostimulator electrode plate/paddle(s) placed via laminotomy or laminectomy, including fluoroscopy, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56 year-old woman had a previous implantation of a plate/paddle dorsal column spinal stimulator for pain control with good coverage and control of pain in the affected area. Over time, the stimulator no longer provided coverage to the affected area despite revision and the plate/paddle is to be removed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Percent of survey respondents who stated they perform the procedure; In the hospital 97% , In the ASC 3%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 38% , Kept overnight (less than 24 hours) 53% , Admitted (more than 24 hours) 9%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 32%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 54%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 11%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Communicating with the referring physician and other health care professionals, and obtaining informed consent. The physician would obtain and review the previous operative note(s) and any pertinent radiographs and medical information regarding implant from the implant manufacturer or available medical records. Pre-service work also includes a focused examination of the patient, pre-operative scrubbing and positioning, prepping, and draping the patient. The results of preadmission testing are reviewed. The medical record is reviewed to ensure that the patient is stable for the planned surgical procedure. The preoperative history and physical examination is updated. Preoperative orders for antibiotics and sequential compression devices are written. The surgeon would meet with patient and family to review planned procedure and post-operative management, review and obtain informed consent.The surgeon would also review the type of anesthesia with anesthesiologist, verify that all required instruments and supplies are available, and assist with draping and positioning the patient The surgeon would scrub and gown, and then perform the surgical "time out" with the operating and anesthesia team.

escription of Intra-Service Work: The anchoring site of the previous stimulator lead in the thoracolumbar spine is ocalized with the patient under anesthesia and the overlying soft tissue structures are anesthetized using local anesthesia to the level of the lamina. A midline incision is created and soft tissues dissected to expose the lead. Removal of scar tissue and additional bone around the prior laminectomy site, along with dissection of the epidural space are performed to access and remove the preexisting paddle lead in the epidural space via gentle traction. An image is obtained to document paddle lead removal. Removal of the implanted spinal neurostimulator pulse generator or receiver is a

separately reportable procedure (CPT 63688). The pre-existing paddle lead is disconnected from the connector to the electrodes of the pulse generator or receiver. The paddle lead is removed from the anchoring site. The incision is closed and dressings are applied.

Description of Post-Service Work: The patient is observed for stability of vital signs and comfort and then the opera communicates with the patient, family, and other health care professionals (including written and telephone reports and orders) and coordinates discharge day management. Additionally, all hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure. The surgeon would write prescriptions for medications needed after discharge and instructions, such as home restrictions (i.e., diet, activity, bathing, driving), are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge progress notes, discharge summary and discharge instructions, and insurance forms. The patient is discharged when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation.
Office post-discharge work: Examine and talk with patient. Perform wound check. Remove sutures/staples if placed. Review activity and restrictions. Perform neurological exam and confirm normal strength, reflexes and sensation. Answer patient/family questions. Write medication prescriptions. Order physiotherapy, as necessary, monitor rehabilitation. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record. All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
63030	090	13.03	**RUC Time**

CPT Descriptor Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc, including open and endoscopically-assisted approaches; 1 interspace, lumbar

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
44950	090	10.52	**RUC Time**	5033

CPT Descriptor 1 Appendectomy;

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
49650	090	6.30	**RUC Time**	19,242

CPT Descriptor 2 Laparoscopy, surgical; repair initial inguinal hernia

Other Reference CPT Code	Global	Work RVU	Time Source
62351	090	11.54	**RUC Time**

CPT Descriptor Implantation, revision or repositioning of tunneled intrathecal or epidural catheter, for long-term medication administration via an external pump or implantable reservoir/infusion pump; with laminectomy

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 13 **% of respondents:** 37.1 %

TIME ESTIMATES (Median)	CPT Code: 63662	Key Reference CPT Code: 63030	Source of Time RUC Time

Intra-Service intensity/complexity	3.62	3.69
Post-Service intensity/complexity	2.85	2.92

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The RUC's Five Year Review Identification Workgroup has identified codes whose valuations include hospital inpatient and/or discharge services within their global period, but the site of service is no longer predominately in the

inpatient setting. One of these codes is 63660 – Revision or removal of spinal neurostimulator electrode percutaneous array(s) or plate/paddle(s)

The RUC recommended that this code (along with the other codes in the family) be reassigned to a 10 day global peri and be re-surveyed. This has been done for codes 62350, 62355, 62360, 62361, 62362, 62365, 63650, 63685, and 63688. The multi-specialty expert panel convened to undertake the surveys determined that the current descriptor for code 63660 was too broad to be able to define the work and requested that the code go back to the CPT Editorial Panel with a proposal to split code 63660 into separate codes that will describe the distinct work involved in the revision and in the removal of a percutaneous electrode when compared to the revision or the removal of a "plate/paddle" electrode array. The result is four new codes. The two codes describing procedures on a percutaneous electrode have a 10 day global and the other two describing procedures on a plate/paddle electrode array maintain a 90 day global period and are performed in an in-patient setting.

The specialties determined that Pre-Service Package 2B with modifications to the positioning and scrub/dress/wait time was appropriate. Extra positioning time is required to turn an intubated patient into the prone position. There is additional wait time due to the time needed to induce anesthesia.

The median service performance rate for all respondents was zero. A supplemental summary is attached that shows the responses by the aggregate, by those who have not performed the service and by those who have.

The specialties came to their recommended RVUw of 10.19 (less than the 25th percentile) by comparing this service describing the removal of a spinal neurostimulator electrode plate/paddle that was placed via laminotomy or laminectomy with the recommendations for the code that describes its initial placement (63655). The recommended values for code 63655 yield an IWPUT of 0.070. Since the intraservice time for 63655 is 90 minutes and the intraservice time for 6366X2 is 60 minutes, we deducted that intensity from median survey value (RVU 12.50).

0.070 x 30 minutes = 2.1 RVUw

12.50 - 2.1 = 10.4

We then verified this value with a comparison to code 44950 – a code with similar times and an IWPUT of 0.078. Wi[redacted] our recommended times and RVUw, code 6366X2 will have an IWPUT of 0.086.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain) Removal of the implanted spinal neurostimulator pulse generator or receiver is a separately reportable procedure (CPT 63688)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT code 63688 - global 010 - RVUw 5.25 - Pre-service 48" - Intra-service 55" - Post -service 20 " Included within the 10 day global period are 99238 x 0.5 and 99213 x 1.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 63660

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurosurgery	How often? Sometimes
Specialty Orthopedic Surgery	How often? Sometimes
Specialty Other	How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 810
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate that 7% of the cases previously reported with code 63660 would be reported with code 6366X2. We also estimate that the national frequency would be twice that of the Medicare population. Code 63660 was reported to Medicare 5,784 times in 2007 (5784 * .07 = 405. 405 * 2 = 810). Percentage breakdowns are taken from those for code 63655 - Laminotomy for implantation of neurostimulator electrodes, plate/paddle(s), epidural

Specialty Neurosurgery	Frequency 566	Percentage 69.87 %
Specialty Orthopedic Surgery	Frequency 198	Percentage 24.44 %
pecialty Other	Frequency 46	Percentage 5.67 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 405
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that 7% of the cases previously reported with code 63660 would be reported with code 6366X2. Code 6366X2 was reported to Medicare 5,784 times in 2007 (5784 * .07 = 405

Specialty Neurosurgery	Frequency 283	Percentage 69.87 %
Specialty Orthopedic Surgery	Frequency 99	Percentage 24.44 %
Specialty Other	Frequency 23	Percentage 5.67 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

dicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Surveyed Code : 63662
Surveyed Descriptor: Removal of spinal neurostimulator electrode plate/paddle(s) placed via laminotomy or laminectomy, including fluoroscopy, when performed
Surveyed Global: 90

Vignette used in survey: A 56 year old woman had a previous implantation of a plate/paddle dorsal column spinal stimulator for pain control with good coverage and control of pain in the affected area. Over time, the stimulator no longer provide coverage to the affected area despite revision and the plate/paddle is to be removed

	All responses		Svc Rate = 0		Svc Rate >0

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:63663 Tracking Number I3 Specialty Society Recommended RVU: **8.11**

Global Period: 010 RUC Recommended RVU: **7.70**

CPT Descriptor: Revision including replacement, when performed, of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 54 year-old man had a previous implantation of a dorsal column spinal stimulator for pain control with good coverage and control of pain in the affected area. The patient suffered a fall, after which the stimulator no longer provided coverage to the affected area. The thoracic epidural stimulator array is to be repositioned to once again cover the affected area.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Percent of survey respondents who stated they perform the procedure; In the hospital 71% , In the ASC 29%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 59% , Kept overnight (less than 24 hours) 38% , Admitted (more than 24 hours) 3%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform a E&M service later on the same day 53%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 60%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 27%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Communicating with the referring physician and other health care professionals, and obtaining informed consent. The physician would obtain and review the previous operative note(s) and any pertinent radiographs and medical information regarding implant from the implant manufacturer or available medical records. Pre-service work also includes a focused examination of the patient, pre-operative scrubbing and positioning, prepping, and draping the patient. The results of preadmission testing are reviewed. The medical record is reviewed to ensure that the patient is stable for the planned surgical procedure. The preoperative history and physical examination is updated. Preoperative orders for antibiotics and sequential compression devices are written. The physician would meet with patient and family to review planned procedure and post-operative management, review and obtain informed consent.The physician would also verify that all required instruments and supplies are available. The physician would also monitor/assist with draping and positioning of the patient. The physician would scrub and gown. A surgical "time out" is performed

Description of Intra-Service Work: The anchoring site of the previous stimulator lead in the thoracolumbar spine is localized and the overlying soft tissue structures are anesthetized to the level of the lamina. A midline incision is created and soft tissues dissected to expose the lead. The lead is cut at the site and removed from the epidural space via gentle traction. Using fluoroscopic guidance, a Touhy needled is advanced into the epidural space using a loss of resistance technique. Epidural location is confirmed with a percutaneous probe. A percutaneous electrode array is guided into the

epidural space through the needle and advanced toward the mid thoracic spine. The exposed end of the electrode array is attached to an external stimulator unit. Under guidance from the surgeon, a technician out of the operating field tests various electrode combinations and the lead(s) is/are physically relocated by the surgeon until the patient indicates that the dermatomal areas of his typical pain have been covered with paresthesias generated by the stimulator. The external unit is detached, the needle and stylet removed and the lead(s) is/are anchored to the fascia. Insertion or replacement of the implanted spinal neurostimulator pulse generator or receiver is a separately reportable procedure (CPT 63685). The electrode array is attached to the neurostimulator pulse generator or receiver electrode connectors and anchored in place. An image is obtained to document final placement. The incision is closed and dressings are applied.

Description of Post-Service Work: The patient is observed for stability of vital signs and comfort and then the operator communicates with the patient, family, and other health care professionals (including written and telephone reports and orders) and coordinates discharge day management. Additionally, all hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure. The surgeon would write prescriptions for medications needed after discharge and instructions, such as home restrictions (i.e., diet, activity, bathing, driving), are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge progress notes, discharge summary and discharge instructions, and insurance forms. The patient is discharged when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation.
Office post-discharge work: Examine and talk with patient. Perform wound check. Remove sutures/staples if placed. Review activity and restrictions. Perform neurological exam and confirm normal strength, reflexes and sensation. Answer patient/family questions. Write medication prescriptions. Order physiotherapy, as necessary, monitor rehabilitation. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record. All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.56	3.44
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.59	3.50
Urgency of medical decision making	2.91	2.78

Technical Skill/Physical Effort (Mean)

Technical skill required	4.22	3.88
Physical effort required	3.72	3.50

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.94	3.59
Outcome depends on the skill and judgment of physician	4.31	4.06
Estimated risk of malpractice suit with poor outcome	3.81	3.66

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.44	3.22
Intra-Service intensity/complexity	4.16	3.75
Post-Service intensity/complexity	3.16	3.13

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The RUC's Five Year Review Identification Workgroup has identified codes whose valuations include hospital inpatient and/or discharge services within their global period, but the site of service is no longer predominately in the inpatient setting. One of these codes is 63660 – Revision or removal of spinal neurostimulator electrode percutaneous array(s) or plate/paddle(s)

The RUC recommended that this code (along with the other codes in the family) be reassigned to a 10 day global period and be re-surveyed. This has been done for codes 62350, 62355, 62360, 62361, 62362, 62365, 63650, 63685, and 63688. The multi-specialty expert panel convened to undertake the surveys determined that the current descriptor for code 63660 was too broad to be able to define the work and requested that the code go back to the CPT Editorial Panel with a proposal to split code 63660 into separate codes that will describe the distinct work involved in the revision and in the removal of a percutaneous electrode when compared to the revision or the removal of a "plate/paddle" electrode array. The result is four new codes. The two codes describing procedures on a percutaneous electrode have a 10 day global and the other two describing procedures on a plate/paddle electrode array maintain a 90 day global period and are performed in an in-patient setting.

The specialties determined that pre-service package 2B with modification was an appropriate package. The modification is identical to those approved for the reference service, namely, additional time for placing the patient into a prone position.

Physicians who perform these procedures agree that is easier to place a new array than to revise one. Removal of the existing lead can be difficult: the lead is often coiled and surrounded by scar tissue.

We compared the work associated with this service to the other codes in the family, including the key reference service 63650. The IWPUT for code 63650 is 0.069. Using median intra-and post –service times and adjusting the survey results downward to better reflect post-operative visits, the median RVUw of 8.11 yields an IWPUT of 0.057. These values place the code into proper alignment with the rest of the family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Insertion or replacement of the implanted spinal neurostimulator pulse generatior or receiver is separtely reported with code 63685

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT Code 63685; global 010; RVUw 6.00; Pre-service 48"; Intra-service 60"; Post -service 20"; Included within the 10 day global period are 99238 x 0.5 and 99213 x 1

REQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 63660

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology	How often? Sometimes
Specialty Interventional Pain Mgmt/Pain Mgmt	How often? Sometimes
Specialty Neurosurgery	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 5784
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate that 50% of the cases previously reported with code 63660 would be reported with 6366X3. We also estimate that the national frequency would be twice that of the Medicare population. Code 63660 was reported to Medicare 5,784 times in 2007 Percentage breakdowns come from the RUC database.

Specialty Anesthesiology	Frequency 1854	Percentage 32.05 %
Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 1848	Percentage 31.95 %
Specialty Neurosurgery	Frequency 1084	Percentage 18.74 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,892 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate that 50% of the cases previously reported with code 63660 would be reported with 6366X3. Code 63660 was reported to Medicare 5,784 times in 2007. (5784 * .50 = 2,892)

Specialty Anesthesiology	Frequency 927	Percentage 32.05 %
Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 924	Percentage 31.95 %
Specialty Neurosurgery	Frequency 542	Percentage 18.74 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:63664 Tracking Number I4 Specialty Society Recommended RVU: **12.00**

Global Period: 090 RUC Recommended RVU: **11.39**

CPT Descriptor: Revision including replacement, when performed, of spinal neurostimulator electrode plate/paddle(s) placed via laminotomy or laminectomy, including fluoroscopy, when performed

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56 year-old woman had a previous implantation of a dorsal column spinal stimulator for pian control with good coverage and control of pain in the affected area. The lead has fractured and the stimulator no longer provides coverage to the affected area. The plate/paddle electrode is to be removed and replaced to once again cover the affected area.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 19% , Kept overnight (less than 24 hours) 60% , Admitted (more than 24 hours) 21%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 46%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 38%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 16%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Communicating with the referring physician and other health care professionals, and obtaining informed consent. The physician would obtain and review the previous operative note(s) and any pertinent radiographs and medical information regarding implant from the implant manufacturer or available medical records. Pre-service work also includes a focused examination of the patient, pre-operative scrubbing and positioning, prepping, and draping the patient. The results of preadmission testing are reviewed. The medical record is reviewed to ensure that the patient is stable for the planned surgical procedure. The preoperative history and physical examination is updated. Preoperative orders for antibiotics and sequential compression devices are written. The surgeon would meet with patient and family to review planned procedure and post-operative management, review and obtain informed consent.The surgeon would also review the type of anesthesia with anesthesiologist, verify that all required instruments and supplies are available, and assist with positioning the patient. The surgeon would also monitor/assist with draping and positioning of the patient. The surgeon would scrub and gown, and then perform the surgical "time out" with the operating and anesthesia team.

Description of Intra-Service Work: The anchoring site of the previous stimulator lead in the thoracolumbar spine is localized with the patient under anesthesia and the overlying soft tissue structures are anesthetized to the level of the lamina. A midline incision is created and soft tissues dissected to expose the lead. Scar tissue and additional bone removal around the prior laminectomy site, along with dissection of the epidural space are performed to access and

remove the preexisting paddle lead in the epidural space via gentle traction. A new paddle lead is placed through this laminectomy site using fluoroscopic guidance. The exposed end of the electrode array is attached to an external stimulator unit. Under guidance from the surgeon, a technician out of the operating field tests various electrode combinations and the lead is physically relocated by the surgeon until the patient indicates that the dermatomal areas her typical pain have been covered with paresthesias generated by the stimulator. Insertion or replacement of a implanted spinal neurostimulator pulse generator or receiver is a separately reportable procedure (CPT 63685). The paddle lead is attached to the neurostimulator pulse generator or receiver electrode connectors. The lead is anchored to the fascia. An image is obtained to document final placement. The incision is closed and the sites dressed.

Description of Post-Service Work:
Post-service includes: The patient is observed for stability of vital signs and comfort and then the operator communicates with the patient, family, and other health care professionals (including written and telephone reports and orders) and coordinates discharge day management. Additionally, all hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure. The surgeon would write prescriptions for medications needed after discharge and instructions, such as home restrictions (i.e., diet, activity, bathing, driving), are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge progress notes, discharge summary and discharge instructions, and insurance forms. The patient is discharged when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation.
Office post-discharge work: Examine and talk with patient. Perform wound check. Remove sutures/staples if placed. Review activity and restrictions. Perform neurological exam and confirm normal strength, reflexes and sensation. Answer patient/family questions. Write medication prescriptions. Order physiotherapy, as necessary, monitor rehabilitation. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record. All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

Additional Rationale

escribe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The RUC's Five Year Review Identification Workgroup has identified codes whose valuations include hospital inpatient and/or discharge services within their global period, but the site of service is no longer predominately in the inpatient setting. One of these codes is 63660 – Revision or removal of spinal neurostimulator electrode percutaneous array(s) or plate/paddle(s)

The RUC recommended that this code (along with the other codes in the family) be reassigned to a 10 day global period and be re-surveyed. This has been done for codes 62350, 62355, 62360, 62361, 62362, 62365, 63650, 63685, and 63688. The multi-specialty expert panel convened to undertake the surveys determined that the current descriptor for code 63660 was too broad to be able to define the work and requested that the code go back to the CPT Editorial Panel with a proposal to split code 63660 into separate codes that will describe the distinct work involved in the revision and in the removal of a percutaneous electrode when compared to the revision or the removal of a "plate/paddle" electrode array. The result is four new codes. The two codes describing procedures on a percutaneous electrode have a 10 day global and the other two describing procedures on a plate/paddle electrode array maintain a 90 day global period and are performed in an in-patient setting.

The specialties determined that Pre-Service package 2B with modification to the positioning and scrub/dress/wait time was appropriate. Extra positioning time is required as the patient is under anesthesia and prone. Wait time is increased as the level of anesthesia must be carefully titrated since the procedure requires a patient sufficiently sedated to tolerate the procedure yet sufficiently responsive to indicate that the dermatomal areas of her typical pain have been covered with paresthesias generated by the stimulator.

The median service performance rate for all respondents was zero. A supplemental summary is attached that shows the responses by the aggregate, by those who have not performed the service and by those who have.

This procedure is more complex than the reference service (62351) and 63655 although the surveyed times are the same as 63655. Code 6366X4 requires the surgeon to work on a previously operated field (previous laminotomy) and over the spinal cord, with accompanied increased risk for neurologic injury due to scarring from the earlier bony work. Tl intensity/complexity measures comparing 6366X4 with 62351 are consistent with this point as all but one are higher fo 6366X4. The recommendation is that the RUC accept an RVUwork value of 12.00 which is higher than 63655 but represents the 25 percentile of our survey respondents.

Code 6366X4 with the times and RVUw recommended by the specialties would have an IWPUT of 0.075.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Insertion or replacement of the implanted spinal neurostimulator pulse generator or receiver is a separately reportable procedure (CPT 63685)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in

your scenario. CPT Code 63685; global 010; Pre-service 48"; Intra-service 60"; Post -service 20"; Included within the 10 day global period are 99238 x 0.5 and 99213 x 1

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 63660

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurosurgery	How often? Sometimes
Specialty Orthopedic Surgery	How often? Sometimes
Specialty Other	How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 1156
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate that 10% of the cases previously reported with code 63660 would be reported with 6366X4. We also estimate that the national frequency would be twice that of the Medicare population. Code 63660 was reported to Medicare 5,784 times in 2007. (5784 * .10 = 578. 578 * 2 = 1156)
Percentage breakdowns are taken from those for code 63655 - Laminotomy for implantation of neurostimulator electrodes, plate/paddle, epidural

Specialty Neurosurgery	Frequency 809	Percentage 69.98 %
Specialty Orthopedic Surgery	Frequency 283	Percentage 24.48 %
Specialty Other	Frequency 65	Percentage 5.62 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 578
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that 10% of the cases previously reported with code 63660 would be reported with 6366X4. Code 6366X4 was reported to Medicare 5,784 times in 2007. (5784 8 * .10 = 578)

Specialty Neurosurgery	Frequency 404	Percentage 69.89 %
Specialty Orthopedic Surgery	Frequency 141	Percentage 24.39 %
Specialty Other	Frequency 33	Percentage 5.70 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Surveyed Code : 63664

Surveyed Descriptor: Revision including replacement, when performed, of spinal neurostimulator electrode plate/paddle(s) place via laminotomy or laminectomy, including fluoroscopy, when performed

Surveyed Global: 90

Vignette used in survey: A 56 year old woman had a previous implantation of a dorsal column spinal stimulator for pain control with good coverage and control of pain in the affected area. The lead has fractured and the stimulator no longer provided coverage to the affected area.The thoracic epidural stimulator array is to be removed and replaced to once again cover the affected area

	All Responses		Svc rate =0		Svc rate >0	
Percentage of survey respondents who found vignette to be typical:	88%		94%		80%

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

63661: Removal of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed

63663: Revision, including replacement, when performed, of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel consisting of RUC and CPT and health policy representatives of the North American Spine Society (NASS), the International Spine Intervention Society (ISIS), the American Academy of Pain Medicine (AAPM), the American Society of Anesthesiologists (ASA), the American Association of Neurological Surgeons (AANS), the Congress of Neurological Surgeons (CNS) was convened to review the practice expense inputs for the new codes shown above. The panel included physicians in solo practice, academic settings, and large group practices and represented a multitude of geographic locations.

.ease describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff completes pre-service diagnostic and referral forms. They call the hospital to schedule space and equipment needed in the facility and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. They arrange with the stimulator manufacturer for appropriate implants/supplies to be available. Clinical staff will provide and review educational materials and information prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carried out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure.

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

Discharge management and standard office visit related activities are performed.

CPT Code:63661, 63663

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation

Non Facility Direct Inputs

CPT Long Descriptor:

63661: Removal of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed

63663: Revision, including replacement, when performed, of spinal neurostimulator electrode percutaneous array(s), including fluoroscopy, when performed

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel consisting of RUC and CPT and health policy representatives of the North American Spine Society (NASS), the International Spine Intervention Society (ISIS), the American Academy of Pain Medicine (AAPM), the American Society of Anesthesiologists (ASA), the American Association of Neurological Surgeons (AANS), the Congress of Neurological Surgeons (CNS) was convened to review the practice expense inputs for the new codes shown above. The panel included physicians in solo practice, academic settings, and large group practices and represented a multitude of geographic locations.

Discussion

The consensus panel discussed the site of service for these two codes and believes both can safely be performed in an office or radiology suite. The survey respondents however felt that this location was rare (3% for 63661 and 0% for 63663). The practice patterns vary in different geographic regions and the panel is aware of physicians who perform these procedures in the non-facility setting. We have priced these two procedures for both facility and non-facility.

Both of these procedures require fluoroscopy. Currently a licensed radiation therapist is typically required by law in many states to operate the fluoroscopy machine. A second clinical assistant (staff blend RN/LPN/MA) is required to assist the physician performing the procedure.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff completes pre-service diagnostic and referral forms. They schedule space and equipment needed and arrange with the stimulator manufacturer for appropriate implants/supplies to be available. Clinical staff will provide and review educational materials and information prior to the procedure. In the office setting we moved the pre-service education from the pre-service period to the service period and decreased the time for this activity from 7 minutes to 3 minutes. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carrier out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure

The RT obtains and displays the previous images.

Intra-Service Clinical Labor Activities:

Clinical staff reviews the chart to be certain all pre-procedure testing is available and the medical history is current. The patient will be greeted and gowned and four vital signs obtained. The procedure is reviewed. The procedure room is prepared, making certain supplies and equipment necessary are available. Clinical staff assists the physician with prepping, positioning, and providing anesthesia. This is a sterile procedure therefore, once the clinical staff is gloved, they will remain in the room and assist the physician with the entire procedure. After completion of the procedure, clinical staff will monitor the patient. The panel estimates the patient is monitored 20 minutes for 63661 and 40 minutes for 63663. We allocated ¼ of this time (5 minutes and 10 minutes respectively) to staff to allow for multi-tasking. Staff will clean the room; clean the surgical instruments; check dressings; and provide instructions on wound care, follow-up visits, and prescriptions.

RT prepares the imaging equipment and inputs patient and procedure information. They position the C-arm and assist in final positioning of the patient and obtain scout films. They perform imaging as required during the procedure. At the end of the procedure, they clean the equipment and process and store hard copies of films.

Post-Service Clinical Labor Activities:

Discharge management, phone calls and standard office visit related activities are performed.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from Five-Year Review

April 2009

Injection of Anesthetic Agent

The RUC identified these services through its High Volume Growth screen and referred the services to CPT to devise an appropriate coding structure to report primary and additional injections. Additionally, several other services within the same family were identified through the CMS Fastest Growing Procedures screen and were recommended to be surveyed by the RUC (64415, 64445, 64447), while services that were identified through the RUC screen (64470, 64472, 64475, 64476) were recommended to be referred to CPT prior to review by the RUC. In response to the RUC's request, the CPT Editorial Panel deleted the four existing codes describing injection of anesthetic agent (64470, 64472, 64475, 64476) and replaced them with six new services. Three codes describe the work performed in injection within the cervical or thoracic area in a single injection, second injection, and all further injections and the other three codes describe the work performed in injection within the lumbar or sacral area in a single injection, second injection and all further injections.

1508

64490, ***Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; single level***

The specialty society presented the survey results of 116 physicians. The median survey intra-service time was 15 minutes, which the RUC agreed was appropriate, particularly in light of the fact that the existing service, 64470, includes 20 minutes of intra-service time. The survey median work RVU was 2.00. However, the specialty noted that the key reference service selected by the respondents was 62310, *Injection, single (not via indwelling catheter), not including neurolytic substances, with or without contrast (for either localization or epidurography), of diagnostic or therapeutic substance(s) (including anesthetic, antispasmodic, opioid, steroid, other solution), epidural or subarachnoid; cervical or thoracic* (work RVU = 1.91, intra-service time = 30 minutes). The specialty noted that the reference service does not include any fluoroscopic guidance, and that there are no other 000 global codes that describe both injection and image guidance. The RUC did not agree that the pre-service evaluation time presented by the specialties was appropriate. Rather, the RUC agreed that pre-service time package number 5, NF procedure without sedation/anesthesia, which allots 7 minutes for evaluation, was all that was required. The RUC understands that Evaluation and Management (E/M) services may be reported on the same date as these injections. Therefore, the RUC removed the additional 8 minutes from the specialty's recommendation and backed-out the associated work per minute (0.0224 x 7 = 0.18) from the survey median work RVU of 2.00, to arrive at a work RVU of 1.82 (2.00 – 0.18 = 1.82). The RUC also reviewed reference code 36569, *Insertion of peripherally inserted*

central venous catheter (PICC), without subcutaneous port or pump; age 5 years or older (work RVU = 1.82, intra-time = 20 minutes) and agreed that the two services are similar. **Therefore, the RUC recommends a work RVU of 1.82 for CPT code 64490.**

64491, *Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; second level*

The specialty society presented the survey results of 80 physicians for this ZZZ add-on code. The median survey intra-service time was 15 minutes, which the RUC agreed was appropriate, particularly in light of the fact that the existing service, 64472, includes 20 minutes of intra-service time. Further, the RUC noted that the base code, 64490 also contains 15 minutes of intra-services time. However, the survey respondents indicated 10 minutes of pre-service and 5 minutes of post-service time, which the specialty and the RUC agreed was inappropriate for this add-on service. Eighty percent of the survey respondents selected 64627, *Destruction by neurolytic agent, paravertebral facet joint nerve; cervical or thoracic, each additional level (List separately in addition to code for primary procedure)* (work RVU = 1.16, intra-service = 30 minutes) as the key reference service. While the intra-service times are different between the survey code and the reference code (15 and 30 minutes, respectively), the RUC agreed that the two services are very similar. However, the reference service does not contain any imaging guidance. Further, the survey median work RVU was 1.16, which the RUC agreed was appropriate and maintains the rank and relationship between the base code and the add-on procedure. **Therefore, the RUC recommends a work RVU of 1.16 with an intra-service time of 15 minutes for 64491.**

64492, *Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; third and any additional level(s)*

The specialty society presented the survey results of 75 physicians for this ZZZ add-on code. The median survey intra-service time was 13 minutes, which the specialty noted was inconsistent with the survey results for 64491. The specialty societies' expert panel recommended and the RUC agreed that the intra-service time for 644X2 should be identical to 64491. Therefore, the RUC agreed that 15 minutes was appropriate. Further, the RUC noted that the base code, 64490 also contains 15 minutes of intra-services time. However, the survey respondents indicated 5 minutes of pre-service and 5 minutes of post-service time, which the specialty and the RUC agreed was inappropriate for this add-on service. Eighty percent of the survey respondents selected 64627, *Destruction by neurolytic agent, paravertebral facet joint nerve; cervical or thoracic, each additional level (List separately in addition to code for primary procedure)* (work RVU = 1.16, intra-service = 30 minutes) as the key reference service. While the intra-service times are different between the survey code and the reference code (15 and 30 minutes, respectively), the RUC agreed that the two services are very similar. However, the reference service does not contain any imaging guidance. Further, the survey median work RVU was 1.10, which the RUC did not agree maintained the rank and relationship between the base code and the add-on procedure. Rather, the RUC agreed that the typical work of 64492 is identical to 64491 and should be valued identically. The RUC also reviewed reference code 36584, *Replacement, complete, of a peripherally inserted central venous catheter (PICC), without subcutaneous port or pump,*

through same venous access (work RVU = 1.20, intra-time = 15 minutes) and agreed that the two services are similar. **Therefore, the RUC recommends a work RVU of 1.16 with an intra-service time of 15 minutes for 64492.**

64493, *Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level*

The specialty society presented the survey results of 88 physicians. The median survey intra-service time was 15 minutes, which the RUC agreed was appropriate, particularly in light of the fact that the existing service, 64470, includes 20 minutes of intra-service time. The survey median work RVU was 1.70. However, the specialty noted that the key reference service selected by the respondents was 27096, *Injection procedure for sacroiliac joint, arthrography and/or anesthetic/steroid* (work RVU = 1.40, intra-service time = 25 minutes). The specialty noted that the reference service does not include any fluoroscopic guidance, and that there are no other 000 global codes that describe both injection and image guidance. The RUC did not agree that the pre-service evaluation time presented by the specialties was appropriate. Rather, the RUC agreed that pre-service time package number 5, NF procedure without sedation/anesthesia, which allots 7 minutes for evaluation, was all that was required. The RUC understands that Evaluation and Management (E/M) services may be reported on the same date as these injections. Therefore, the RUC removed the additional 8 minutes from the specialty's recommendation and backed-out the associated work per minute (0.0224 x 7 = 0.18) from the survey median work RVU of 1.70, to arrive at a work RVU of 1.52 (1.70 – 0.18 = 1.52). The RUC also review reference code, 95865, *Needle electromyography; larynx* (work RVU = 1.57, intra-time = 15 minutes) and agreed that the two services are similar. **Therefore, the RUC recommends a work RVU of 1.52 for CPT code 64493.**

1510

64494, *Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; second level*

The specialty society presented the survey results of 70 physicians for this ZZZ add-on code. The median survey intra-service time was 15 minutes, which the RUC agreed was appropriate, particularly in light of the fact that the existing service, 64475, includes 18 minutes of intra-service time. Further, the RUC noted that the base code, 64493 also contains 15 minutes of intra-services time. However, the survey respondents indicated 5 minutes of post-service time, which the specialty and the RUC agreed was inappropriate for this add-on service. Nearly 80% of the survey respondents selected 64623, *Destruction by neurolytic agent, paravertebral facet joint nerve; lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU = 0.99, intra-service = 16 minutes) as the key reference service. The RUC agreed that the two services are very similar with very similar intra-service times. However, the reference service does not contain any imaging guidance, which justifies a slightly higher work RVU for the surveyed code. The median survey work RVU was 1.10, which the RUC agreed was too high. However, the survey 25th percentile work RVU of 0.98 would create a rank order anomaly with the reference service. The specialty societies' expert panel recommended and the RUC agreed that 1.00 was appropriate and maintains the rank and relationship between the base code and the

add-on procedure. The RUC also noted that the survey median work RVU of 64495 was 1.00. **Therefore, the RUC recommends a work RVU of 1.00 with an intra-service time of 15 minutes for 64494.**

64495, *Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; third and any additional level(s)*
The specialty society presented the survey results of 64 physicians for this ZZZ add-on code. The median survey intra-service time was 15 minutes, which the RUC agreed was appropriate, considering that the existing service, 64475descriptor, includes 18 minutes of intra-service time. Further, the RUC noted that the base code, 64494 also contains 15 minutes of intra-services time. However, the survey respondents indicated 5 minutes of post-service time, which the specialty and the RUC agreed was inappropriate for this add-on service. More than 80% of the survey respondents selected 64623, *Destruction by neurolytic agent, paravertebral facet joint nerve; lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU = 0.99, intra-service = 16 minutes) as the key reference service. The RUC agreed that the two services are very similar with very similar intra-service times. However, the reference service does not contain any imaging guidance, which justifies a slightly higher work RVU for the surveyed code. The median survey work RVU was 1.00, which the RUC agreed was appropriate and maintains the rank and relationship between the base code and the add-on procedure. **Therefore, the RUC recommends a work RVU of 1.00 with an intra-service time of 15 minutes for 64495.**

Practice Expense
The RUC reviewed the direct practice expense inputs as recommended by the specialty and made some minor edits to the clinical labor and medical supplies to reflect the typical patient service.

Work Neutrality
The specialty society provided data to the RUC showing that the new coding structure will account for an overall decrease in work relative values for this family of services to be redistributed in the Medicare conversion factor. 64470, 64472, 64475, and 64476 were reported as follows in 2007, accounting for 1,929,084 work RVUs.

Code	Work RVU	2007 Frequency	Total work RVUs
64470	1.80	133,092	239,566
64472	1.29	215,038	277,399
64475	1.41	485,428	684,453
64476	0.98	742,516	727,666
Total work RVUs			**1,929,084**

The specialty society estimates that the new services will be reported as follows, which results in a reduction of 600,422 work RVUs.

Code	Work RVU	2007 Frequency	Total work RVUs
64490	1.82	133,092	242,227
64491	1.16	119,783	138,948
64492	1.16	35,935	41,685
64493	1.52	485,428	737,851
64494	1.00	36,885	36,885
64495	1.00	131,066	131,066
Total work RVUs			**1,328,662**

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64490 Tracking Number EE1 Specialty Society Recommended RVU: **2.00**

Global Period: 000 RUC Recommended RVU: **1.82**

CPT Descriptor: Injection(s), diagnostic or therapeutic agent, paravertebrel facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; single level

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old female has chronic neck pain radiating toward her right shoulder. Previously performed assessments, tests and therapeutic trials have demonstrated the following: She has no neurological symptoms or weakness in her arms. Physical examination revealed restricted range of motion of her cervical spine due to pain. She has pain with palpation of her cervical spine and extension of her neck. These findings are consistent with facet pain at the C4-5 level. X-rays demonstrate facet arthopathy and spondylosis at C4-5. The patient has failed conservative treatments, including physical therapy, nonsteroidal anti-inflammatory medications, and opiate therapy with persistent pain and limitations in function. An MRI demonstrated facet arthropathy at C4-5 and multilevel degenerative disc disease. An electromyogram was negative for radiculopathy. Due to her failure with conservative treatment and persistent pain, diagnostic testing with cervical facet blocks under fluoroscopic guidance on the right at the C4-5 level is indicated. This will be performed by blocking the right C4 and C5 medial branch nerves that innervate the C4-5 facet joint.
(Imaging guidance (fluoroscopy or CT) is included in this code.)

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 46%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 23%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Medical records and relevant history were reviewed with the patient, informed consent obtained, and documentation completed. The patient was taken to the fluoroscopy suite for medial branch blocks to the right C4-5 facet joint. The patient was placed on a radiolucent carbon-fiber table, prepped and draped in the usual fashion.

Description of Intra-Service Work: The patient was monitored with continuous pulse oximetry, blood pressure and ECG. A C-arm fluoroscopy machine was rotated and adjusted until the targeted facet joint and the bony landmarks corresponding to the right C4 and C5 medial branch nerves (that innervate the right C4-5 facet joint) were optimally visualized. Initially, the C4 medial branch nerve was targeted. The skin and sub-cutaneous tissues were anesthetized

with 1cc of 1% lidocaine. Then a 25-gauge 2.5-inch needle was directed towards the lateral facet pillar and groove under intermittent fluoroscopic guidance. Care was taken to avoid vital neural structures or blood vessels. Appropriate positioning of the needle tip was confirmed with multiple fluoroscopic views, including A-P and lateral projections. Approximately 0.3 cc of non-ionic contrast was injected to confirm appropriate spread around the targeted nerve exclude any vascular, epidural or intrathecal spread. Then 0.3 cc of 2 % Xylocaine MPF was slowly infiltrated aro the C4 medial branch nerve, after which the needle was removed. With the patient still prepped and draped, the fluoroscopic machine was re-oriented inferiorly and the entire procedure repeated to block the C5 medial branch nerve. Thereafter, a bandage was applied and the patient was taken to the recovery area

Description of Post-Service Work: The patient was monitored for an appropriate period of time prior to being discharged to home. Patient was examined and pain levels assessed prior to discharge.

Intra-Service intensity/complexity	3.84	3.76
Post-Service intensity/complexity	2.89	2.84

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an INPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The specialties determined that Pre-service package 5 with some modification was the best fit for this procedure. The evaluation time was increased by 8 minutes to account for the thoroughness of the exam, the large number of records and imaging studies that must be reviewed and the time it takes to explain the procedure to the patient. Cervical facet

injections are typically performed with the patient in the prone position and that requires 5 minutes of positioning time. These procedures are performed under sterile conditions requiring 5 minutes of scrub/dress/wait time.

It appears that our survey participants may not have fully understood that they were to include the work associated v fluoroscopy (or CT) in their responses. There are no other zero day global codes that include imaging guidance so were unable to provide an example in our Reference Service List. Fluoroscopic guidance (code 77003) has a work RVU of 0.60. If this were added to the value of the current code (64470 with 1.85 RVUw) the result with be 2.45 RVUw. We are recommending the survey median of 2.00 which we believe understates the work; subtracting fluoroscopy means that the work of the injection is captured by the remaining 1.40 RVUw commensurate to an SI injection (code 27096) and well below that of the reference service. The risks of a cervical facet injection include, but are not limited to: potential seizures from placement of anesthetic in the vertebral artery, nerve root damage and quadriplegia from injection into the nerve roots or spinal cord.

A work RVUw of 2.00 somewhat aligns with the work differential between cervical/thoracic and lumbar/sacral injections which is typically 0.37 - 0.44 (example: the tranlaminar epidural codes 62310 and 62311 (1.91-1.54 = 0.37). Our recommendation for code 64490 is validated by the survey median of 1.70 for code 64493 (Injection(s) diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level)

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code could could be reported on its own or in conjunction with +64XX1 - an add-on code to describe the second level and +64XX2 - an add-on code to describe the third and any level(s).

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64470

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Pain Mgmt/Pain Mgmt — How often? Commonly

Specialty Anesthesiology — How often? Commonly

Specialty Physical Medicine & Rehabilitation How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 266184
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that the national figure would be twice the Medicare frequency. Per the RUC database, the 2007 frequency for code 64470 as 133,092. Percentages come from the RUC database.

Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 79376	Percentage 29.81 %
Specialty Anesthesiology	Frequency 68596	Percentage 25.77 %
Specialty Physical Medicine & Rehabilitation	Frequency 29467	Percentage 11.07 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 133,092 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2007 Frequency per RUC data base was 133,092. Percentages also from RUC database

Specialty Interventional Pain Mgmg/Pain Mgmt	Frequency 39688	Percentage 29.81 %
Specialty Anesthesiology	Frequency 34298	Percentage 25.77 %
Specialty Physical Medicine & Rehabilitation	Frequency 14733	Percentage 11.06 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64491 Tracking Number EE2 Specialty Society Recommended RVU: **1.16**

Global Period: ZZZ RUC Recommended RVU: **1.16**

CPT Descriptor: Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; second level (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old female has chronic neck pain radiating toward her right shoulder. Previously performed assessments, tests and therapeutic trials have demonstrted the following: She has no neurological symptoms or weakness in her arms. Physical examination revealed restricted range of motion of her cervical spine due to pain. She has pain with palpation of her cervical spine and extension of her neck. These findings are consistent with facet pain at the C4-C5 and C5-6 levels. X-rays demonstrated facet arthropathy and spondylosis at C4-C5 and C5-6. The patient has failed conservative treatments including physical therapy, nonsteroidal anti-inflammatory medications, opiate therapy with persistent pain and limitations in function. An MRI demonstrated facet arthropathy at C4-C5 and C5-6 along with multilevel degenerative disc disease. An electromyogram was negative for radiculopathy. Due to her failure with conservative treatment and persistent pain, diagnostic testing with cervical facet blocks under fluoroscopic guidance on the right at the C4-C5 and C5-6 levels is indicated. This will be performed by blocking the right C4, C5 and C6 medial branch nerves that innervate the C4-C5 and C5-6 facet joints.
(Imaging guidance (fluoroscopy or CT) is included in this code.)
(Code 64XXT includes only the work associated with injection of the second level.)

64491

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 42%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 25%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: After injections are placed at the C4-5 joint's medial branch nerves, and with the patient still prepped and draped, the fluoroscopic machine was re-oriented inferiorly and the entire procedure was repeated to block the C5-6 joint's medial branch nerves

Description of Post-Service Work:

Additional Rationale

escribe the process by which your specialty society reached your final recommendation. *If your society has used an NPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The specialties are recommending the survey median of 1.16 work RVUs – a value that will accurately maintain the relationship between the intra-service work of the primary procedure and the work associated with the add-on code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code would always be reported in conjunction with code 64XX0 (the primary procedure code). It may also be reported in conjunction with 64XX2 (a second add on to be used for the third and any additional level(s)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64472

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Pain Mgmt/Pain Mgmt	How often? Commonly
Specialty Anesthesiology	How often? Commonly
Specialty Physcial Medicine & Rehabilitation	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 239566
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate that 90% of the patients receiving a single level injection will also undergo injection of a second level. Our estimate for a single level injection was 266,184. (266,184 * .90=239,566). Percentages come from the RUC database.

Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 83728	Percentage 34.94 %
Specialty Anesthesiology	Frequency 73283	Percentage 30.58 %
Specialty Physical Medicine & Rehabilitation	Frequency 24532	Percentage 10.24 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 119,783 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that 90% of the patients receiving a single level injection will also undergo injection of a second level. Our estimate for a single level injection was 133,092 (133,092 * .90=119,783). Percentages come from the RUC database

Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 41864	Percentage 34.94 %
Specialty Anesthesiology	Frequency 36642	Percentage 30.59 %
Specialty Physical Medicine & Rehabilitation	Frequency 12266	Percentage 10.24 %

Do many physicians perform this service across the United States? Yes

Additional Rationale

escribe the process by which your specialty society reached your final recommendation. *If your society has used an /PUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The specialties are recommending 1.16 work RVUs – a value that will accurately maintain the relationship between the intra-service work of the primary procedure and the work associated with the add-on code. This is the same value recommended for code +64491 – used to report injection of a second level. The incremental work is the same for each

of the add-on codes in this family. In three out of the four add-on codes, the surveys' median intraservice time was 15 minutes. The median was 13 minutes for this specific code as one of the specialties median response was only 7 minutes. The median intraservice time from the other specialties ranged from 12.5 to 25 minutes.

CPT will include an instruction that code 64492 should only be reported once per day.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code would always be reported in conjunction with 64XX0 (the primary procedure code) and 64XX1 (the add on code to describe the second level injected.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64472

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Pain Mgmt/Pain Mgmt	How often? Commonly
Specialty Anesthesiology	How often? Commonly
Specialty Physical Medicine & Rehabilitation	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 71870
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate that 30% of the patients who receive injections at two levels will also undergo injection at three or more levels. We estimated that 239,566 patients would undergo injection at two levels (239,566 * .30 = 71,870). Percentages come from the RUC database.

Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 25118	Percentage 34.94 %
Specialty Anesthesiology	Frequency 21985	Percentage 30.58 %
Specialty Physical Medicine & Rehabilitation	Frequency 7359	Percentage 10.23 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 35,935 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that 30% of the patients who receive injections at .wo levels will also undergo injection at three or more levels. We estimated that 119,783 patients would under go injection at two levels (119,783 * .30 = 35,935). Percentages come from the RUC database.

Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 12559	Percentage 34.94 %
Specialty Anesthesiology	Frequency 10992	Percentage 30.58 %
Specialty Physical Medicine & Rehabilitation	Frequency 3680	Percentage 10.24 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64493 Tracking Number EE4 Specialty Society Recommended RVU: **1.70**

Global Period: 000 RUC Recommended RVU: **1.52**

CPT Descriptor: Injection(s), diagnostic or therapeutic agent, paravertebrel facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male has chronic right low back pain with radiation toward his buttock, limiting his ability to stand and walk for more than ten minutes. Previously performed assessments, tests and therapeutic trials have demonstrated the following: He has no radicular pain or weakness in his legs. He denies any bowel or bladder symptoms. Examination revealed no neurologic deficits, but the patient's pain complaints are reproduced by extension and palpation of the lumbar spine. X-rays demonstrated lumbar spondylosis at L3-4. The patient has failed treatment with physical therapy, non-steroidal anti-inflammatory medications and opiate therapy. An MRI demonstrated facet arthropathy at the L3-4 level and some mild multilevel degenerative disc disease. An electromyogram was negative for radiculopathy. Due to his failure with conservative care, diagnostic testing with a lumbar facet block under fluoroscopic guidance on the right at the L3-4 level is indicated. (Imaging guidance (fluoroscopy or CT) is included in this code.)

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 36%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 18%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Medical records and relevant history were reviewed with the patient, informed consent was obtained, and documentation completed. The patient was taken to the fluoroscopy suite for a right L3-4 facet joint injection. The patient was placed on a radiolucent carbon-fiber table in the prone position and prepped and draped in the usual fashion

Description of Intra-Service Work: The patient was monitored with continuous pulse oximetry, blood pressure and ECG monitors. The C-arm fluoroscopy machine was rotated and adjusted until the targeted facet joint (L3-4) was optima viewed. The skin and sub-cutaneous tissues were anesthetized with 3cc of 1% lidocaine. Then a 25-gauge 3.5-inc spinal needle was directed towards the facet joint under intermittent fluoroscopic guidance. Care was taken not to inadvertently injure vital neural structures or blood vessels. Once the joint was cannulated, approximately 0.2 cc of non-ionic contrast was infiltrated to confirm intra-articular spread and exclude any intra-vascular spread. Then a mixture

containing 0.3 cc of betamethasone (6mg/cc) mixed with 0.3 cc of 0.5% bupivacaine was slowly infiltrated into the facet joint. The needle was removed, a bandage was applied and the patient taken to the recovery area.

Description of Post-Service Work: The patient was monitored for an appropriate amount of time prior to being discharged to home. Patient was examined and pain levels assessed prior to discharge.

Time Segments (Mean)

Pre-Service intensity/complexity	2.83	2.70
Intra-Service intensity/complexity	3.30	3.17
Post-Service intensity/complexity	2.67	2.57

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Va' Recommendations for the appropriate formula and format.*

The specialties determined that Pre-service package 5 with some modification was the best fit for this procedure. The evaluation time was increased by 8 minutes to account for the thoroughness of the exam, the large number of records and imaging studies that must be reviewed and the time it takes to explain the procedure to the patient. Lumbar facet

injections are performed with the patient in the prone position and that requires 5 minutes of positioning time. These procedures are performed under sterile conditions requiring 5 minutes of scrub/dress/wait time.

It appears that our survey participants may not have fully understood that they were to include the work associated with fluoroscopy (or CT) in their responses. There are no other zero day global codes that include imaging guidance so we were unable to provide an example in our Reference Service List. Fluoroscopic guidance (code 77003) has a work RVU of 0.60. If this were added to the value of the current code (64475 with 1.41 RVUw) the result with be 2.01 RVUw. We are recommending the survey median of 1.70 which we believe understates the work; subtracting fluoroscopy means that the work of the injection is captured by the remaining 1.10 RVUw, less than the 1.15 RVUw assigned to a percutaneous insertion of an arterial line (code 36620)

A work RVUw of 1.70 will somewhat align with the work differential between cervical/thoracic and lumbar/sacral injections which is typically 0.37 - 0.44 (example: the tranlaminar epidural codes 62310 and 62311 (1.91-1.54 = 0.37). Our recommendation for code 64493 is validated by the survey median of 2.00.for code 64491 (Injection(s) diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; single level)

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code could be reported on its own or in conjunction with +644X4 - an add-on code to describe the second level and +64XX5 - an add on code to describe the third and any additional level(s).

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64475

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology — How often? Commonly

Specialty Interventional Pain Mgmt/Pain Mgmt — How often? Commonly

Specialty Physical Medicine & Rehabilitation — How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 970856
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that the national figure would be twice the Medicare frequency. Per the RUC database, the 2007 frequency for code 64475 was 485,428. Percentages come from the RUC database.

Specialty Anesthesiology	Frequency 311936	Percentage 32.12 %
Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 284946	Percentage 29.34 %
Specialty Physcial Medicine & Rehabilitation	Frequency 128541	Percentage 13.23 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 485,428 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2007 Frequency per the RUC database was 485,428. Percentages also from the RUC database.

Specialty Anesthesiology	Frequency 155968	Percentage 32.12 %
Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 142473	Percentage 29.34 %
Specialty Physical Medicine & Rehabilitation	Frequency 64271	Percentage 13.24 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS

CPT Code:64494 Tracking Number EE5 Specialty Society Recommended RVU: **1.00**

Global Period: ZZZ RUC Recommended RVU: **1.00**

CPT Descriptor: Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; second level (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male has chronic right low back pain with radiation toward his buttock, limiting his ability to stand and walk for more than ten minutes. Previously performed assessments, tests and therapeutic trials have demonstrated the following: He has no radicular pain or weakness in his legs. He denies any bowel or bladder symptoms. Examination revealed no neurologic deficits, but the patient complains of chronic right low back pain with radiation toward his buttock, which limits his ability to stand and walk for more than ten minutes. He has no radicular pain but the patient's complaints are reproduced by extension and palpation of the lumbar spine. X-rays demonstrated lumbar spondylosis at the L3-4 and L4-5 levels. The patient failed prior treatment with physical therapy, non-steroidal anti-inflammatory medications and opiate therapy. Despite these treatments, the patient has had no improvement in pain or function. An MRI demonstrated facet arthropathy at the L3-4 and L4-L5 levels and some mild multilevel degenerative disc disease. An electromyogram was negative for radiculopathy. Due to his failure with conservative care, diagnostic testing with a lumbar facet blocks under fluoroscopic guidance on the right at the L3-4 and L4-L5 and levels is indicated. (Imaging guidance (fluoroscopy or CT) is included in this code.) (Code 64XX4 includes only the work associated with injection of the second level.)

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 37%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 20%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

escription of Intra-Service Work: After an injection of the L3-4 facet joint and with the patient still prepped and draped, the C-arm fluoroscopy machine was re-oriented and the entire procedure was repeated at the L4-L5 facet joint.

Description of Post-Service Work:

Post-Service intensity/complexity	2.53	2.64

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Valu Recommendations for the appropriate formula and format.*

The specialties are recommending a work RVU of 1.00 - slightly less than the survey median to maintain the relationship between the intra-service work of the primary procedure and the work associated with the add-on code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code would always be reported in conjunction with code 64XX3 (the primary procedure code). It may also be reported in conjunction with 64XX5 (a second add on to be used for the third and any additional level(s)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64476

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology	How often? Commonly
Specialty Interventional Pain Mgmt/Pain Mgmt	How often? Commonly
Specialty Physical Medicine & Rehabilitation	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 873770
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.. We estimate that 90% of the patients receiving a single level injection will also undergo injection of a second level. Our estimate for a single level injection was 970,856 (970,856 * .90 = 873,770). Percentages come from the RUC database.

Specialty Anesthesiology	Frequency 310101	Percentage 35.49 %
Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 288781	Percentage 33.05 %
Specialty Physcial Medicine and Rehabilitation	Frequency 99785	Percentage 11.42 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 436,885 If this is a recommendation from multiple specialties please estimate frequency and percentage for each

specialty. Please explain the rationale for this estimate. We estimate that 90% of the patients receiving a single level injection will also undergo injection of a second level. Our estimate for a single level injection was 485,428 (485,428 * .90 = 436,885). Percentages come from the RUC database.

Specialty Anesthesiology	Frequency 155051	Percentage 35.49 %
Specialty Interventional Pain Mgmt/Pain Mgmt	Frequency 144473	Percentage 33.06 %
Specialty Physical Medicine & Rehabilitation	Frequency 49892	Percentage 11.41 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64495 Tracking Number EE6 Specialty Society Recommended RVU: **1.00**

Global Period: ZZZ RUC Recommended RVU: **1.00**

CPT Descriptor: Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; third and any additional level(s) (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male has chronic right low back pain with radiation toward his buttock, limiting his ability to stand and walk for more than ten minutes. Previously performed assessments, tests and therapeutic trials have demonstrated the following: He has no radicular pain or weakness in his legs. He denies any bowel or bladder symptoms. Examination revealed no neurologic deficits, but the patient's pain complaints are reproduced by extension and palpation of the lumbar spine. X-rays demonstrated lumbar spondylosis at the L3-L4, L4-L5 and L5-S1 levels. The patient failed prior treatment with physical therapy, non-steroidal anti-inflammatory medications and opiate therapy. Despite these treatments, the patient has had no improvement in pain or function. An MRI demonstrated facet arthropathy at the L3-L4, L4-L5 and L5-S1 levels and some mild multilevel degenerative disc disease. An electromyogram was negative for radiculopathy. Due to his failure with conservative care, diagnostic testing with a lumbar facet blocks under fluoroscopic guidance on the right at the L3-L4, L4-L5 and L5-S1 levels is indicated. (Imaging guidance (fluoroscopy or CT) is included in this code.) (Code 64XX5 includes only the work associated with injection of the third and any additional levels.)

Percentage of Survey Respondents who found Vignette to be Typical: 0%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 39%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 19%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: After injections at the L3-4 and L4-5 joints, and with the patient still prepped and draped in the prone position, the C-arm fluoroscopy machine was re-oriented and the entire procedure was repeated the L5-S1 facet joint.

Description of Post-Service Work:

000 Day Global Period
Facility Direct Inputs

CPT Long Descriptor:

64490: Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; single level

64493: Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; single level

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel consisting of RUC and CPT and health policy representatives of the North American Spine Society (NASS), the American Academy of Pain Medicine (AAPM), the American Academy of Physical Medicine and Rehabilitation (AAPM&R), the International Spine Intervention Society (ISIS), the American Society of Anesthesiologists (ASA), the American Association of Neurological Surgeons (AANS), the Congress of Neurological Surgeons (CNS) was convened to review the practice expense inputs for the newly revised facet injection codes. The panel included physicians in solo practice, academic settings, and large group practices and represented a multitude of geographic locations.

History

The practice expense inputs for 52 for the spinal injection codes were presented to the practice expense review committee in August of 2001. Many of these codes require imaging for performance. The imaging code 76005 was presented to the practice expense review committee in 2003. In order to assure the absence of duplication of inputs when these codes were billed together, in January 2004 the injection codes were reexamined in conjunction with the separate imaging code and further refined.

During the 2001 and 2003 presentations, it was concluded that one clinical staff person, a mixed staff blend RN/LPN/MA assisted during the procedure. The consensus panel convened to review the newly created facet codes has identified a change in the standard of practice during the past 6-8 years. Currently a licensed radiation therapist is typically required by law in many states to operate the fluoroscopy machine. A second clinical assistant is required to assist the physician performing the procedure.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff completes pre-service diagnostic and referral forms. They call the hospital to schedule space and equipment needed in the facility and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. Clinical staff will provide and review educational materials and information prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carried out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure. The staff blend times which are recommended are unchanged from the values approved by the PEAC and RUC in January 2004.

tra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

Phone calls and call in prescriptions are completed.

Pre-Service Clinical Labor Activities:

The clinical staff completes pre-service diagnostic and referral forms. They schedule space and equipment needed. Clinical staff will provide and review educational materials and information prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carried out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure.

The staff blend times which are recommended are unchanged from the values approved by the PEAC and RUC in January 2004.

The RT obtains and displays the previous images.

Intra-Service Clinical Labor Activities:

Clinical staff reviews the chart to be certain all pre-procedure testing is available and the medical history is current. The patient will be greeted and gowned and four vital signs obtained. The procedure is reviewed. The procedure room is prepared, making certain supplies and equipment necessary are available. Clinical staff assists the physician with prepping, positioning, and providing anesthesia. The clinical staff remain in the room and assist the physician with the entire procedure. After completion of the procedure, clinical staff will monitor the patient. The panel estimates the patient is monitored for 40 minutes. We allocated ¼ of this time (10 minutes) to staff to allow for multi-tasking. Staff will clean the room; check dressings; and provide instructions on pain control and follow-up visits.

RT prepares the imaging equipment and inputs patient and procedure information. They position the C-arm and assist in final positioning of the patient and obtain scout films. They perform imaging as required during the procedure. At the end of the procedure, they clean the equipment and process and store hard copies of films.

Post-Service Clinical Labor Activities:

Phone calls and call in prescriptions are completed.

64492: Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; third and any additional level(s)

64494: Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; second level

64495: Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), lumbar or sacral; third and any additional level(s)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel consisting of RUC and CPT and health policy representatives of the North American Spine Society (NASS), the American Academy of Pain Medicine (AAPM), the American Academy of Physical Medicine and Rehabilitation (AAPM&R), the International Spine Intervention Society (ISIS), the American Society of Anesthesiologists (ASA), the American Association of Neurological Surgeons (AANS), the Congress of Neurological Surgeons (CNS) was convened to review the practice expense inputs for the newly revised facet injection codes. The panel included physicians in solo practice, academic settings, and large group practices and represented a multitude of geographic locations.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:
The clinical staff remains in the room and assists the physician while the additional levels are injected.

The RT remains in the room and performs imaging as required while the additional levels are injected.

Post-Service Clinical Labor Activities:

We added an additional 2 minutes for a longer phone call for 64492 and 64495. When multiple levels (three or more) are injected, patients typically require longer times coordinating pain and prescriptions

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from the Five Year Review

February 2009

Myocardial Perfusion Imaging

The RUC identified 78465, 78478, and 78480 as potentially misvalued through its Codes Frequently Reported Together screening mechanism, as combinations of these codes are reported together more than 95% of the time. To address its concerns, the RUC recommended that the services be referred to CPT to create bundled services that accurately describe the work that is typically performed. The CPT Editorial Panel, at its October 2008 meeting, deleted the existing family of myocardial perfusion imaging services (which included 78460, 78461, 78464, 78465, 78478, and 78480) and created four new Category I CPT codes to describe the work. These new codes are 78451, *Myocardial perfusion imaging; tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic),* 78452, *Myocardial perfusion imaging, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection*, 78453, *Myocardial perfusion imaging, planar (including qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic),* and 78454, *Myocardial perfusion imaging, planar (including qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection*

1570

78452

The RUC discussed CPT code 78452, which is the most complex code within this family and accounts for the greatest utilization. The specialty society provided a detailed description of the work included within the service. The RUC discussed the survey results and noted that there was an exceptionally high median survey performance rate among the 83 respondents, which adds significant support to the survey data. As such, the RUC agreed that the median survey physician times of 10 minutes pre-service, 20 minutes intra-service, and 10 minutes immediate post-service time accurately reflect the time required to perform this service. However, the RUC agreed that the median survey work RVU of 1.87 was too high and did not accurately reflect the work being performed in the surveyed code. The RUC agreed that the key reference service, 78492, *Myocardial imaging, positron emission tomography (PET), perfusion; multiple studies at rest and/or stress*, was inappropriate because of the wide difference in intra-service time between the

survey code and reference code (20 minutes and 55 minutes, respectively). The RUC agreed a better reference code for 78452 is MPC code 70496, *Computed tomographic angiography, head, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU = 1.75, pre-service = 8, intra-service = 20, post-service = 10). The RUC and the specialty society presenters agreed that the two services are comparable in intensity and work. However, the RUC did note that the surveyed code contains two additional minutes of pre-service time, which is related to the physician management of the injection. **With a direct crosswalk from reference code 70496, the RUC recommends a work RVU of 1.75 for CPT code 78452.**

78451

The RUC reviewed the specialty society's survey results and work RVUs recommended by the specialty society for 78451. The RUC discussed the survey results and noted that there was an exceptionally high median survey performance rate among the 83 respondents, which adds significant support to the survey responses. The RUC agreed that that survey physician times of 10 minutes pre-service, 15 minutes intra-service, and 10 minutes immediate post-service time accurately reflect the time required to perform this service. However, the RUC agreed that the median work RVU of 1.50 was too high and did not accurately reflect the work being performed in the surveyed code. In order to maintain relativity with 78452, the RUC derived the recommended RVU for 78451 by calculating the relationship between the median survey RVUs of X1 and X2 and maintaining this relationship between the recommended RVU for 78451 and 78452. The survey work RVU relationship between 78451 : 78452 is (1.50 : 1.87) resulting in a relationship between the recommended RVU for 78451 : 78452 (1.40 : 1.75).

1571

78451 =	1.50	*1.40*
78452 =	1.87	1.75

The RUC agreed that this computed work RVU, 1.40 RVUs, maintains the relativity of the original survey data and is an appropriate measure of the work for 78451. The RUC also compared 78451 to 45308, *Proctosigmoidoscopy, rigid; with removal of single tumor, polyp, or other lesion by hot biopsy forceps or bipolar cautery* (work RVU = 1.40, intra-service time = 15 minutes) and agreed that it supports the RUC's recommendation of 1.40 work RVUs for 78451. **The RUC recommends a work RVU of 1.40 for CPT code 78451, which maintains the relativity between the 78451 and 78452 and is the appropriate value for the service.**

78453

The RUC reviewed the survey results for 78453 agreed with the specialty society that the survey median physician times were too high, and did not reflect the time required to perform this service. The RUC agreed that the surveyed 25th percentile physician time (pre-service = 5, intra-service = 10, post-service = 5) and 25th percentile work RVU of 1.00 accurately reflects the work and time

required to perform this service. In addition, the RUC compared 78453 to 78315, *Bone and/or joint imaging; 3 phase study* (work RVU = 1.02, pre-service = 5, intra-service = 8, post-service = 5) and noted the similarity in the physician time and work. **Therefore, the RUC recommends the 25th percentile time and work RVU of 1.00 for CPT code 78453.**

78454

The RUC reviewed the survey results for 78454 and agreed with the specialty society that the survey median physician times were too high, and did not accurately reflect the time required to perform this service. The RUC agreed that the surveyed 25th percentile times (pre-service = 5, intra-service = 15, post-service = 5) and that the 25th percentile work RVU of 1.34 accurately reflect the work and time required to perform this service. In addition, the RUC compared 78453 to 73721, *Magnetic resonance (eg, proton) imaging, any joint of lower extremity; without contrast material* (work RVU = 1.35, pre-service = 0, intra-service = 20, post-service = 0). The RUC agreed that 73721 was a good alternative reference code because the physician work for both codes is similar and the total physician times are the same, though the intra-service work of 73721 is slightly more intense. Based on the survey results and similarity to the reference code, the RUC agrees that the 25th percentile work RVU is appropriate. **Therefore, the RUC recommends the 25th percentile time and work RVU of 1.34 for CPT code 78454.**

1572

PLI

The RUC recommends that the PLI RVUS be cross-walked from the original base-codes: 78451 = 78464, 78452 = 78465, 78453 = 78460, and 78453 = 78461. The RUC also recommends that the PLI RVU for the technical component of each service be 0.00, and the PLI RVU be applied only to the physician component.

Practice Expense

The RUC reviewed the practice expense inputs approved by the PE Subcommittee and accepted them.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Myocardial perfusion and cardiac blood pool imaging studies may be performed at rest and/or during stress. When performed during exercise and/or pharmacologic stress, the appropriate stress testing code from the 93015-93018 series should be reported in addition to code(s) 78451- 78454 ~~78460-78465~~, 78472-78492.				

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:78451 Tracking Number Specialty Society Recommended RVU: **1.50**

Global Period: XXX RUC Recommended RVU: **1.40**

CPT Descriptor: Myocardial perfusion imaging, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old male with prior MI x2 and CHF has three-vessel disease by cath. A resting myocardial perfusion scan is ordered to assess viable tissue for possible CABG.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: The physician determines the appropriateness of the requested study; prescribes, oversees and directs the intravenously administered dose. The physician directs the technologist to adjust the acquisition protocol as necessary for the individual patient. If wall motion and/or ejection fraction are performed, the physician assesses the patient's cardiac rhythm, directs the technologist in lead placement for optimal gating signal and any necessary adjustments in gating acquisition parameters based on individual rhythm assessment. The physician is available to answer questions for the technologist and to review components of the study throughout the study.

Description of Intra-Service Work: The study consists of an acquisition of either a stress or a rest tomographic (SPECT) data set, synchronized (gated) to the patient's electrocardiogram when performed. The physician verifies the completeness and adequacy of the data before completion of the study and may order additional imaging if necessary.

The images are reviewed for artifacts and abnormal extracardiac distribution. Three different tomographic data sets are reviewed and re-reconstructed, if necessary. The physician compares the three tomographic views for differences similarities that would suggest ischemia or scar. Qualitative assessment of ventricular wall function and perfusion are made in a standardized manner, with each segment scored on a semi-quantitative scale when performed. Wall motion is qualitatively scored for motion and thickening. This occurs in a standardized segment model for the dataset with each segment scored as normal, mildly hypokinetic, moderately hypokinetic, severely hypokinetic, akinetic, or dyskinetic. Attention is paid to the assessment of regional myocardial function and to the percent of myocardium that is regionally

dysfunctional in order to judge the amount of underlying myocardial scar (or stress induced ischemia). The extent and severity of perfusion defects and their relationship to vascular geographic territories are noted.

When performed, wall motion and thickening quantitative data are generated and reviewed for the image set. The segmental wall motion data are compared to the perfusion images to generate a clinically relevant wall motion analysis for the individual patient. When performed, left ventricular ejection fraction is reported after confirming the correctness of the regions of interest that were selected for the calculation. Digital data of perfusion and ventricular function are reviewed after the qualitative assessment, in part to refine the qualitative impression. Comparison to relevant prior studies is done. A report is dictated for the medical record.

Description of Post-Service Work:
The physician reviews and signs the report for the medical record. The imaging results are discussed with the referring physician and may be discussed with the patient and family. The physician throughout the procedure provides regulatory review and oversight.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society of Nuclear Medicine, American College of Nuclear Physicians, American College of Cardiology, American College of Radiology and the American Society of Nuclear Cardiology convened a consensus expert panel to review the random sample data from the professional societies. The panel notes that this new code represents a combination of prior codes.

Survey Results

The panel noted that the survey median RVU was 1.50 with a 25th percentile of 1.36 and a 75th percentile of 1.84. The median value of 1.50 RVUs represents a significant decrease from the existing values (1.89 for the combined RVU of the three codes).

n developing a recommendation for 78451, our expert panel was concerned that the reference service list (RSL) could ıave been misleading to surveyees since the most frequently chosen reference code of 78459 is a tomographic metabolic-only PET code which does not include a further "half-study" evaluation of wall motion/ ejection fraction in its description or valuation. Recognizing the work intensity involved in the new code and the limitations and potential ambiguity of the current survey, the panel felt a recommendation of at least the 50 percentile value of 1.50 RVU was appropriate. The panel also noted that the approximate total time of the study by survey was not unreasonable. The differences from the RUC times in the database may reflect the respondents incorrectly allocating time into pre, intra and post service buckets, and the panel made adjustments to this allocation by time shifting pre and post into intra service time in its recommendation for consistency purposes.

Comparison to the Most Frequently Chosen Reference Code

The panel compared 78451 to the most frequently chosen reference code 78459 (RVU 1.50). Once again, it was noted 78459 describes a single session acquisition tomographic study in the PET family but without the added work of wall motion/ EF analysis and reporting. Respondents judged the intensity/complexity measures of the new code as the same or higher in 8/11 categories.

Comparison to "Similar Codes"

The panel notes that 78451 involves a tomographic imaging dataset with quantitative data with additional datasets of motion and functionality. This involves the gathering and interpretation of more clinical data than the single tomographic PET dataset acquisitions of 78459 and 78491 (both 1.50 RVU), albeit overseeing a SPECT radiopharmaceutical rather than a PET radiopharmaceutical. The panel believes this supports a recommendation of at least a value of 1.50 RVU.

Building Block Approach (within the perfusion family)

Single acquisition session SPECT with wall motion and EF (new CPT code 78451) is more complex than single and ıultiple planar imaging with WM/EF (new CPT code 78453 for single planar; new CPT code 78454 for multiple planar) ɔut less complex than multiple acquisition session SPECT with WM/EF (new CPT code 78452).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Single studies may be at rest or with stress. If performed with stress the appropriate stress code is billed separately in addition to the appropriate procedure code. It is common for multiple physicians to be involved in this procedure, cardiologists, radiologists and nuclear medicine physicians are the most common.

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Recommend CPT 78464; this code represents the current PLI for MPI inherent in 78451. The PLI RVU for the TC component should be 0.00.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:78452 Tracking Number Specialty Society Recommended RVU: **1.87**

Global Period: XXX RUC Recommended RVU: **1.75**

CPT Descriptor: Myocardial perfusion imaging, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male has hypertension, hyperlipidemia, and a family history of coronary artery disease. He has been experiencing atypical chest pain and advancing shortness of breath while walking. His resting electrocardiogram is abnormal, showing sinus rhythm, possible inferior wall MI and non-specific ST-T wave abnormalities. He is referred for a stress and rest myocardial perfusion study with wall motion and ejection fraction evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: The physician determines the appropriateness of the requested study; prescribes, oversees and directs the intravenously administered dose. The physician directs the technologist to adjust the acquisition protocol as necessary for the individual patient. If wall motion and/or ejection fraction are performed, the physician assesses the patient's cardiac rhythm, directs the technologist in lead placement for optimal gating signal and any necessary adjustments in gating acquisition parameters based on individual rhythm assessment. The physician is available to answer questions for the technologist and to review components of the study throughout the study.

Description of Intra-Service Work: The study consists of acquisition of a stress and a rest (and/or redistribution) tomographic (SPECT) data sets, synchronized (gated) to the patient's electrocardiogram when performed. The physician verifies the completeness and adequacy of the data sets before completion of the study and may ord additional imaging if necessary.

The images are reviewed for artifacts and abnormal extracardiac distribution. Three different tomographic datasets are reviewed for each acquisition, and re-reconstructed, if necessary. The physician compares the tomographic datasets for differences or similarities that would suggest ischemia or scar. Qualitative assessment of ventricular wall function and

perfusion are made in a standardized manner, with each segment scored on a semi-quantitative scale when performed. Wall motion is qualitatively scored for motion and thickening. This occurs in a standardized segment model for the dataset with each segment scored as normal, mildly hypokinetic, moderately hypokinetic, severely hypokinetic, akinetic, or dyskinetic. Attention is paid to the assessment of regional myocardial function and to the percent of myocardium that is regionally dysfunctional in order to judge the amount of underlying myocardial scar (or stress induced ischemia). The extent and severity of perfusion defects and their relationship to vascular geographic territories are noted.

When performed, wall motion and thickening quantitative data are generated and reviewed. The segmental wall motion data are compared to the perfusion images to generate a clinically relevant wall motion analysis for the individual patient. When performed, left ventricular ejection fraction is noted after confirming the correctness of the regions of interest that were selected for the calculation. Digital data of perfusion and ventricular function are reviewed after the qualitative assessment, in part to refine the qualitative impression. Comparison to relevant prior studies is done. A report is dictated for the medical record.

Description of Post-Service Work: The physician reviews and signs the report for the medical record. The imaging results are discussed with the referring physician and may be discussed with the patient and family. The physician throughout the procedure provides regulatory review and oversight.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Valu Recommendations for the appropriate formula and format.*

The Society of Nuclear Medicine, American College of Nuclear Physicians, American College of Cardiology, American College of Radiology and the American Society of Nuclear Cardiology convened a consensus expert panel to review the random sample AMA RUC survey summary data from the professional societies. The panel notes that this new code represents a combination of three previous codes just recently surveyed for the 2005 Five Year Review (a 2005 survey more robust in 125 respondents).

Survey Results

The panel noted that the survey median RVU was 1.87 with a 75th percentile of 2.00 and a 25th percentile of 1.58. This median value of 1.87 RVUs represents a significant decrease from the existing values (2.26 for the combined RVU of the three codes). The existing values reflect the RUC recommendations from the most recent Five Year Review, which involved data from 125 surveys and extensive analysis by the RUC, which specifically took into account that the services were almost always performed in combination.

In developing a recommendation for 78452, our expert panel was concerned that the RSL could have been misleading to surveyees since the most frequently chosen reference code of 78492 is a multiple imaging session tomographic PET "perfusion-only" code which does not include a further "half study" evaluation of wall motion or ejection fraction in its description or valuation. Recognizing the work intensity involved in the new code and the limitations and potential ambiguity of the current survey, the panel felt a recommendation of at least the 50th percentile value of 1.87 RVU was appropriate. The panel also noted that the approximate total time by survey of the new code was overall consistent with the combination of the 2005 consensus results. The differences from the RUC times in the database may reflect the respondents incorrectly allocating time into pre, intra and post service buckets, and the panel made adjustments to this allocation by time shifting pre and post into intra service time in its recommendation for consistency purposes.

Comparison to Most Frequently Chosen Code

The panel compared 78452 to the most frequently chosen reference code 78492. Once again, it was noted that this is a code of multiple imaging session tomographic PET "perfusion only" but without the added work of wall motion/ejection fraction analysis and reporting. Respondents judged the intensity/complexity measures of the new code as significantly higher (6) or about the same (3) in 9/11 categories.

Comparison to "Similar Codes"

The panel notes that 78452 involves the comparison of multiple session tomographic imaging datasets with multiple quantification data in addition to datasets of motion, functionality and attenuation correction. It also involves the mandated NRC radiation safety compliance oversight associated with multiple imaging sessions. It should entail more work on an estimation of magnitude than the interpretation of single session tomographic imaging datasets (especially without further motion datasets), such as 78491 (single session PET perfusion only – 1.50 RVU). The panel believes that 784X2 is at least similar in physicians work to 78812 (PET skull to thigh – 1.93 RVU) and 71275 (CT Angiogiography Chest – 1.92 RVU).

Building Block Approach (within perfusion family)

Multiple imaging session SPECT with WM/EF (new CPT code 78452) is more intensity and work than single session acquisition (new CPT code 78451). SPECT is more datasets and complexity than planar imaging (new CPT code 78453, for single planar; new CPT code 78454, for multiple planar). As such, 78452 is among the most complex nuclear cardiology/ nuclear medicine codes. Multiple image SPECT Perfusion has always been about 0.40 RVU greater than single session SPECT.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Multiple studies may be at rest, with stress or redistribution. If performed with stress the appropriate stress code is billed separately in addition to the appropriate procedure code. It is common for multiple physicians to be involved in this procedure, cardiologists, radiologists and nuclear medicine physicians are the most common.

SUMMARY OF RECOMMENDATION

CPT Code:78453 Tracking Number Specialty Society Recommended RVU: **1.00**

Global Period: XXX RUC Recommended RVU: **1.00**

CPT Descriptor: Myocardial perfusion imaging, planar (including qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 63- year-old female with hypertension and hypercholesterolemia has been experiencing chest discomfort and shortness of breath. She has significant arthritis of her upper extremities and back and difficulty with positioning when lying down. Resting electrocardiogram shows sinus rhythm and non-specific ST-T wave abnormalities. She is referred for stress myocardial perfusion study, which if completely normal will not require a rest study.

Percentage of Survey Respondents who found Vignette to be Typical: 69%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 4%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 4%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: The physician determines the appropriateness of the requested study; prescribes, oversees and directs the intravenously administered dose. The physician directs the technologist to adjust the acquisition protocol as necessary for the individual patient. If wall motion and/or ejection fraction are performed, the physician assesses the patient's cardiac rhythm, directs the technologist in lead placement for optimal gating signal and any necessary adjustments in gating acquisition parameters based on individual rhythm assessment. The physician is available to answer questions for the technologist and to review components of the study throughout the study.

Description of Intra-Service Work: The study consists of a single study acquisition of either a stress or rest set of planar images, synchronized (gated) to the patient's electrocardiogram when performed. The physician verifies the completeness and adequacy of the data before completion of the study and may order additional imaging if necessary.

The planar images are reviewed for artifacts and abnormal extracardiac distribution. The cardiac images, that are acquired in at least three different projections (e.g. anterior, LAO and lateral), are reviewed. The physician compares the acquisition datasets for differences or similarities that would suggest ischemia or scar. Qualitative assessment of myocardial perfusion is made in a standardized manner, with each segment scored on a semi-quantitative scale.

Qualitative assessment of left ventricular global function is made, when performed. Wall motion is qualitatively scored for motion and thickening, when performed. This occurs in a standardized segment model for each dataset with each segment scored as normal, mildly hypokinetic, moderately hypokinetic, severely hypokinetic, akinetic, or dyskinetic. Attention is paid to the assessment of regional myocardial function and to the percent of myocardium that is regionally dysfunctional in order to judge the amount of underlying myocardial scar (or stress induced ischemia). The extent and severity of perfusion defects and their relationship to vascular geographic territories are noted.

When performed, wall motion and thickening quantitative data are generated and reviewed for the image set. The segmental wall motion data are compared to the perfusion images to generate a clinically relevant wall motion analysis for the individual patient. When performed, the left ventricular ejection fraction is noted after confirming the correctness of the regions of interest that were selected for the calculation. Digital data of perfusion and ventricular function are reviewed after the qualitative assessment, in part to refine the qualitative impression. Comparison to relevant prior studies is done. A report is dictated for the medical record.

Description of Post-Service Work: The physician reviews and signs the report for the medical record. The imaging results are discussed with the referring physician and may be discussed with the patient and family. The physician throughout the procedure provides regulatory review and oversight.

Post-Service intensity/complexity	3.04	3.04

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Society of Nuclear Medicine, American College of Nuclear Physicians, American College of Cardiology, American College of Radiology and the Society of Nuclear Cardiology convened a consensus expert panel to review the random sample AMA RUC survey summary data from the professional societies. The panel notes this code represents a combination of previous codes.

Survey Results

The panel notes that the median survey RVU was 1.35 with a 75th percentile of 1.50 and a 25th percentile of 1.00. While the median is a slight decrease from the previous work of planar imaging plus assessment of wall motion and ejection fraction (WM/EF) (1.66 for the combined RVU of the 3 codes), in this new code, the panel expressed concern that the median value created "relative work rank order anomalies" with the surveyed family of codes for SPECT perfusion with WM/EF. The reference code was more reflective of simpler single session planar imaging (although intensities were judged higher). As such, the panel felt a recommendation of the 25th percentile of 1.00 was most appropriate.

Comparison to the Most Frequently Chosen Code

The panel compared 78453 to the most frequently chosen reference code 78472. 78472 is a robust planar method to obtain cardiac ventricular function and especially left ventricular wall motion and ejection fraction but provides no myocardial perfusion information. Respondents felt intensity/complexity of 78453 was greater than 78472, as well. Despite this, the panel felt that 78453 was in the category of the other similar codes in this work/intensity range and should serve as the starting building block for the planar and SPECT myocardial perfusion family. As such, a recommendation of 1.00 (25th percentile) appeared most accurate.

Comparison to Similar Codes

Single session planar bone imaging, 78306 – RVU 0.86 – has similar times and acquisition parameters but is without acquisition and interpretation of additional organ/system functional datasets (such as WM/EF). Three Phase bone imaging, 78315 – RVU 1.02 – has similar times and some additional simple temporal acquisition of "functionality". The panel felt this supported a recommendation of 1.00 for 78453.

Building Block Approach (within perfusion family)

Single session (rest or stress) planar imaging with WM/EF (new CPT code 78453, proposed RVU of 1.00) is the least complex of this new myocardial perfusion family. Multiple (rest and stress) planar imaging with WM/EF (new CPT code 78454) is more work and complexity, single session perfusion SPECT with wall motion/EF (new CPT code 78451) requires yet more effort and is of greater complexity that the previous two studies, and the most complex and requiring the greatest work is multiple session SPECT perfusion imaging with WM/EF (new CPT code 78452). The amount of work in 78453 is still at least as much work and complexity as other similar planar nuclear medicine codes, and the panel felt this supported a recommendation of 1.00 RVU.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Single studies may be at rest or with stress. If performed with stress the appropriate stress code is billed separately in addition to the appropriate procedure code. It is common for multiple physicians to be involved in this procedure, cardiologists, radiologists and nuclear medicine physicians are the most common.

Time Segments (Mean)

Pre-Service intensity/complexity	3.46	3.31
Intra-Service intensity/complexity	4.25	4.08
Post-Service intensity/complexity	3.23	3.16

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Val: Recommendations for the appropriate formula and format.*

The Society of Nuclear Medicine, American College of Nuclear Physicians, American College of Cardiology, American College of Radiology and the American Society of Nuclear Cardiology convened a consensus expert panel to review the random sample AMA RUC survey summary from the professional societies. The panel notes that the new code represents a combination of codes.

Survey results:

The panel notes that the median RVU of the survey was 1.50 with a 75th percentile of 1.87 and a 25th percentile of 1.34. While the median is a slight decrease from the previous work of planar imaging plus assessment of wall motion and ejection fraction (WM/EF) (2.03 for the combined RVU of the three codes) in this new code, the panel expressed concern that the median value could create "relative work rank order anomalies" with the SPECT perfusion codes with WM/EF. The reference code was more reflective of simpler (but multiple session) planar imaging. As such, the panel felt a recommendation of the 25th percentile of 1.34 was most appropriate.

Comparison to Most Frequently Chosen Code.

The panel compared 78454 with the most frequently chosen reference code of 78473 – RVU 1.47. 78473 is a planar study, consisting of multiple (rest/stress) acquisition datasets to obtain cardiac ventricular function and especially left ventricular wall motion/ejection fraction (essentially multiple 78472's) but yields no myocardial perfusion information. Respondents felt the intensity/complexity of 78454 was greater than 78473, as well. Despite this, the panel felt that 78454 was in the category of other similar multiple planar nuclear medicine codes and less than the work involved in single acquisition SPECT with EF/WM, the next code in the myocardial perfusion family of codes. As such, a recommendation of the 25th percentile of 1.34 appeared accurate.

Comparison to "Similar Codes"

CPT 78707, multiple session planar renal imaging with vascular flow/function, has some comparability in work and complexity to 78454. It has an RVU value of 1.41. In comparison to CPT 78707, the panel felt that a recommendation of 1.34 RVU at the 25 percentile was rational.

Building Block Approach (within perfusion family)

Multiple session (stress and rest) planar perfusion imaging with EF/WM (new CPT code 78454, proposed RVU of 1.34) is more work and complexity than single session planar perfusion imaging with EF/WM (new CPT code 78453, proposed RVU of 1.00). The service is less work and complexity than the SPECT myocardial perfusion studies (new CPT code 78451for single SPECT; new CPT code 78452, for multiple SPECT). The difference between the single planar and multiple planar perfusion studies has traditionally been about 0.40 RVU, suggesting a recommendation of at least 1.34 RVU is rational.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Multiple studies may be at rest, with stress or redistribution. If performed with stress the appropriate stress code is billed separately in addition to the appropriate procedure code. It is common for multiple physicians to be involved in this procedure, cardiologists, radiologists and nuclear medicine physicians are the most common. Table 1

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Radiology How often? Commonly

Specialty Nuclear Medicine How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 48000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. See 2006 breakdown noted above.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
;pecialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2006 CMS data base. See breakdown noted above.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Recommend CPT 78461; this code represents the current PLI for MPI inherent in 78454. The PLI RVU for the TC component should be 0.00

ndicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: Myocardial perfusion imaging, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The five societies performing this service, the American College of Cardiology (ACC), the American College of Nuclear Physicians (ACNP), the American College of Radiology (ACR), the American Society of Nuclear Cardiology (ASNC), and the Society of Nuclear Medicine (SNM) utilized current AMA and CMS PE approved inputs to develop the direct practice expense recommendations for code 78451. We then compared the inputs to surveys from society members and consensus panel to further develop the practice expense recommendations. Attention was paid to the geographic distribution and practice type (private practice) for the input from society member and consensus panel. A joint consensus between ACC, ACNP, ACR, ASNC and SNM was reached for the final practice expense recommendation for this code. Input from the specialty society members was used to establish current techniques and the common service times for various work elements that were provided to the consensus committee.

Finally, we note that since this service may be accompanied by a stress test (either exercise or pharmacologic) that is billed separately. Thus, all resources associated with the stress test have been excluded.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The nuclear medicine technologist (NMT) confirms the test order with the physician regarding technique and radiopharmaceutical to be used, making any necessary changes from the usual protocol based upon the patient's particular history and/or present condition. The NMT at the direction of the physician orders, receives the package containing radioactive material performing a radiation survey for radioactive contamination, organizes and prepares the radiopharmaceutical for administration to the patient. The NMT prepares the room, equipment and collimation for the patient imaging study.

The NMT performs a daily camera assessment including daily floods, recalibration, energy peak check for different isotopes used for this procedure; weekly/monthly/quarterly assessment of camera uniformity, center of rotation and resolution studies to include periodic maintenance as dictated by the test performed on the nuclear medicine camera and computer in preparation for quality tomographic nuclear medicine imaging.

Intra-Service Clinical Labor Activities:

Before beginning the procedure, the NMT reviews the indicated procedure and the radiation risks with the patient, answering the patient's questions. The NMT obtains the patient's history evaluating contraindications such as pregnancy or claustrophobia. The NMT prepares the patient with proper insertion of the IV, stopcock and extension tubing; when gating is performed, ECG electrodes are applied, insuring good contact and a reliable computer signal for gating or triggering. Electrodes are re-arranged for optimal signal. Suitability of gating or triggering is assessed. The NMT assays the patient radiopharmaceutical dose, recording the dose in appropriate NRC records, patient medical records and computer procedure protocols. When performed the NMT stands by during the stress/exercise procedure to inject the radiopharmaceutical (at the direction of the supervising physician or qualified designate) at near peak stress. Exercise is continued for at least one minute post-injection. Termination of stress/exercise is individual patient-specific and at the direction of the supervising physician or qualified designate.

The NMT positions the patient on the nuclear medicine imaging table, positions the camera defining the circuit of motion of camera around the patient, defines computer acquisition parameters and acquires the required diagnostic imaging set. When performed the camera is set up to collect attenuation correction images utilizing computed tomography or gadolinium rods. The NMT monitors the patient during acquisition for possible motion, comfort, and clinical safety. The NMT inspects the imaging set to ensure accurate positioning and placement in addition to appropriate target to background organ isolation before the procedure is completed. The quality of functional ECG gated imaging is assessed and adjustments/reacquisition performed as necessary.

The NMT then quantitatively processes all acquired imaging data for review by the interpreting physician, including qualitative and quantitative data (both pre and post attenuation data sets). The raw perfusion images are processed separately from the attenuation correction images, when

performed. The gated SPECT study is processed separately from the perfusion images. Regions of interest are established for ejection fraction calculations. Any pertinent anomalies that occurred during the procedure are noted and reviewed later with the reading physician.

Upon completion of imaging, the NMT removes the patient IV and dismisses the patient with after-care instructions and any additional education regarding radiation safety in the home and general public environment. The dismissal instructions must include counseling on precautions to reduce radiation exposure to the public, friends, and family members.

The NMT cleans all rooms utilized during the procedure, including the injection area, stress and scan rooms. The NM appropriately stores and disposes of all radioactive contaminated materials, including syringes, needles, IV sets, disposable peripheral materials (such as bed linens, clothing, gauze, tapes, and chux padding) following Nuclear Regulatory Commission guidelines and regulations. The NMT archives each new patient data set.

Post-Service Clinical Labor Activities:

The NMT displays the images for the interpreting physician's review including placing on the physician's view box or reading station, printing images, retrieving and displaying prior studies and obtaining archived data on other related procedures and/or laboratory results.

The NMT completes all nuclear regulatory compliance procedures as related to this technology such as daily wipe testing with radiation counting of each wipe, radiation monitoring of the hot lab, camera room and stress testing areas; personal hand and foot monitoring; disposing of biohazard of all appropriately decayed radiation supplies defacing labels when appropriate; assessing constancy of the dose calibrator, allocation and discussing results with appropriate staff members. Each radiation compliance action requires documentation and recording of the given task as per the Nuclear Regulatory Commission guidelines and regulations.

See Attached Spreadsheet for Clinical Labor, Medical Supplies, and Medical Equipment.

Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: Myocardial perfusion imaging, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The five societies performing this service, the American College of Cardiology (ACC), the American College of Nuclear Physicians (ACNP), the American College of Radiology (ACR), the American Society of Nuclear Cardiology (ASNC), and the Society of Nuclear Medicine (SNM) utilized current AMA and CMS PE approved inputs to develop the direct practice expense recommendations for code 78452. We then compared the inputs to surveys from society members and consensus panel to further develop the practice expense recommendations. Attention was paid to the geographic distribution and practice type (private practice) for the input from society member and consensus panel. A joint consensus between ACC, ACNP, ACR, ASNC and SNM was reached for the final practice expense recommendation for this code. Input from the specialty society members was used to establish current techniques and the common service times for various work elements that were provided to the consensus committee.

Finally, we note that since this service may be accompanied by a stress test (either exercise or pharmacologic) that is billed separately. Thus, all resources associated with the stress test have been excluded.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The nuclear medicine technologist (NMT) confirms the test order with the physician regarding technique and radiopharmaceutical to be used, making any necessary changes from the usual protocol based upon the patient's particular history and/or present condition. The NMT at the direction of the physician orders, receives the package containing radioactive material performing a radiation survey for radioactive contamination, organizes and prepares the radiopharmaceutical for administration to the patient. The NMT prepares the room, equipment and collimation for the patient imaging study.

The NMT performs a daily camera assessment including daily floods, recalibration, energy peak check for different isotopes used for this procedure; weekly/monthly/quarterly assessment of camera uniformity, center of rotation and resolution studies to include periodic maintenance as dictated by the test performed on the nuclear medicine camera and computer in preparation for quality tomographic nuclear medicine imaging.

Intra-Service Clinical Labor Activities:

Before beginning the procedure, the NMT reviews the indicated procedure and the radiation risks with the patient, answering the patient's questions. The NMT obtains the patient's history evaluating contraindications such as pregnancy or claustrophobia. The NMT prepares the patient with proper insertion of the IV, stopcock and extension tubing; when gating is performed, ECG electrodes are applied, insuring good contact and a reliable computer signal for gating or triggering. Electrodes are re-arranged for optimal signal. Suitability of gating or triggering is assessed. The NMT assays the patient radiopharmaceutical dose, recording the dose in appropriate NRC records, patient medical records and computer procedure protocols. When performed the NMT stands by during the stress/exercise procedure to inject the radiopharmaceutical (at the direction of the supervising physician or qualified designate) at near peak stress. Exercise is continued for at least one minute post-injection. Termination of stress/exercise is individual patient-specific and at the direction of the supervising physician or qualified designate.

The NMT positions the patient on the nuclear medicine imaging table, positions the camera defining the circuit of motion of camera around the patient, defines computer acquisition parameters and acquires the required diagnostic imaging set. When performed the camera is set up to collect attenuation correction images utilizing computed tomography or gadolinium rods. The NMT monitors the patient during acquisition for possible motion, comfort, and clinical safety. The NMT inspects the imaging set to ensure accurate positioning and placement in addition to appropriate target to background organ isolation before the procedure is completed. The quality of functional ECG gated imaging is assessed and adjustments/reacquisition performed as necessary.

The NMT then quantitatively processes all acquired imaging data for review by the interpreting physician, including qualitative and quantitative data (both pre and post attenuation data sets). The raw perfusion images are processed separately from the attenuation correction images, when performed. The gated SPECT study is processed separately from the perfusion images. Regions of interest are established for ejection fraction calculations. Any pertinent anomalies that occurred during the procedure are noted and reviewed later with the reading physician.

Upon completion of the first diagnostic imaging set (in this case the stress procedure) the patient is given instructions regarding the second diagnostic rest imaging set and also instructed on the appropriate time to return for completion of the procedure. The patient's activity and diet restrictions are reviewed in detail if radiopharmaceutical and protocol stipulates. All questions regarding radiation safety are again answered before patient's departure.
The NMT cleans all rooms utilized during the procedure, including the injection area, stress and scan rooms. The NM appropriately stores and disposes of all radioactive contaminated materials, including syringes, needles, IV sets, disposable peripheral materials (such as bed linens, clothing, gauze, tapes, and chux padding) following Nuclear Regulatory Commission guidelines and regulations.

Upon returning for the second resting diagnostic imaging set, the NMT again prepares, assays, records and delivers the prescribed radiopharmaceutical when appropriate following physician approved protocol. If a second injection of a radiopharmaceutical occurs, administration is via the patient IV setup from the initial procedure. IV is first tested and flushed to ensure patency. The patient is again positioned and imaged by the NMT, repeating the same positioning and

placement as the initial acquisition. The patient is again monitored carefully for optimal image acquisition. The second (rest or redistribution) diagnostic imaging set is inspected.

Upon completion of this second set of imaging, the NMT removes the patient's IV and dismisses the patient with after-care instructions and any additional education regarding radiation safety in the home and general public environment. The dismissal instructions must include answering any questions on precautions to reduce radiation exposure to the public, friends, and family members

This second set of image acquisition and processing is completed as noted previously for the initial image set.

The room must again be cleaned prior to the next patient procedure, removing and disposing any patient-specific materials in preparation as noted in the first image set following Nuclear Regulatory Commission guidelines and regulations. The NMT archives each new patient data set.

Post-Service Clinical Labor Activities:

The NMT displays the images for the interpreting physician's review including placing on the physician's view box or reading station, printing images, retrieving and displaying prior studies and obtaining archived data on other related procedures and/or laboratory results.

The NMT completes all nuclear regulatory compliance procedures as related to this technology such as daily wipe testing with radiation counting of each wipe, radiation monitoring of the hot lab, camera room and stress testing areas; personal hand and foot monitoring; disposing of biohazard of all appropriately decayed radiation supplies defacing labels when appropriate; assessing constancy of the dose calibrator, allocation and discussing results with appropriate staff members. Each radiation compliance action requires documentation and recording of the given task as per the Nuclear Regulatory Commission guidelines and regulations.

See Attached Spreadsheet for Clinical Labor, Medical Supplies, and Medical Equipment.

XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: Myocardial perfusion imaging, planar (including qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The five societies performing this service, the American College of Cardiology (ACC), the American College of Nuclear Physicians (ACNP), the American College of Radiology (ACR), the American Society of Nuclear Cardiology (ASNC), and the Society of Nuclear Medicine (SNM) utilized current AMA and CMS PE approved inputs to develop the direct practice expense recommendations for code 78453. We then compared the inputs to surveys from society members and consensus panel to further develop the practice expense recommendations. Attention was paid to the geographic distribution and practice type (private practice) for the input from society member and consensus panel. A joint consensus between ACC, ACNP, ACR, ASNC and SNM was reached for the final practice expense recommendation for this code. Input from the specialty society members was used to establish current techniques and the common service times for various work elements that were provided to the consensus committee.

Finally, we note that since this service may be accompanied by a stress test (either exercise or pharmacologic) that is billed separately. Thus, all resources associated with the stress test have been excluded.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The nuclear medicine technologist (NMT) confirms the test order with the physician regarding technique and radiopharmaceutical to be used, making any necessary changes from the usual protocol based upon the patient's particular history and/or present condition. The NMT at the direction of the physician orders, receives the package containing radioactive material performing a radiation survey for radioactive contamination, organizes and prepares the radiopharmaceutical for administration to the patient. The NMT prepares the room, equipment and collimation for the patient imaging study. The NMT performs a daily camera assessment including daily floods, recalibration, energy peak check for isotopes used for this procedure; and weekly/monthly/quarterly assessment of camera uniformity and resolution studies to include periodic maintenance as dictated by the test performed on the nuclear medicine camera and computer in preparation for quality planar nuclear medicine imaging.

Intra-Service Clinical Labor Activities:

Before beginning the procedure, the NMT reviews the indicated procedure and the radiation risks with the patient, answering the patient's questions. The NMT obtains the patient's history evaluating contraindications such as pregnancy or claustrophobia. The NMT prepares the patient with proper insertion of the IV, stopcock and extension tubing; when gating is performed, ECG electrodes are applied, insuring good contact and a reliable computer signal for gating or triggering. Electrodes are re-arranged for optimal signal. Suitability of gating or triggering is assessed. The NMT assays the patient radiopharmaceutical dose, recording the dose in appropriate NRC records, patient medical records and computer procedure protocols. When performed the NMT stands by during the stress/exercise procedure to inject the radiopharmaceutical (at the direction of the supervising physician or qualified designate) at near peak stress. Exercise is continued for at least one minute post-injection. Termination of stress/exercise is individual patient-specific and at the direction of the supervising physician or qualified designate.

The NMT positions the patient on the nuclear medicine imaging table, positions the camera and acquires a minimum of three planar images (e.g. anterior, LAO and lateral). The NMT monitors the patient during acquisition for possible motion, comfort, and clinical safety. The NMT inspects the imaging set to ensure accurate positioning and placement in addition to appropriate target to background organ isolation before the procedure is completed. The quality of functional ECG gated imaging is assessed and adjustments/reacquisition performed as necessary. Regions of interest are established for ejection fraction calculations when performed. Any pertinent anomalies that occurred during the procedure are noted and reviewed later with the reading physician.

Upon completion of imaging, the NMT removes the patient IV and dismisses the patient with after-care instructions and any additional education regarding radiation safety in the home and general public environment. The dismissal instructions must include counseling on precautions to reduce radiation exposure to the public, friends, and family members.

The NMT cleans all rooms utilized during the procedure including the injection area, stress and scan rooms. The NM appropriately stores and disposes of all radioactive contaminated materials, including syringes, needles, IV sets, disposable peripheral materials (such as bed linens, clothing, gauze, tapes, and chux padding) following Nuclear Regulatory Commission guidelines and regulations. The NMT archives each new patient data set.

Post-Service Clinical Labor Activities:

The NMT displays the images for the interpreting physician's review including placing on the physician's view box or reading station, printing images, retrieving and displaying prior studies and obtaining archived data on other related procedures and/or laboratory results.

The NMT completes all nuclear regulatory compliance procedures as related to this technology such as daily wipe testing with radiation counting of each wipe, radiation monitoring of the hot lab, camera room and stress testing areas; personal hand and foot monitoring; disposing of biohazard of all appropriately decayed radiation supplies defacing labels when appropriate; assessing constancy of the dose calibrator, allocation and discussing results with appropriate staff members. Each radiation compliance action requires documentation and recording of the given task as per the Nuclear Regulatory Commission guidelines and regulations.

See Attached Spreadsheet for Clinical Labor, Medical Supplies, and Medical Equipment.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: Myocardial perfusion imaging, planar (including qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The five societies performing this service, the American College of Cardiology (ACC), the American College of Nuclear Physicians (ACNP), the American College of Radiology (ACR), the American Society of Nuclear Cardiology (ASNC), and the Society of Nuclear Medicine (SNM) utilized current AMA and CMS PE approved inputs to develop the direct practice expense recommendations for code 78454. We then compared the inputs to surveys from society members and consensus panel to further develop the practice expense recommendations. Attention was paid to the geographic distribution and practice type (private practice) for the input from society member and consensus panel. A joint consensus between ACC, ACNP, ACR, ASNC and SNM was reached for the final practice expense recommendation for this code. Input from the specialty society members was used to establish current techniques and the common service times for various work elements that were provided to the consensus committee.

Finally, we note that since this service may be accompanied by a stress test (either exercise or pharmacologic) that is billed separately. Thus, all resources associated with the stress test have been excluded.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The nuclear medicine technologist (NMT) confirms the test order with the physician regarding technique and radiopharmaceutical to be used, making any necessary changes from the usual protocol based upon the patient's particular history and/or present condition. The NMT at the direction of the physician orders, receives the package containing radioactive material performing a radiation survey for radioactive contamination, organizes and prepares the radiopharmaceutical for administration to the patient. The NMT prepares the room, equipment and collimation for the patient imaging study. The NMT performs a daily camera assessment including daily floods, recalibration, energy peak check for isotopes used for this procedure; and weekly/monthly/quarterly assessment of camera uniformity and resolution studies to include periodic maintenance as dictated by the test performed on the nuclear medicine camera and computer in preparation for quality planar nuclear medicine imaging.

Intra-Service Clinical Labor Activities:

Before beginning the first procedure, the NMT reviews the indicated procedure and the radiation risks with the patient, answering the patient's questions. The NMT obtains the patient's history evaluating contraindications such as pregnancy or claustrophobia. The NMT prepares the patient with proper insertion of the IV, stopcock and extension tubing; when gating is performed, ECG electrodes are applied, insuring good contact and a reliable computer signal for gating or triggering. Electrodes are re-arranged for optimal signal. Suitability of gating or triggering is assessed. The NMT assays the patient radiopharmaceutical dose, recording the dose in appropriate NRC records, patient medical records and computer procedure protocols. When performed the NMT stands by during the stress/exercise procedure to inject the radiopharmaceutical (at the direction of the supervising physician or qualified designate) at near peak stress. Exercise is continued for at least one minute post-injection. Termination of stress/exercise is individual patient-specific and at the direction of the supervising physician or qualified designate.

The NMT positions the patient on the nuclear medicine imaging table, positions the camera and acquires a minimum of three planar images (e.g. anterior, LAO and lateral). The NMT monitors the patient during acquisition for possible motion, comfort, and clinical safety. The NMT inspects the imaging set to ensure accurate positioning and placement in addition to appropriate target to background organ isolation before the procedure is completed. The quality of functional ECG gated imaging is assessed and adjustments/reacquisition performed as necessary. Regions of interest are established for ejection fraction calculations when performed. Any pertinent anomalies that occurred during the procedure are noted and reviewed later with the reading physician.

Upon completion of the first diagnostic imaging set (in this case the stress procedure) the patient is given instructions regarding the second diagnostic rest imaging set and also instructed on the appropriate time to return for completion of the procedure. The patient's activity and diet restrictions are reviewed in detail if radiopharmaceutical and protocol stipulates. All questions

regarding radiation safety are again answered before patient's departure. The NMT cleans all rooms utilized during the procedure, including the injection area, stress and scan rooms. The NM appropriately stores and disposes of all radioactive contaminated materials, including syringes, needles, IV sets, disposable peripheral materials (such as bed linens, clothing, gauze, tapes, and chux padding) following Nuclear Regulatory Commission guidelines and regulations.

Upon return of the patient for the second resting diagnostic imaging set, the NMT again prepares, assays, records and delivers the prescribed radiopharmaceutical, when appropriate, following physician approved protocol. If a second injection of a radiopharmaceutical is ordered, administration is via the patient IV setup from the initial procedure. IV is first tested and flushed to ensure patency. The patient is again positioned and imaged by the NMT, repeating the same positioning and placement as the initial acquisition. The patient is again monitored carefully for optimal image acquisition. The second (rest or redistribution) diagnostic imaging set is inspected. The image acquisition and processing is completed as noted previously. The room must again be cleaned, removing and disposing any patient-specific materials in preparation as noted in the first image set, prior to the next patient procedure. The NMT archives each new patient data set.

Upon completion of imaging, the NMT removes the patient IV and dismisses the patient with after-care instructions and any additional education regarding radiation safety in the home and general public environment. The dismissal instructions must include counseling on precautions to reduce radiation exposure to the public, friends, and family members.

Post-Service Clinical Labor Activities:

The NMT displays the images (stress and rest or redistribution) for the interpreting physician's review including placing on the physician's view box or reading station, printing images, retrieving and displaying prior studies and obtaining archived data on other related procedures and/or laboratory results.

The NMT completes all nuclear regulatory compliance procedures as related to this technology such as daily wipe testing with radiation counting of each wipe, radiation monitoring of the hot lab, camera room and stress testing areas; personal hand and foot monitoring; disposing of biohazard of all appropriately decayed radiation supplies defacing labels when appropriate; assessing constancy of the dose calibrator, allocation and discussing results with appropriate staff members. Each radiation compliance action requires documentation and recording of the given task as per the Nuclear Regulatory Commission guidelines and regulations.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from Five-Year Review

April 2009

Bundled Audiology Tests

In February 2008, the RUC identified 92541, 92542, 92544, 92545, 92567, 92568, and 92569 through the Codes Reported Together screen as several pairings of these services are reported together more than 95% of the time. The RUC referred these codes to CPT for creation of new bundled services and to reorganize the coding structure to reflect the typical procedures performed.

92540
The RUC reviewed code 92540 *Basic vestibular evaluation, includes spontaneous nystagmus test with eccentric gaze fixation nystagmus, with recording, positional nystagmus test, minimum of 4 positions, with recording, optokinetic nystagmus test, bidirectional foveal and peripheral stimulation, with recording, and oscillating tracking test, with recording* which bundles codes 92541, 92542, 92544 and 92545. Since the proposed RVUs were higher than the bundling of these four services the specialty societies were required to present compelling evidence. The RUC agreed that there was compelling evidence to warrant a higher work RVU because these services had never been RUC surveyed and audiologists' had not been included in the original Harvard study.

1626

The RUC reviewed the survey results for 92540 comprised of 66 respondents, (51 Audiologists, 10 Otolaryngologists and 5 Neurologists). The RUC compared 92540 to reference service *92557 Comprehensive audiometry threshold evaluation and speech recognition* (work RVU = 0.60, 20 minutes intra-service) and agreed that 92540 is more than double the physician work and time than 92557. The RUC determined that the 60 minutes intra-service time for 92540 is appropriate as the health care provider performs a battery of four successive procedures, evaluation for spontaneous nystagmus, positional nystagmus testing, optokineticnystagmus testing and oscillating tracking. The RUC determined that 10 minutes of immediate post-service time is required to explain results from a functional and physiological perspective to a referring physician and the patient. The RUC agreed with the specialty society recommended physician times of pre-service time package 5 – Non-Facility Procedure without sedation/anesthesia 7 minutes, 60 minutes intra-service time and 10 minutes immediate post-service time. The RUC agreed with the survey median work RVU of 1.50, as it is representative of the audiologists' survey responses, who are the primary providers of this service. The recommended work RVU of 1.50 places this service in the proper rank order with other services provided by audiologists, as well as similar services provided by other health care professionals. For additional support the RUC compared 92540 to HCPAC MPC codes 97001 *Physical therapy evaluation* (work RVU = 1.20) and 90806 *Individual psychotherapy, insight oriented, behavior modifying and/or supportive, in an office or outpatient facility,*

approximately 45 to 50 minutes face-to-face with the patient (work RVU = 1.86). **The RUC recommends a work RVU of 1.50 for 92540.**

92570

The RUC reviewed code 92570 *Acoustic immittance testing, includes tympanometry (impedance testing), acoustic reflex threshold testing, and acoustic reflex decay testing* which bundles codes 92567, 92568 and 92569. The specialty societies recommended a work RVU lower than these three combined services.

The RUC reviewed the survey results for 92570 in which 92 Audiologists and 6 Otolaryngologists responded. The RUC compared 92570 to reference service *92557 Comprehensive audiometry threshold evaluation and speech recognition* (work RVU = 0.60, 20 minutes intra-service) and agreed that 92570 requires approximately the same amount of physician work and time as code 92557. The RUC agreed with the specialty society recommended physician times of pre-service time package 5 – Non-Facility Procedure without sedation/anesthesia minus 4 minutes (totaling 3 minutes) as the provider is primarily setting-up the patient to perform the tests; 15 minutes intra-service time, and 3 minutes immediate post-service time. The RUC agreed that the 92 Audiologist survey respondents median work RVU of 0.55 was appropriate, as 92570 requires 5 minutes less intra-service time than 92557. The recommended work RVU places this service in the proper rank order with other services provided by audiologists, as well as similar services provided by other health care professionals. For additional support the RUC compared 92570 to HCPAC MPC codes 97530 *Therapeutic activities, direct (one-on-one) patient contact by the provider (use of dynamic activities to improve functional performance), each 15 minutes* (work RVU = 0.44) and 97755 *Assistive technology assessment (eg, to restore, augment or compensate for existing function, optimize functional tasks and/or maximize environmental accessibility), direct one-on-one contact by provider, with written report, each 15 minutes* (work RVU = 0.62). **The RUC recommends a work RVU of 0.55 for code 92570.**

1627

92550

The RUC reviewed code 92550 *Tympanometry and reflex threshold measurements* which bundles codes 92567 and 92568. The specialty societies recommended a work RVU lower than these two combined services.

The RUC reviewed the survey results for 92570 in which 94 Audiologists and Otolaryngologists responded. The RUC compared 92550 to reference service 92568 *Acoustic reflex testing; threshold* (work RVU = 0.29, 8 minutes intra-service) and agreed that 92550 requires approximately the same amount of physician work and time as code 92568. The RUC agreed with the specialty society recommended physician times of pre-service time package 5 – Non-Facility Procedure without sedation/anesthesia minus 4 minutes (totaling 3 minutes) as the provider is primarily setting-up the patient to perform the tests; 10 minutes intra-service time and 3 minutes immediate post-service time. The RUC agreed that survey 25th percentile work RVU of 0.35 was appropriate, as 92550 requires slightly more time to perform than 92568 alone. The recommended work RVU places this service in the proper rank order with other services provided by audiologists,

as well as similar services provided by other health care professionals. **The RUC recommends the survey 25th percentile work RVU of 0.35 for code 92550.**

Practice Expense
The RUC recommends that the Audiologists' clinical labor time for codes 92541-92545 be reduced to zero, as all Audiologist time is transitioning to the work component. Additionally, the RUC recommends no clinical labor time for 92540-92550.

PLI
The RUC recommends that 92540 be crosswalked to 92620 and codes 92570 and 92550 be crosswalked to 92621.

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
92541		Spontaneous nystagmus test, including gaze and fixation nystagmus, with recording (Do not report 92541 when performed in conjunction with the set of 92542, 92544 and 92545)	XXX	0.40 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92540 Tracking Number JJ1 Specialty Society Recommended RVU: **1.50**

Global Period: XXX RUC Recommended RVU: **1.50**

CPT Descriptor: Basic vestibular evaluation, includes spontaneous nystagmus test with eccentric gaze fixation nystagmus, with recording, positional nystagmus test, minimum of 4 positions, with recording, optokineticnystagmus test, bidirectional foveal and peripheral stimulation, with recording, and oscillating tracking test, with recording.

(Do not report 92540 in conjunction with 92541, 92542, 92544, or 92545)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67 year old male presents with a three month history of spontaneous spells of incapacitating vertigo that last from 1-4 hours, occurring 1-2 times per month. He reports near simultaneous onset of fluctuating hearing loss on the left, vertigo, and left side tinnitus. He has a documented hearing loss in his left ear that varies over time.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

ercent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; ischarged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: The pre-service work includes a chart review for evidence in previous testing, current medications, and entering the patient's demographic information into the recording computer.

Description of Intra-Service Work: The intra-service work begins with prepping the skin and applying electrodes that will record the nystagmus. After the electrodes are affixed to the skin with conducting gel or paste, they must be monitored for a short time to allow the impedance to stabilize. After the electrodes are applied and stabilized, calibration of the nystagmus must be performed by measuring the eye movements while tracking a light stimulus that moved across a predetermined arc to constitute a specified number of degrees in each direction. The health care ovider then proceeds to the test battery which consists of four successive procedures: evaluation for spontaneous ystagmus, positional nystagmus testing, optokineticnystagmus testing, and oscillating tracking.
Spontaneous nystagmus: The qualified health care professional monitors eye movements with a recording system while the patient views targets in the center and eccentric positions to the right, left, up and down. The monitoring is then repeated with the eyes in similar positions but with visual fixation removed.

Positional nystagmus testing: The qualified health care professional moves the patient into a series of specific positions while recording the eye movements that occur once the position is achieved. The number of positions varies but a minimum of 4 are routine.

Optokineticnystagmus testing: The qualified health care professional presents a large visual field stimulus typic[redacted] composed of stripes or random dots that are set into motion to generate an optokineticnystagmus that is recorded analyzed for the speed of the eye referenced to the speed of the target.

Oscillating tracking: The qualified health care professional records eye movements while the patient views a target that moves in the patient's visual field in a sinusoidal oscillatory profile.

Perform the calculations necessary to determine magnitude and direction of nystagmus under each test condition, reviewing the data to ensure the absence of artifact that could adversely influence the results and interpretation, printing the nystagmus recordings for archival documentation, preparing a report of the diagnostic results and interpretation.

Description of Post-Service Work: Post-service work includes describing the results to the patient and notifying the referring physician of the test outcomes.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

e proposed value for this combined code will result in a substantial savings since the total value will be much less than ..e sum of the three individual total values. CMS made a decision to assign professional work to the audiologist's services codes beginning in 2007. Previously the audiology time was captured in PE only. The current professional work for the individual codes packaged into 92540 are based on old Harvard data and is virtually inexplicable because the exact physician activity is not known. Thus, the recommended RVW of 1.5 for 92540 with the elimination of the audiologist time from PE will result in a much lower total value.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This code was previously reported using 92541, 92542, 92544, and 92543.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Audiology How often? Commonly

Specialty Neurology How often? Sometimes

Specialty Otolaryngology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 250000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Used Medicare utilization as a starting point and assumes utilization in non-Medicare patients is slightly less than double.

Specialty Audiology Frequency 112500 Percentage 45.00 %

Specialty Neurology Frequency 25000 Percentage 10.00 %

Specialty Otolaryngology Frequency 112500 Percentage 45.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 140,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This number was taken from the 2007 Medicare utilization data in the RUC database

Specialty Audiology Frequency 63000 Percentage 45.00 %

Specialty Neurology Frequency 14000 Percentage 10.00 %

Specialty Otolaryngology Frequency 63000 Percentage 45.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 92620 is more appropriate.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

Global Period: XXX RUC Recommended RVU: **0.55**

CPT Descriptor: Acoustic immittancetesting, includes tympanometry (impedance testing), acoustic reflex threshold testing, and acoustic reflex decay testing.

(Do not report 92570 in conjunction with 92567, 92568, or 92569)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73 year-old female was referred for an audiologic evaluation with the chief complaint of progressive hearing loss and tinnitus in her right ear. No episodes of vertigo or imbalance were reported.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Pre-service work includes calling up the tympanometric program on the acoustic immittance unit and entering the patient's demographic information into the system.

Description of Intra-Service Work: Intra-service work for tympanometry begins by seating the patient next to the acoustic immittance unit. The audiologist informs and instructs the patient regarding the tympanometry procedure, apprising the patient regarding what to expect and asking that the patient not swallow or speak once the procedure begins. Otoscopy is then performed to inspect the ear canals and to evaluate the diameter of each canal. From that inspection a probe tip is selected that will permit a hermetic seal. The probe is inserted into the ear canal to a sufficient depth as to permit a hermetic seal. Air is pumped into the ear canal to a level of +200 daPa. The air pressure is then decreased over a range from +200 daPa to -400 daPa with the resulting immittance changes recorded on the instrument's screen. After the first ear is completed, the probe is switched to the opposite ear, and the process is repeated. The audiologist examines the data screen for the configuration of the tympanogram, the static compliance a gradient measurements, and equivalent volume of the ear canal.

The patient is instructed regarding the measurement of acoustic reflex thresholds and informed that she will hear loud sounds of approximately one second each. The probe is re-seated into the ear canal to again obtain a hermetic seal. An insert or supra-aural earphone is seated on the opposite ear to provide acoustic stimulation to elicit the reflexes. The

audiologist then ensures that the pressure in the ear canal corresponds to the maximum tympanic membrane compliance pressure for greatest recording sensitivity. A 500 Hz tone is presented at a level of 100 dB to the ear opposite the probe. The audiologist observes the waveform tracing on the unit screen to determine if there was evidence of a middle ear muscle contraction. If contraction was seen, the intensity of the tone is decreased in 10 dB steps until the reflex contraction is no longer observed. The stimulus intensity is then increased in 5 dB steps until the reflex is recorded once again. The lowest intensity necessary to evoke a middle ear muscle reflex is considered reflex threshold. If a reflex contraction was not observed with the initial stimulation of 100 dB, the intensity of the tone is increased to 105 dB and then 110 dB. This procedure is repeated for the ear contralateral to the probe for 1000 Hz, 2000 Hz, and 4000 Hz. Without adjusting the headset, the equipment is reconfigured to provide the stimulation and record the response through the probe. A similar procedure as described above is employed for the frequencies of 500 Hz, 1000 Hz, and 2000 Hz. After recording acoustic reflexes for contralateral and ipsilateral stimulation for the first ear, the probe is removed, the headset is reversed, the probe is reinserted into the opposite ear, and the procedure is repeated as described above. A total of 14 frequencies (4 right contralateral stimulation, 3 right ipsilateral, 4 left contralateral, and 3 left ipsilateral) are used to evaluate the reflex threshold patterns diagnostically.

For reflex decay determination, the audiologist informs the patient to expect to hear several very loud, possibly uncomfortable, sounds that will each have durations of 10 seconds. After the reflex threshold measurements have been completed, the audiologist re-sets the frequency of stimulation to 500 Hz and through the contralateral earphone presents a tone at a level 10 dB above the reflex threshold (typically between 100 dB and 115 dB HL) for 10 seconds. The acoustic immittance unit records the waveform trace of the strength of muscle contraction for the stimulus duration. The audiologist must examine the trace to determine if an amplitude decrement of 50% or more is present. After the 10 second stimulation, the audiologist must wait at least 30 seconds to permit the ear to recover from the extremely loud stimulus. This procedure is repeated for 1000 Hz with the same headset arrangement. The headset/probe assembly will be reversed to test the opposite ear in the contralateral stimulation paradigm for a total of four recordings.

The tympanogram findings are printed for acoustic reflex thresholds and reflex decay patterns, and the test results are synthesized into other aspects of the audiological evaluation. Test outcomes are recorded in a written report.

Description of Post-Service Work: The audiologist describes the results to the patient and referring physician, if needed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This code was previously reported using 92567, 92568, and 92569.

'ow often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
, the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Audiology How often? Commonly

Specialty Otolaryngology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Used Medicare utilization as starting point and assumed approximately twice the number of non-Medicare patients with sensory neural hearing loss for differential diagnosis.

Specialty Audiology Frequency 50000 Percentage 50.00 %

Specialty Otolaryngology Frequency 50000 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 50,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This number was taken from the 2007 Medicare utilization data the RUC database

Specialty Audiology Frequency 25000 Percentage 50.00 %

Description of Intra-Service Work: Intra-service work for tympanometry begins by seating the patient next to the acoustic immittance unit. The audiologist informs and instructs the patient regarding the tympanometry procedure, apprising the patient regarding what to expect and asking that the patient not swallow or speak once the procedure begins. Otoscopy is then performed to inspect the ear canals and to evaluate the diameter of each canal. From that inspection a probe tip is selected that will permit a hermetic seal. The probe is inserted into the ear canal to a sufficient depth as to permit a hermetic seal. Air is pumped into the ear canal to a level of +200 daPa. The air pressure is then decreased over a range from +200 daPa to -400 daPa with the resulting immittance changes recorded on the instrument's screen. After the first ear is completed, the probe is switched to the opposite ear, and the process is repeated. The audiologist examines the data screen for the configuration of the tympanogram, the static compliance and gradient measurements, and equivalent volume of the ear canal.

The patient is instructed regarding the measurement of acoustic reflex thresholds and informed that she will hear loud sounds of approximately one second each. The probe is re-seated into the ear canal to again obtain a hermetic seal. An insert or supra-aural earphone is seated on the opposite ear to provide acoustic stimulation to elicit the reflexes. The audiologist must then ensure that the pressure in the ear canal corresponds to the maximum tympanic membrane

compliance pressure for greatest recording sensitivity. A 500 Hz tone is presented at a level of 100 dB to the ear opposite the probe. The audiologist observes the waveform tracing on the unit screen to determine if there was evidence of a middle ear muscle contraction. If contraction was seen, the intensity of the tone is decreased in 10 dB steps until the reflex contraction is no longer observed. The stimulus intensity is then increased in 5 dB steps until the reflex recorded once again. The lowest intensity necessary to evoke a middle ear muscle reflex is considered reflex thresho If a reflex contraction was not observed with the initial stimulation of 100 dB, the intensity of the tone is increased to 105 dB and then 110 dB. This procedure is repeated for the ear contralateral to the probe for 1000 Hz, 2000 Hz, and 4000 Hz. Without adjusting the headset, the machine is reconfigured to provide the stimulation and record the response through the probe. A similar procedure as described above is employed for the frequencies of 500 Hz, 1000 Hz, and 2000 Hz. After recording acoustic reflexes for contralateral and ipsilateral stimulation for the first ear, the probe is removed, the headset is reversed, the probe is reinserted into the opposite ear, and the procedure is repeated as described above. A total of 14 frequencies (4 right contralateral stimulation, 3 right ipsilateral, 4 left contralateral, and 3 left ipsilateral) are used to evaluate the reflex threshold patterns diagnostically.

The tympanogram findings are printed and the test results are synthesized into other aspects of the audiological evaluation. Test outcomes are recorded in a written report.

Description of Post-Service Work: The audiologist describes the results to the patient and communicates with referring physician.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2009		
Presenter(s):	Robert C. Fifer,PhD, Kadyn Williams, AuD, Jane Dillon, MD		
Specialty(s):	Audiology, Otolaryngology

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.48	3.12
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.19	2.97
Urgency of medical decision making	3.04	2.79

Technical Skill/Physical Effort (Mean)

Technical skill required	3.31	3.06
Physical effort required	2.33	2.18

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.19	2.01
Outcome depends on the skill and judgment of physician	3.44	3.24
stimated risk of malpractice suit with poor outcome	2.57	2.44

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	2.51	2.39
Intra-Service intensity/complexity	3.12	2.87
Post-Service intensity/complexity	2.81	2.66

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an VPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value commendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This code was previously reported using 92567 and 92568.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Audiology How often? Commonly

Specialty Otolaryngology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2000000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Used Medicare utilization data as a starting point and assumed a high utilization for non-Medicare patients with middle-ear disorders.

Specialty Audiology Frequency 1000000 Percentage 50.00 %

Specialty Otolaryngology Frequency 1000000 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 945,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This number was taken from 2007 Medicare utilization data in the RUC database.

Specialty Audiology Frequency 472500 Percentage 50.00 %

Specialty Otolaryngology Frequency 472500 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 92621 is more appropriate.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from Five-Year Review

April 2009

Tendon Transfer

The RUC identified 26480, *Transfer or transplant of tendon, carpometacarpal area or dorsum of hand; without free graft, each tendon*, as potentially misvalued based on the recommendation of the Five Year Review Identification Workgroup. The code was referred to the Workgroup for review via the CMS Fastest Growing Screen. The RUC recommended that 26480 be surveyed.

The specialty society did not present compelling evidence regarding a change in the work RVU and, instead, provided evidence that the 26480 is correctly valued by its current work RVU of 6.76. The specialty society conducted a survey of 52 hand and orthopaedic surgeons. Survey respondents indicated a median intra-service time of 60 minutes and the specialty societies' expert panel selected pre-service time package number 3, straightforward patient/difficult procedure. The package includes 33 minutes of evaluation time, 15 minutes of scrub time, and the expert panel recommended adding 6 minutes to the 3 minutes of positioning time. The RUC agreed that a total of 9 minutes is required to position the patient's arm and hand throughout the duration of the procedure. The survey respondents indicated 15 minutes of immediate post-service time. No survey respondents indicated that 26480 is performed in the physician office setting and, therefore, one-half of a 99238 discharge day management procedure is appropriate. Survey respondents also indicated that three 99212 office visits and one 99213 office visits are typically performed post-operatively, which the RUC agreed with. The survey median work RVU for 26480 was 8.00, which the specialty and the RUC agreed was too high. Moreover, the current work RVU of 6.76 is lower than the lowest survey response of 6.85. While the survey may indicate that a higher work RVU than the current RVU is warranted, both the RUC and the specialty agreed that there is no compelling evidence beyond the survey to substantiate a change in the work since the code was valued through the Harvard studies. The RUC also looked to the survey key reference service, 25310, *Tendon transplantation or transfer, flexor or extensor, forearm and/or wrist, single; each tendon* (work RVU = 7.94), which is a very similar service. The reference service intra-service time is 60 minutes, the same as the median intra-service time for the surveyed code. However, the reference service requires slightly greater pre-service and post-service time. As such, the RUC agreed that the current work RVU of 6.76 for 26480 appropriately ranks the service within the family. **Therefore, the RUC recommends the survey physician times and post-operative office visits, and recommends maintaining the current work RVU of 6.76 for 26480.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
26480		Transfer or transplant of tendon, carpometacarpal area or dorsum of hand; without free graft, each tendon	090	6.76 (No Change)

SUMMARY OF RECOMMENDATION

CPT Code:26480 Tracking Number Specialty Society Recommended RVU: **6.76**

Global Period: 090 RUC Recommended RVU: **6.76**

CPT Descriptor: Transfer or transplant of tendon, carpometacarpal area or dorsum of hand; without free graft, each tendon

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old male suffers a loss of the ring finger extensor tendon at the dorsum of the hand. He undergoes a tendon transfer of the extensor indicis proprius to the distal stump of the extensor digitorum communis of the ring finger.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Percent of survey respondents who stated they perform the procedure; In the hospital 37% , In the ASC 63%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 89% , Kept overnight (less than 24 hours) 11% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 50%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Mark surgical site. Verify that all required instruments and supplies are available. Monitor/assist with pt positioning; padding of bony prominences; and application of thermal regulation drapes. Assess position of the extremities and head, adjust as needed. The patient's arm is placed on the hand surgery table. A tourniquet is applied to the proximal arm. Indicate areas of skin to be prepped. Scrub and gown. The arm and hand are prepped and draped. The arm is elevated and exsanguinated. The pneumatic tourniquet is inflated. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the dorsal aspect of the fourth metacarpal to expose the residual distal stump of the ring finger extensor digitorum communis. The distal tendon stump is dissected free from any surrounding scar tissue. An incision is made over the distal aspect of the second metacarpal to expose the extensor indicis proprius (EIP). The EIP is clearly identified and transected taking care not to injure the extensor hood. A counter incision is made at the distal edge of the extensor retinaculum and the EIP is identified and brought into the proximal wound. The EIP is freed of any connections to adjacent extensor tendons. A subcutaneous tunnel is created from the proximal wound to the distal stump of the ring finger extensor tendon. The EIP is gently passed in to the tunnel from proximal to distal. The EIP is then sutured to the distal stump of the ring finger extensor tendon taking care

to apply the appropriate tension. The tension on the tendon transfer is adjusted as needed. The wound is irrigated and then closed in layers.

Description of Post-Service Work:
Facility: Apply bulky dressing, reinforced with a splint. Discuss postoperative care with recovery room staff. Disc. surgery outcome with patient/family. Write brief operative note and medication orders in patient's chart. Monitor patient stabilization in the recovery room and circulation, sensation and motor function status of the operated extremity. Dictate operative report. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient/family including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Office: The patient is examined in the office the next day to remove dressings, assess circulation, sensation and motor function status, and redress wound. An order is written for the fabrication of a dynamic finger extension splint. At the end of the second postoperative week, the patient undergoes suture removal. At this visit and all other follow-up visits through the 90-day global period, the splint and range of motion are assessed; the occupational therapy prescription is adjusted as needed; and all necessary medical records and insurance forms are completed, included progress notes for the PCP.

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.21	3.26
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.55	2.62
Urgency of medical decision making	2.93	2.89

Technical Skill/Physical Effort (Mean)

Technical skill required	3.71	3.62
Physical effort required	2.62	2.72

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.17	3.10
Outcome depends on the skill and judgment of physician	3.90	3.79
Estimated risk of malpractice suit with poor outcome	2.93	2.74

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.26	3.29
Intra-Service intensity/complexity	3.45	3.37
Post-Service intensity/complexity	3.05	3.08

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

We are pleased to present survey data for CPT Code 26480 which was screened by the RUC 5YR ID Workgroup and CMS as one of the *fastest* growing procedures (>10%) in the Medicare fee schedule without regard to total number of procedures performed (ie, less than 400). The table below presents the RUC database Medicare utilization that resulted in the requirement / recommendation that we survey this code:

	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007
Freq	1,199	1,380	1,237	1,275	1,433	1,653	1,821	2,149	2,542	2,752	3,002
Chg		181	-143	38	158	220	168	328	393	210	250
%Chg		15%	-10%	3%	12%	15%	10%	18%	18%	8%	9%

Our consensus panel does not believe there is compelling evidence regarding a change in patient or technology to recommend an increase for code 26480. Without compelling evidence, we understand the current review is limited to evaluating whether the current RVW is correct. We agree with the survey data that indicate the typical patient is discharged from a facility on the day of the procedure (ie, same-day discharge). We also believe the intra-op time and post-op visits are an accurate representation of what is currently necessary for this procedure.

In comparison to the key reference code 25310 *Tendon transplantation or transfer, flexor or extensor, forearm and/or wrist, single; each tendon*, the survey code 26480 is almost identical - with the exception of incision location on the hand. Pre- and post-service work would be similar for both codes. The value for 26480 (RVW=6.76) and the recommended time and visit data result in an IWPUT of 0.041 which is less than the intensity of 99213. We believe the current survey data supports the current RVW of 6.76 for 26480.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 26480

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty hand surgery How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty plastic surgery How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 9000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Our consensus panel estimates the ratio is 3:1 for non-Medicare to Medicare patients, based on personal experience in the past year.

Specialty hand surgery Frequency 5600 Percentage 62.22 %

Specialty orthopaedic surgery Frequency 2500 Percentage 27.77 %

Specialty plastic surgery Frequency 750 Percentage 8.33 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2007 Medicare data

Specialty hand surgery Frequency 1880 Percentage 62.66 %

Specialty orthopaedic surgery Frequency 830 Percentage 27.66 %

Specialty plastic surgery Frequency 247 Percentage 8.23 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Use current code 26480.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Moderate Sedation Practice Expense Inputs

In 2005, CPT began identifying services in which moderate sedation is inherent and listed them in a separate addendum. The CMS reviewed its direct practice expense inputs database in 2008 and found 12 CPT codes that had moderate sedation practice expense inputs but were not listed in CPT's moderate sedation addendum. All 12 codes had been reviewed for practice expense direct inputs by the RUC prior to CPT 2005. CMS removed the moderate sedation inputs of all 12 codes for its 2009 physician fee schedule calculations and asked specialty societies to bring any of the codes forward to the RUC to reestablish the inputs. In February 2009, specialty societies contended that moderate sedation was inherent to two of these codes. The RUC discussed and agreed that moderate sedation was inherent in codes 22520 *Percutaneous vertebroplasty, one vertebral body, unilateral or bilateral injection; thoracic*, and 22521 *Percutaneous vertebroplasty, one vertebral body, unilateral or bilateral injection; lumbar.* **The RUC recommends that the moderate sedation practice expense inputs be added back to codes 22520 and 22521. In addition, the RUC recommends codes 22520 and 22521 be placed on CPT's Appendix G, summary of CPT codes that include moderate (conscious) sedation.**

facility PE RVUs and § 414.22(b)(5)(i)(B) discusses nonfacility PE RVUs. Language in each of these sections incorrectly implies that the facility PE RVU is lower than or equal to the nonfacility PE RVUs. However, there are some instances where the facility PE RVUs may actually be greater than the nonfacility PE RVUs. In order to address this inaccuracy, we proposed to revise § 414.22(b)(5)(i)(A) and (B) to remove this language.

We received no comments on our proposed technical change and have revised the regulations at § 414.22(b)(5)(i)(A) and (B) as proposed.

e. Other PE Direct Input Issues

(i) *Removal of Conscious Sedation (CS) PE Inputs for Services in Which CS is not Inherent—Technical Correction*

In reviewing the PE database, we noted that the conscious sedation (CS) PE inputs for 12 CPT codes in which CS is not inherent had not been removed after CPT 2005 began identifying these codes in a separate Addendum. The CS inputs for CPT codes 19300, 22520, 22521, 31717, 62263, 62264, 62268, 62269, 63610, 64585, 64590, and 64595 had been added by the AMA RUC's PEAC prior to CY 2005. At that time, the AMA RUC recommended deletion of the CS PE inputs for all procedures that were not identified in the CPT 2005 manual Addendum which lists the services in which CS is inherent; and thus include the associated direct PE inputs. Due to a technical error, these inputs were not removed for CY 2005. We have removed the CS PE inputs for the 12 CPT codes noted above. We ask that the AMA RUC permit specialty societies to bring any CPT codes forward to either the February or April 2009 AMA RUC meetings should any other discrepancies between the CPT Addendum and the PE database be identified.

(ii) Jejunostomy Tube Price

A comment received on the CY 2009 PFS proposed rule stated that we had mistakenly entered the price for a set of 2, rather than just 1, jejunostomy tube in each of the following CPT codes 49441, 49446, 49451, and 49452. So that the price of this PE supply can be properly valued as part of the PE RVUs for each of the four services in which it is found, we have changed the price of this supply from $198 to $97.50 in CPT codes 49441, 49446, 49451, and 49452. In addition, because it's correct price is less than $150, this item was erroneously placed on the list for re-pricing of higher-cost supplies on Table 29 in the proposed rule; and, as a result of this price correction, it has been removed from the list of supply items in need of repricing.

(iii) Supply Code SH079, Collagen, Dermal Implant (2.5ml uou) (Contigen)

We received comments from a specialty society representing urologists noting that the dermal collagen implant, priced at $317, was an inappropriate supply input for CPT 52330. The specialty society asked that we remove this supply from this service. We agree that inclusion of the dermal collagen implant as a supply input for CPT code 52330 is not appropriate. The PE RVUs for CPT 52330 reflect the removal of this supply item.

(iv) Contractor Pricing of CPT 77371 for Stereotactic Radiosurgery (SRS) Treatment Delivery

CPT code 77371, *Radiation treatment delivery, stereotactic radiosurgery (SRS) (complete course of treatment of cerebral lesion(s) consisting of one session); multi-source Cobalt 60 based,* (more commonly known as Gamma Knife) was a new CPT code for CY 2007. At that time, we accepted nearly all of the AMA RUC PE recommendations for this procedure (we did not accept the Cobalt 60 radiation source as a direct PE input) during CY 2007 rulemaking, and these recommendations are reflected in the PE RVUs for CPT 77371. The PE inputs for CPT 77371 had been proposed by the sitting AMA RUC specialty society representing therapeutic radiation oncology physicians. The AMA RUC discussed and amended the specialty's proposal for direct PE inputs (particularly the amount of clinical labor time) prior to agreeing on the final AMA RUC recommendation that was forwarded to CMS for CY 2007. Due to the equipment expense (nearly $4 million) along with the many Nuclear Regulatory Commission (NRC) requirements for construction of the facility required to furnish these procedures, all but one of these facilities is connected with a hospital setting, leaving a single free-standing nonfacility provider.

Comment: We received 3 comments stating that the PE RVUs listed in Addendum B for CPT 77371 are exceptionally inadequate. All commenters, including the single freestanding nonfacility based provider, noted the difference in payments between those made under OPPS and the PFS for CPT 77371. For CY 2009, the commenters noted that the proposed OPPS payment is $7,608 and the PFS payment under the proposed rule would be $1,260. A freestanding nonfacility provider noted that it had worked with the Medicare contractor but was unsuccessful in securing a higher payment because the contractor could not deviate from the established PE RVUs. Two commenters also stated that they believe the direct PE inputs are incorrect since the cost data they had gathered from other facility providers of this stereotactic radiosurgery (SRS) service included extra clinical labor time due to Nuclear Regulatory Commission (NRC) requirements for both the physicist and the registered nurse. In addition, they disagreed with our decision to treat the Cobalt 60 radiation source (recommended by the AMA RUC as a 1-month renewable equipment item) as an indirect PE cost in the CY 2007 PFS final rule with comment period. The commenters have asked us to contractor-price CPT 77371 for CY 2009 if a payment correction cannot be made in the final rule.

Response: We will ask the AMA RUC to review the direct PE inputs for this code in light of these comments. In the interim, we believe the commenters have raised sufficient questions regarding the propriety of the direct PE inputs and PE RVUs established for this new code in 2007 to warrant contractor-pricing for CPT 77371 for CY 2009.

f. Supply and Equipment Items Needing Specialty Input

We have identified some supply and equipment items from the CY 2008 final rule with comment period for which we were unable to verify the pricing information (see Table 2: Items Needing Specialty Input for Pricing and Table 3: Equipment Items Needing Specialty Input for Pricing). For the items listed in Tables 2 and 3, we are requesting that commenters provide pricing information. In addition, we are requesting acceptable documentation, as described in the footnote to each table, to support the recommended prices. For supplies or equipment that previously appeared on these lists, we may propose to delete these items unless we receive adequate information to support current pricing by the conclusion of the comment period for this final rule.

In Tables 4 and 5, we have listed specific supplies and equipment items related to new CY 2009 CPT codes that are discussed in section V. of this final rule with comment period. We have added these items to the PE database along with the associated prices (on an interim basis). We plan to propose finalized pricing information in the CY 2010 PFS proposed rule. Item prices identified in these tables are also reflected in the PE RVUs in Addendum B. In addition, we have asked commenters to submit specific information in response to the

RE: Conscious Sedation Direct Practice Expense Inputs for Codes 22520 and 22521

Dear Drs. Rich & Moran:

The American College of Radiology (ACR) and Society of Interventional Radiology (SIR), represent the dominant specialties performing vertebroplasty procedures (reported using codes 22520/ 22521) as per the 2006 Medicare claims data in the RUC Database. We find that moderate (conscious) sedation is inherent to the performance of vertebroplasty. The ACR and SIR support the continued inclusion of conscious sedation direct practice expense for the non-facility setting for these codes. Additionally, we respectfully, request that the RUC advise the CPT Editorial Panel to add codes 22520 and 22521 to Addendum G of the CPT manual *(Summary of CPT Codes that include Moderate (Conscious) Sedation)*.

In support of this request, please find attached supporting literature with articles that specifically include mention of moderate (conscious) sedation in the description of the technique for vertebroplasty.

Your consideration of this request is greatly appreciated.

Sincerely,

Geraldine McGinty, MD

Percutaneous Vertebroplasty in Patients With Intractable Pain From Osteoporotic or Metastatic Fractures: A Prospective Study Using Quality-of-Life Assessment

Gordon Cheung, MD, FRCPC; Edward Chow, MBBS, MSc, FRCPC; Lori Holden, BSc, MRTT; Marjan Vidmar, MD, MSc; Cyril Danjoux, MD, FRCPC; Albert JM Yee, MD, FRCSC; Ruth Connolly, BSc, MRTT; Joel Finkelstein, MD, FRCSC

Abstract

Purpose: Percutaneous vertebroplasty (PVP) is a minimally invasive outpatient procedure whereby vertebral compression fractures are stabilized by the injection of bone cement, or polymethyl methacrylate (PMMA). Rapid partial or complete pain relief can usually be achieved through this procedure. We prospectively evaluate the efficacy of PVP in the relief of pain and improvement in quality of life of patients with intractable pain from osteoporotic and metastatic fractures.

Materials and Methods: Patients with intractable pain from vertebral metastases (many resistant to palliative radiation therapy) and patients with intractable painful osteoporotic fractures were treated with parapedicular or transpedicular injection of PMMA. Plane X-rays, computed tomography (CT) scan, and magnetic resonance imaging (MRI) scan were performed on all patients. With a reflex hammer, percussion pain was correlated to the imaging abnormalities. The preplanning CT scan was used to calculate the exact entry point and angle of the bone-biopsy needle. All patients were assessed before and after the procedure for quality of life and amount of pain. The following measures were used: 1) the Edmonton Symptom Assessment System (ESAS), for global pain, nausea, tiredness, depression, anxiety, drowsiness, appetite, sense of well-being, and shortness of breath; 2) a site-specific pain score (SSPS); 3) the amount of analgesic intake in morphine equivalents in the last 24 hours; and 4) the Townsend Functional Assessment Scale (TFAS), ascertaining mobility. A postprocedural CT scan was performed the same day on all patients. Follow-up assessment consisted of a phone call at Days 1, 2, and 4 and Weeks 1, 2, 4, 8, and 12. Patients with recurrent back pain or complications were followed in the bone metastases clinic.

Results: Thirty patients (19 women, 11 men) were evaluated. Their median age was 68 years (range 31 to 87 years). Thirty procedures (n = 30) at 45 vertebral levels were performed; 13 were for pathologic fractures, and 17 were for osteoporotic fractures. SSPS showed a decrease of 2 or more levels in 88.5% of patients at 12-week follow-up. The mean SSPS with movement was 8.7 preprocedure and 1.8 postprocedure ($P < 0.0001$). Also, there was significant improvement in all 9 ESAS domains ($P < 0.0004$). The ingestion of analgesics in morphine equivalents showed a trend toward reduction post-PVP ($P < 0.0599$). When the patients with pathologic fractures were separated out, the reduction in ingestion of analgesics was significant ($P < 0.0008$). The TFAS demonstrated significant improvement in patient mobility and function. Extravertebral extravasation of cement was noted in 55.6% of the levels. We used a general linear mixed-model repeated-measures analysis of variance to analyze the data.

Conclusions: PVP in osteoporotic and metastatic fractures significantly improved many patients' global quality-of-life scores and function by markedly decreasing their back pain and reducing their intake of pain medications. The procedure is safe, with no serious complications noted in our study.

Key Words: vertebroplasty, fracture, prospective

Abrégé

Objectif : La vertébroplastie percutanée (VPP) est une intervention effractive minimale pratiquée sur les patients externes, par laquelle les fractures de tassement vertébral sont stabilisées par l'injection de ciment d'os, ou polyméthacrylate de méthyle (PMMA). Un soulagement rapide partiel ou complet de la douleur s'obtient habituellement grâce à cette intervention. Nous avons évalué prospectivement l'efficacité de la VPP à soulager la douleur et à améliorer la qualité de vie des patients souffrant de douleur irréductible à cause de fractures ostéoporotiques et métastatiques.

Matériel et méthodes : Des patients souffrant de douleur irréductible à cause de métastases vertébrales (dont beaucoup résistent à la radiothérapie palliative) et des patients souffrant de fractures ostéoporotiques douloureuses rebelles ont été traités par injection de PMMA parapédiculaire ou transpédiculaire. Des radiographies planes, des tomodensitogrammes et des imageries par résonance magnétique (IRM) ont été exécutés pour tous les patients. À l'aide d'un marteau à réflexe, la douleur de la percussion était corrélée aux anomalies de l'imagerie. Le point d'entrée exact et l'angle de l'aiguille de la biopsie osseuse ont été calculés à l'aide du tomodensitogramme préparatoire. La qualité de vie et l'intensité de douleur de tous les patients ont été évaluées avant et après l'intervention. Les mesures suivantes ont été utilisées : 1) le système d'évaluation des symptômes d'Edmonton (ESAS), pour la douleur générale, la nausée, la fatigue, la dépression, l'anxiété, la somnolence, l'appétit, le sentiment de bien-être et l'essoufflement; 2) une échelle de douleur spécifique au site (SSPS); 3) la quantité d'analgésique prise en équivalents de morphine dans les 24 dernières heures; et 4) l'échelle d'évaluation fonctionnelle de Townsend (TFAS), estimant la mobilité. Un tomodensitogramme post-intervention a été effectué le même jour pour tous les patients. L'évaluation de suivi consistait dans un appel téléphonique aux 1er, 2e et 4e jours, et aux 1re, 2e, 4e, 8e et 12e semaines. Les patients ayant des maux de dos récurrents ou des complications ont été suivis à la clinique des métastases osseuses.

Résultats : Trente patients (19 femmes, 11 hommes) ont été évalués. L'âge moyen était de 68 ans (de 31 à 87 ans). Trente interventions (n = 30) à 45 niveaux vertébraux ont été exécutées. Treize interventions étaient pour des fractures pathologiques, et 17 traitaient des fractures ostéoporotiques. La SSPS a indiqué une diminution de 2 niveaux ou plus chez 88,5 % des patients à la 12e semaine de suivi. La moyenne de la SSPS avec mouvement était de 8,7 pré-intervention, et de 1,8 post-intervention (P < 0,0001). De même, il y avait une amélioration significative dans tous les 9 domaines du ESAS (P < 0,0004). La prise d'analgésiques en équivalents de morphine indiquait une tendance à la réduction après la VPP (P < 0,0599). Lorsque les patients ayant des fractures pathologiques ont été séparés, la réduction de la prise d'analgésiques était significative (P < 0,0008). La TFAS démontrait une amélioration significative de la mobilité et du fonctionnement des patients. L'extravasation extravertébrale du ciment a été notée dans 55,6 % des niveaux. Nous avons utilisé une analyse de la variance à mesures répétées selon un modèle mixte général linéaire pour analyser les données.

Conclusions : La VPP pour les fractures ostéoporotiques et métastatiques a amélioré significativement les scores généraux de qualité de vie et le fonctionnement de nombreux patients, en diminuant considérablement leurs maux de dos et en réduisant leur prise d'analgésiques. L'intervention est sûre, sans complications sérieuses notées dans notre étude.

Percutaneous vertebroplasty (PVP) was first pioneered in France by Galibert et al in 1987 for treating hemangiomas involving the spine.[1] PVP has become increasingly popular for the treatment of intractable pain due to vertebral collapse from various diagnoses. Reported not only for benign conditions such as vertebral hemangiomas and osteoporotic vertebral fractures,[2,3] the technique has been increasingly used for pathologic fractures resulting from primary or metastatic malignancies or metabolic bone diseases.[4–11]

Few large clinical series exist, and despite the increasing use of PVP, there are to date no controlled prospective studies on its safety and efficacy with long-term follow-up. Moreover, there are few prospective studies that evaluate quality of life and function measures according to validated generic and disease-specific measures.[12–16] This study prospectively evaluates the efficacy of PVP in the relief of pain and improvement in quality of life of patients with intractable pain from osteoporotic and metastatic fractures.

Materials and Methods

Patient Demographics

We studied 30 PVP procedures performed on 30 consecutive eligible patients for 45 treated levels; the patients had intractable pain from osteoporotic or metastatic fractures. We define a procedure as a case performed at a single sitting, whether 1, 2, or 3 vertebroplasties were performed. A single operator performed the procedure in a single tertiary care centre on patients referred over a 2-year period between July 2000 and September 2002. Patients were referred for the evaluation of acute vertebral body collapse diagnosed radiographically. Inclusion criteria for PVP included fractures occurring without trauma or with minor trauma (such as fall from standing height). Patients over age 18 years with intractable thoracic or lumbar pain secondary to a vertebral fracture were eligible. Pain was present for a minimum of 4 weeks and refractory to conservative therapy (that is, rest, activity modification, physical therapy, and analgesics) in the osteoporotic group and to conservative or palliative radiation therapy in the metastatic group. Other criteria included clinical examination for percussion tenderness with a reflex hammer, correlating to an osteoporotic or metastatic fracture on imaging with computed tomography (CT) and magnetic resonance imaging (MRI). We excluded patients with coagulopathy, retropulsion of bone, or epidural tumour causing significant thecal sac compression or neural foraminal narrowing. We also excluded patients presenting with neurologic deficits related to the spine. Significant vertebral body collapse to less than one-third of height was a relative contraindication.

A multidisciplinary team consisting of an orthopedist, a radiation oncologist, and a neuroradiologist assessed the patients. Routine anteroposterior and lateral plain radiographs, CT scan (LightSpeed QX/i CT scanner, GE Healthcare, Milwaukee, WI), and MRI (Signa LX Twin Speed MRI scanner, GE Healthcare)

Table 1 Age and sex of patients by fracture type

Fracture Type	Sex	*n*	Age (years) Median	Range
Cancer		13	66	31–87
	Women	8	64	31–77
	Men	5	77	60–87
Osteoporosis		17	68	49–87
	Women	11	68	60–87
	Men	6	64	49–81

imaging were performed on all patients. The decision to treat each patient with PVP was reached by consensus. The study cohort consisted of 30 patients, on whom vertebroplasties were performed at 45 vertebral levels. Informed consent was obtained from all patients for the PVP procedure.

Imaging review

Preprocedural MRI scans were performed on all patients to assess for those patients with significant vertebral plana, neural foraminal compression, or significant thecal sac compromise from bony retropulsion or epidural tumour. To facilitate a safe procedure, the entry point and angle of the bone-biopsy needle were calculated with a planning CT scan with the patient in prone position.

Procedural Technique

A single operator performed each PVP. Thirty minutes before the procedure, 1 g of intravenous cefazolin (Ancef) and 10 mg of dexamethasone (Decadron) were administered. Conscious sedation for the procedure included 50 μg of intravenous fentanyl and 5 mg of midazolam (Versed). Patients were then placed prone on an angiogram table (Integris V3000, Philips, The Netherlands). All patients were treated with fluoroscopic guidance. In general, a parapedicular approach was used for thoracic fractures and a transpedicular approach was used in lumbar fractures. The entry point on the patient's skin and the angle of the needle were extrapolated from the preplanning CT scan. Liberal local anesthesia with lidocaine was given. An Osteo-Site (Cook, Bloomington, IN) bone-biopsy needle (11- or 13-Gauge) was directed into the anterior one-third of the vertebral body, guided fluoroscopically and by gentle taps with an orthopedic hammer. Chilled Codman cranioplastic polymer powder (Johnson & Johnson, Raynham, MA) was mixed with 1.5 vials (9 g) of sterile barium sulfate to increase its opacity. The cement was injected through the bone-biopsy needle under close fluoroscopic guidance. The injection was terminated when the cement reached the posterior one-third of the vertebral body or when paravertebral or epidural venous filling was seen. A total of 3 to 6 mL was injected into the vertebral body. A postprocedural CT scan of the treated levels was performed the same day on all patients to evaluate vertebral body fill and potential cement extravasation. Patients were discharged the same day.

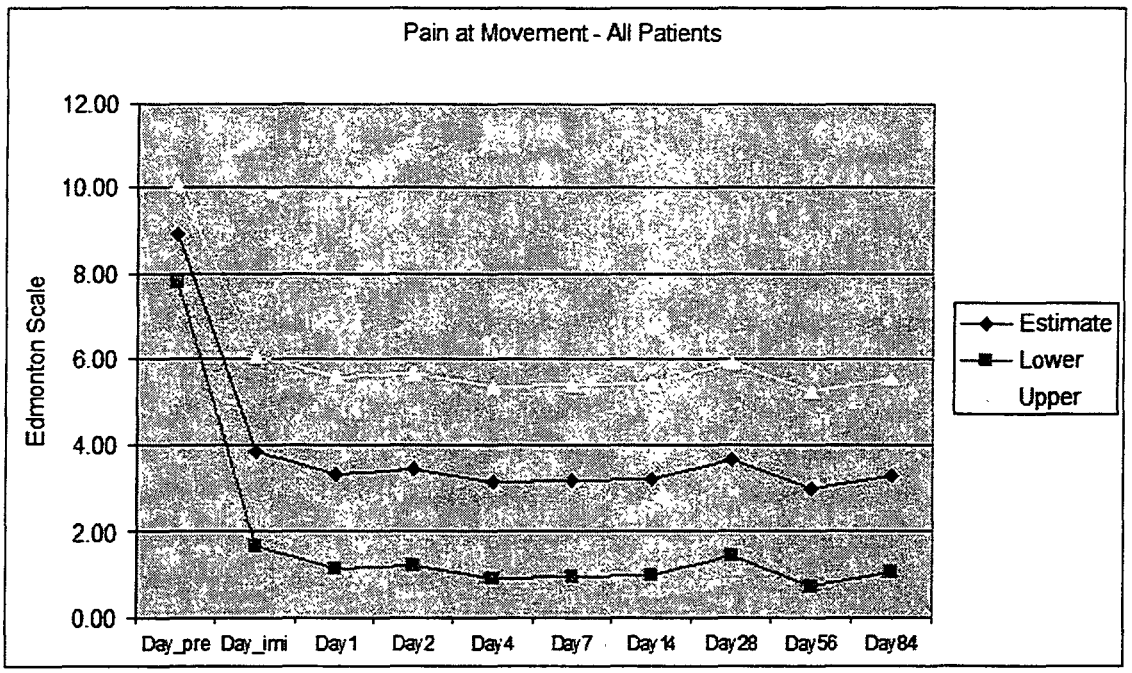
A bone biopsy was not felt to be necessary in any of the patients because the differentiation of osteoporotic fracture and pathologic fracture was never in question, according to the CT and MRI findings.

Outcome Measures

We assessed quality of life for all patients before and after the procedure, using 1) the Edmonton Symptom Assessment System (ESAS),[17] 2) the Townsend Functional Assessment Scale (TFAS),[18] 3) morphine equivalents, and 4) a site-specific pain score (SSPS). Patients were evaluated postprocedure by telephone calls on Days 1, 2, and 4 and at Weeks 1, 2, 4, 8, and 12. The ESAS was designed to assess the multidimensional nature of quality of life specific to palliative care and has been demonstrated to be valid and reliable in patients with terminal cancer.[17,19] The ESAS is a 9-item, patient-rated, symptom verbal rating scale with domains in global pain, nausea, tiredness, depression, anxiety, drowsiness, appetite, sense of well-being, and shortness of breath. Each domain is scored from 0 to 10, with higher scores representing increased disability. The TFAS is a physician-determined categorical assessment of the patient's physical disability. Patients were classified into 1 of 4 categories: A = normal pain-free function, B = normal function with pain, C = significantly limited function requiring some type of prosthesis (for example, for lower extremity, a walker, a cane, or crutches for ambulation), and D = nonfunctional (for example, wheelchair-bound or bedridden). Before and after the procedure, the patient's amount of oral analgesic and narcotic intake in the preceding 24 hours was converted to morphine equivalents according to standardized equivalence tables. The patient's back pain at the site of the fracture was evaluated with the SSPS, (range 0 to 10, with 0 = pain-free and 10 = worst pain possible), both at rest and with movement. This was a subjective verbal evaluation determined from the patient's response. Site-specific pain is defined as a specific focal area of back pain that can easily be localized by the patient and by the radiologist with percussion by a reflex hammer; this site correlates closely with a vertebral fracture.

Of the 30 patients, 3 had subsequent successful pain-relieving vertebroplasty procedures, but we used only the data from the first vertebroplasty procedure in our analysis to avoid skewing the results (2 were for new adjacent fractures, and one was for a nonadjacent metastasis). Any missing values for quality of life, morphine equivalents, and SSPS were replaced with a median value calculated by using the postoperative data to increase the precision of the results. Three patients did not complete the study. Two died (one by Week 2 and one by Week 4), and one

Figure 1 Site-specific pain score (SSPS), pain with movement. Estimates are averages that were produced with the repeated measure analysis, general linear mixed model. The lower and upper values indicate the 95% confidence interval.



withdrew during Week 4. For these 3 patients, the data collected up to Day 14 were included in the analysis.

Statistical analysis

To evaluate the effect of PVP on patient-derived ESAS quality-of-life domains, morphine-equivalent analgesic requirements, and SSPS, we compared preprocedural and the postprocedural values, using used a general linear mixed-model repeated measures analysis of variance. For multiple comparisons, statistical significance was assumed to be a P value of less than 0.01. Any missing values for quality-of-life measures, morphine equivalents, and SSPS were replaced with the median value, which we calculated from postprocedural data only.

Results

PVP was performed on 30 patients for a total of 30 procedures at 45 treated vertebral levels. The patients included 19 women and 11 men with a mean age of 67.2 years (range 31 to 87 years). Sixteen lumbar (35.6%) and 29 thoracic (64.4 %) levels were treated. Eighteen of the 30 patients had a history of cancer. Of these 18 cases, 13 procedures were for pathologic fractures, and 5 were for osteoporotic fractures (Table 1). In total, 17 procedures were for osteoporotic fractures. Pain duration ranged from 1 month to 5 years, with a mean of 10 months. The sex distribution was equal among the groups of patients with pathologic and osteoporotic fractures (Table 1).

SSPS, both at rest and with movement, was decreased significantly ($P < 0.0001$) in the immediate postoperative period and was sustained through to day 84 ($P < 0.0001$) (Figure 1, Table 2). The mean SSPS with movement was 8.7 preprocedure and 1.8 postprocedure, with a 12-week minimum follow-up. At Day 84, 24 of 27 patients had a decrease in SSPS of 2 or more, both at rest and with movement. Three patients had no response or only minimal improvement in pain. The SSPS for both the separated osteoporotic fractures and the pathologic fractures showed significant improvement in back pain after the procedure ($P = < 0.0001$) (Table 2). Overall, there was a trend to reduced analgesic consumption ($P < 0.0599$) (Table 2). This reduced analgesic consumption becomes significant in patients with osteoporotic fractures ($P < 0.0008$) when they are separated from patients with pathologic fractures ($P < 0.7471$).

A statistically significant overall improvement in quality of life ($P < 0.0004$) for both osteoporotic fractures and pathologic fractures was noted at Week 12 post-PVP. However, stratification showed that patients with osteoporotic fractures had a significantly greater quality-of-life improvement than did patients with pathologic fractures (Table 2, Table 3).

The stratified analysis by fracture type showed a difference in the degree of improvement between pathologic and osteoporotic fractures for quality-of-life measures (that is, nausea, tiredness, depression, anxiety, appetite, well-being, and shortness of breath) and pain with movement (SSPS). There

Table 2 Postprocedure *P* values for SSPS, ESAS, morphine equivalents, and TFAS, stratified by fracture type at follow-up

	Day 1	Day 84		
	All	All	Osteoporotic fracture	Pathologic fracture
SSPS, with movement	< 0.0001	< 0.0001	< 0.0001	< 0.0001
SSPS, at rest	< 0.0001	< 0.0001	< 0.0001	< 0.0001
General pain	< 0.0001	0.0004	0.001	0.2428

Morphine equivalents	0.6646	0.0599	0.0008	0.7471
TFAS	0.01	0.002	0.058	0.2231

ESAS = Edmonton Symptom Assessment System; SSPS = site-specific pain score; TFAS = Townsend Functional Assessment Scale.

Table 3 Stratified analysis by fracture type: osteoporotic, compared with cancer, fractures

Domain	*P*
General pain	0.9639
Nausea	0.0209
Tiredness	0.0028
Depression	< 0.0001
Anxiety	0.0062
Drowsiness	0.4334
Appetite	0.0001
Well-being	0.0049
Shortness of breath	< 0.0001
Pain at rest	0.4633
Pain with movement	0.0045
Morphine equivalents	0.2558

was no significance by fracture type for pain at rest (SSPS), morphine equivalents, general pain, or drowsiness (Table 3).

The TFAS at 12 weeks demonstrated significant improvement in mobility ($P < 0.002$). The results of the TFAS by fracture type suggested no difference between pre- and postoperative functional status. However, the *P* value for the osteoporotic patients was close to the conventional level of statistical significance ($P = 0.0580$), suggesting a probable improvement in mobility.

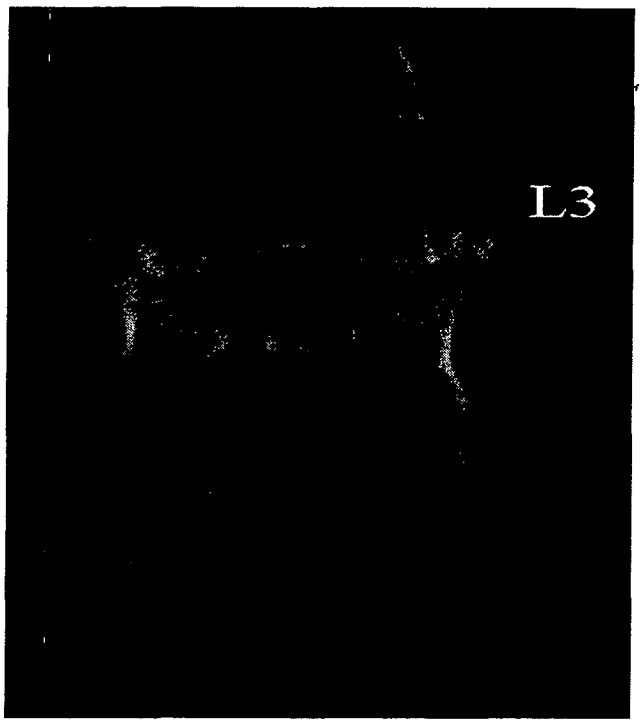
Subsequent Procedures and Complications

Cement extravasation was noted in 25 of 45 levels (55.6%). Extravasation sites include anterolateral or perivertebral soft tissues in 10 levels, superior or inferior disc space in 19 levels, and paravertebral veins in 2 levels; the epidural space of the spinal canal was encountered in 3 levels. Some levels had more than one type of cement extravasation. No neural foraminal extravasation of cement was noted.

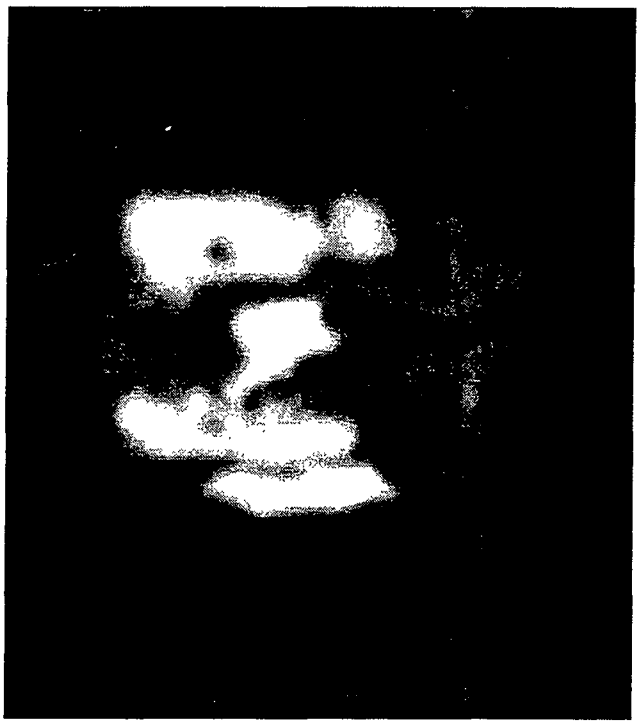
One additional patient required surgical decompression of cement from the spinal canal; this was related to extravasation of cement through the epidural veins that caused spinal cord

Figure 2 A and B Percutaneous vertebroplasty (PVP) at L3 and L4 in an osteoporotic woman, aged 72 years.

A: Coronal computed tomography (CT) scan of healed inferior endplate fracture of L3 and chronic unhealed L4 compression fracture



B: Post PVP at L3 and L4 with extravasation of cement into the L3-4 and L4-5 disc space via the superior and inferior endplate fractures of L4



compression. The extravasation was not appreciated because of the significantly increased bone density and difficulty of injecting into an osteoblastic metastasis. The patient had a stable mild posterior column deficit as a result of the extravasation. Her SSPS at rest improved from 8 prior to the procedure to 6 immediately after the procedure, but her SSPS with movement was unchanged (10/10), as was her TFAS score. Another patient had intradiscal extravasation of cement resulting in a disc herniation a few days later and recurrent new low back pain (Figure 2). The original pain was improved.

Two preterminal patients with metastatic disease died as a result of their primary disease at Weeks 2 and 4, prior to their 12-week follow-up. There were no deaths directly related to PVP treatment. One patient withdrew at Week 4. All 3 of these patients had reported significant, almost immediate, improvements in their ESAS score and SSPS that appeared sustained to their latest follow-up.

As noted above, 3 of the 30 patients underwent a subsequent vertebroplasty procédure at a different time. Two were for new adjacent fractures, and one was for a nonadjacent metastasis. Even though all 3 patients benefited from their second procedure, showing significant relief of pain, only the initial procedure was included in data analysis so that the data would not be skewed.

Discussion

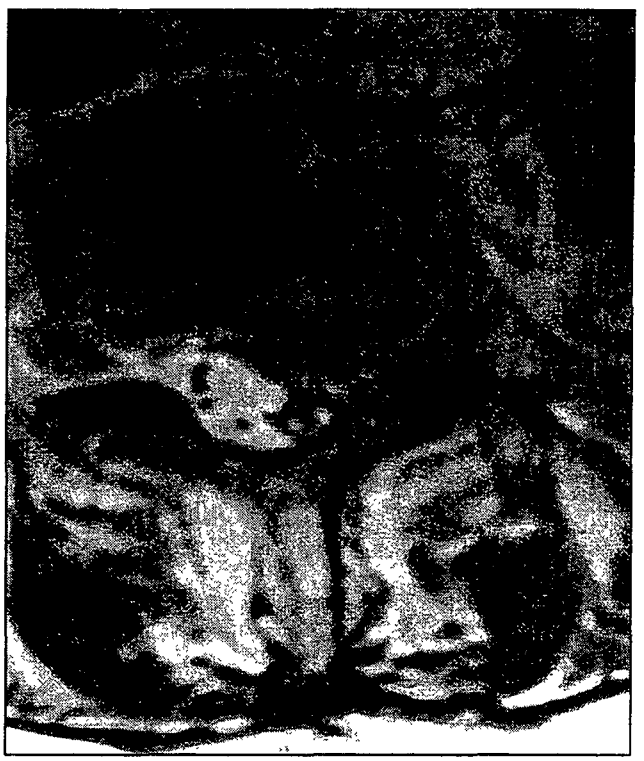
Only a handful of studies evaluate the quality of life after PVP, and even fewer prospective studies evaluate patients' quality of life, pain, and function before and after the procedure.[12,13,16,20] None of the published prospective studies include PVP of pathologic fractures. Our paper is unique in that our prospective quality-of-life study includes a comparison of both osteoporotic and pathologic fractures. We include both types of fractures to provide data that can be generalized to all types of fractures seen for PVP in Canada.

The largest published prospective study evaluating quality of life consists of 46 patients with 66 treated osteoporotic vertebral body fractures.[13] Pain and quality of life improved significantly, as evaluated by the Osteoporosis Quality of Life Questionnaire; improvement was maintained for at least 6 months after PVP. This is comparable to our study, the results of which demonstrate significant and almost immediate postprocedural improvement in pain, as judged by the ESAS, global pain measure, and SSPS. Concordant with the improvement in pain, patients reported significant improvements in all other ESAS domains. The patients' overall sense of well-being, depression, anxiety, and appetite appears to be attributed to a marked decrease in pain severity. The improvement in quality-of-life scores was sustained during our 12-week follow-up.

Figure 2 C and D Patient developed new left radicular pain 1 week later. Sagittal and axial T_1-weighted magnetic resonance (MR) image shows a new large left central L4-5 extrusion (black arrow). Note the dark signal (representing cement) within the L4-5 disc

C

D



The literature shows that significant pain relief is afforded in 70% to 80% of patients with pathologic fractures and in more than 90% of patients with osteoporotic fractures.[2,21,22] Pain relief is apparent within 1 to 2 days and seems to persist over months to years.[23,24] Our data are consistent with the literature showing that PVP provides significant immediate (within 1 day) and short-term (up to 12 weeks) pain relief. Matin found that fractures of longer than 6 months' duration typically do not benefit from vertebroplasty,[25] although this was not our experience. One patient had experienced intractable pain for 5 years but still had complete pain relief after the procedure. Fractures more than 1 year old can benefit from PVP, but complete pain relief is more likely with less mature fractures.[26]

Since many of our patients had significant comorbidities, including cancer with multiple bone metastases, we evaluated not only their global pain, using the ESAS, but also site-specific back pain related to their specific fracture or fractures. Not only did our results demonstrate a dramatic reduction in SSPS following the procedure, overall global pain also showed significant improvement, which may indicate the extent to which the patients' presenting local vertebral symptoms were a significant component of their overall global perception of pain. Although not statistically significant, there was a trend for decreased intake of analgesics, as measured by morphine equivalents. This simply reflects the high number of patients in this series (13/30) who had an underlying diagnosis of cancer with a pathologic fracture. This is borne out when we analyze the decrease in analgesic intake among the patients with pathologic fractures ($P < 0.7471$) separately from those with osteoporotic fractures ($P < 0.0008$). Patients who present with bony metastasis often present late in their disease course and have a high baseline narcotic requirement for their multiple bony metastases. Following the procedure, the cancer patients were able to function and move more comfortably at similar or slightly lower dosages; however, many could not be weaned off their pain medications, unlike the osteoporotic fracture patients. The cancer patients had multiple bone metastases causing site-specific pain or other pain, such as visceral pain Reduction of pain from the most painful site often unmasked pain from other sites, necessitating continuation of their analgesics.

Both osteoporotic patients and pathologic fracture patients demonstrate significant improvement in quality-of-life scores. This is no doubt related to the significant decrease in back pain. One might also anticipate that a lower intake of analgesics would contribute to an improved perception of quality of life as reflected by less drowsiness and nausea and improved appetite. When the data are stratified by fracture type, it is apparent that osteoporotic patients enjoy an even greater improvement in

quality of life than do cancer patients, largely because this is their only source of pain.

The TFAS demonstrates significant improvement in patient mobility after the procedure. The significance is diminished when the sample is subdivided into fracture type, presumably because of a significantly smaller sample size. Not only is mobility improved, many patients note better posture and increased body height, related to partial restoration of vertebral body height with PVP. This was recently reported to occur in about one-third of PVP-treated vertebral bodies (23/65).

Cohort studies have demonstrated that PVP can provide significant and rapid pain relief with relatively low complication rates of 1% to 10%.[11,12,16,28–31] Complications are minor, relatively infrequent, and usually transient; however, there are anecdotal reports of cord compression, transient worsening of pain, radicular pain, infection, adjacent vertebral fracture, and spinal cord compression.[32] Rarely, pulmonary or paradoxical cerebral arterial embolization from cement leakage into the epidural veins can occur.[33–35]

Extravertebral extrusion of polymethyl methacrylate (PMMA) is common, seen in up to 73% (29/40) of patients with metastatic disease.[36] Although this series reported 2 of 37 patients requiring decompression back surgery for significant nerve root compression, most series report no clinical sequelae of cement leakage. There is a reported higher complication rate of approximately 10% with pathologic fractures, often related to loss of the posterior vertebral cortex or displacement of tumour into the spinal canal. There is a lower complication rate of approximately 1% with osteoporotic fracture. We had 2 major complications, one in a pathologic fracture patient and one in an osteoporotic fracture patient. The first complication occurred in a patient with a vertebral osteoblastic metastasis that experienced extravasation of cement into the canal with cord impingement and mild sensory changes (posterior column deficit). Interestingly, the patient's back pain showed improvement immediately after the PVP. Her spinal canal was surgically decompressed the next day with no change in her mild sensory deficit. The second complication occurred in an osteoporotic patient who had intradiscal extravasation of cement resulting in a disc herniation and new radicular pain (Figure 2). We also had 2 cases of postoperative adjacent vertebral fractures that were treated successfully with a subsequent PVP. It is not clear whether these fractures were related to the observed cement leakage into the intervertebral disc space or to other unrelated factors.[37,38]

This study has several limitations, including a varied patient population, small sample size, and relatively short follow-up period. The varied patient population may have muddied the results; however, this allowed for a direct comparison of the differences in improvement between osteoporotic and pathologic fractures. It was also our goal to reflect the experience of a single operator in a Canadian tertiary care referral centre and the generalizability of the results across both patient populations. The small numbers of referrals generally include a high percentage of cancer patients and are typical of a Canadian centre.

That all the procedures were performed by a single operator may be considered a sampling limitation since these results may not be achievable by others. Nonetheless, excellent results can be achieved in competent hands.

The ESAS and TFAS were designed for the palliative patient population, and their generalizability to the osteoporotic population has not been validated.[19] PVP was in its infancy in Canada at the beginning of this study. At this time, we felt that most eligible patients would have pathologic fractures and decided that the best quality-of-life assessment scales would be those used in the palliative care patient population. Given our mixed population, we did not feel that osteoporosis assessments such as the Osteoporosis Quality of Life Questionnaire were appropriate. We also felt that our osteoporotic fracture patients would behave much like the palliative care population because of the selection criteria of intractable pain. The categorical data of the TFAS are also less precise when compared with the continuous data. The advantage of the above scales and of the SSPS is their simplicity, which allows us to use telephone follow-up instead of more problematic in-person follow-up sessions.[39] The simplicity of the verbal rating scale of the SSPS also saves time and compares favourably with the Visual Analog Scale for pain used in many vertebroplasty papers.[21]

A significant shortcoming of this study is the lack of a control group. Although we do not know for certain whether our patients would have improved without PVP, our inclusion criteria limited this possibility. For pathologic fractures, we included only those patients who had failed radiation therapy. Our osteoporotic fracture patients were all well beyond the normal healing time frame, including one patient who had experienced chronic pain for 5 years. Also, because of the difficulty in conducting them, the literature contains no controlled prospective trials.

In summary, PVP significantly improved patient perception of quality of life and function by markedly decreasing axial spinal pain. The almost immediate effects of PVP on symptoms and patient-derived quality-of-life assessments appeared to be sustained in early-term follow-up (12 weeks). Stratification by fracture type shows that patients with osteoporotic fractures performed better after PVP, on average, than did the patients with pathologic fractures. Although cement extravasation is a relatively frequent occurrence (55.6%), the risk of significant clinical sequelae is low. The long-term efficacy of the technique requires further study.

Evaluation of Vertebroplasty with a Validated Outcome Measure: The Roland-Morris Disability Questionnaire

Andrew T. Trout, David F. Kallmes, Leigh A. Gray, Barbara A. Goodnature, Sandra L. Everson, Bryan A. Comstock, and Jeffrey G. Jarvik

BACKGROUND AND PURPOSE: **Vertebroplasty is rapidly disseminating as a treatment for vertebral compression fractures, but its efficacy has not been assessed with a well-validated, back pain–specific instrument. We report the use of the Roland-Morris Disability Questionnaire (RDQ) in patients undergoing vertebroplasty for painful osteoporotic compression fractures.**

METHODS: **Retrospective review of patients treated with vertebroplasty who completed the RDQ and 2 verbal pain scales (0–10) for pain at rest and pain with activity at baseline, 1 week, 1 month, 6 months, and 1 year post-vertebroplasty. Changes in outcome measures were analyzed by using a paired *t* test and correlations were assessed with Spearman ρ. Multiple linear regression was used to analyze the relationship between baseline scores and independent variables.**

RESULTS: **One hundred thirteen patients were treated at 164 vertebral levels. At baseline, RDQ scores were associated with rest and activity pain ($P < .001$ and $P = .002$, respectively) but were not associated with other independent variables. All 3 outcome scores decreased by 1 week and remained improved through maximal follow-up ($P < .001$). RDQ scores improved by a mean of 7.0 points at 1 week and remained improved at 1 year ($P = .02$). RDQ scores correlated with both rest and activity pain, but the absolute correlation was slightly better (+0.15 on average) with activity pain.**

CONCLUSIONS: **Patients who underwent vertebroplasty experienced relief of back pain and symptoms, as shown by improvement in verbal pain and RDQ scores. The RDQ correlates well with measures of pain, shows clinically significant improvement and is responsive to changes across time. More important, the RDQ provides an easily administered, well-validated, back pain–specific outcome measure that could be adopted to assess vertebroplasty outcomes.**

First used in the United States in the 1990s, vertebroplasty has rapidly approached standard of care for treatment of medically refractory, painful vertebral compression fractures. Because of difficulties in study design and execution there have been no randomized, blinded, controlled studies comparing vertebroplasty to placebo or conservative therapies. Instead, investigators have sought to validate use of the procedure through changes in measures of perceived pain. These studies have shown significant improvement in pain and other symptoms as assessed by these instruments (1–3). There is no continuity, however, in the type of instrument used or the symptom variables that have been assessed in the vertebroplasty literature.

A critical review of the vertebroplasty literature reveals that, to this point, there exists a dearth of studies that have used validated outcome measures to assess the efficacy of this treatment. Visual analog scoring of perceived pain is the most common method of assessment. Although this addresses the patient's pain and provides a well-validated variable for assessment of pain control (4), this instrument fails to address the other symptoms and disabilities experienced by the patient. Because vertebroplasty aims at improving both the pain and disability experienced by the patient, both of these elements should be in-

cluded in outcome measures when determining treatment efficacy.

We report the application of a widely applied, back pain–specific, well-validated outcomes instrument, the Roland-Morris Disability Questionnaire (RDQ), to a consecutive cohort of patients undergoing vertebroplasty for the treatment of painful, osteoporotic compression fractures. In addition, we correlated the RDQ with 2 11-point graded pain scales and tracked these measures across time. We believe that the RDQ should be used as the primary outcome measure for vertebroplasty research and practice.

Methods

We performed a retrospective review of 113 patients who underwent vertebroplasty between April 21, 2003, and September 27, 2004, at our institution. Institutional review board approval was obtained for this study. Vertebroplasty typically was offered to patients with radiologic evidence of acute or subacute vertebral compression fractures of thoracic or lumbar vertebrae. Exclusion criteria included improvement with conservative management, technical contraindications, and noncorrelating pain. Patients included in this study were limited to those with compression fractures due to underlying osteoporosis.

Vertebroplasty Procedure

Vertebroplasties were performed by staff radiologists according to the methods outlined previously (5). Specifically, patients were treated by using intravenous conscious sedation. Biplane fluoroscopy was used in all cases. Local anesthesia was administered over the skin, subcutaneous tissues, muscular tissues, and periosteum of the targeted pedicle. Transpediculate or parapedicular trajectories were used in all cases. After local anesthetic administration, 11- or 14-gauge biopsy needles (Cook Inc., Bloomington, IN) were advanced into the central aspect of the vertebral bodies for unipediculate approaches, whereas placement of the needle was made into the midportion of the hemivertebra for bipediculate approaches.

The polymethylmethacrylate (PMMA) cement mixture was prepared under a vacuum hood. Approximately 30 g of PMMA powder (Codman Cranioplastic, Raynham, MA) was mixed with 12 g sterile barium sulfate (Cardinal Health, McGaw Park, IL) and 1 g gentamicin powder (Hawkins Inc., Minneapolis, MN). Liquid PMMA monomer was mixed with the powder mixture until the fluid reached a viscosity similar to that of cake glaze. The mixture was then loaded either into an injector device (Cook Inc.) or into 1-mL syringes and injected under continuous lateral and intermittent AP fluoroscopy. Cement injection was considered complete when the cement reached the posterior fourth of the vertebral body on the lateral projection. Injection was also terminated when epidural, venous, or transendplate extravasation was noted. Following needle removal, patients were left on strict bed rest for 1 hour and then discharged.

A maximum of 4 vertebral levels were treated in a single session based on clinician comfort levels. Additional levels were treated in repeat sessions as required.

Outcome Measures

The RDQ (appendix 1) and 2 verbal scales (scored 0–10) to assess "pain at rest" and "pain with activity" were administered in person by trained nurses at the time of evaluation for vertebroplasty. The original RDQ contained 24 questions and was derived from statements contained in the Sickness Impact Profile (6). Each question was selected on the basis of its likelihood of being influenced by back pain and the qualification "because of my back pain" was added to further target the responses (7). The modified RDQ used in this study is that proposed by Patrick et al (8) and contains 23 yes/no questions. Nineteen of these 23 items are taken from the original RDQ, and 4 were derived from other statements in the Sickness Impact Profile (8). These modifications were suggested by the authors in an effort to reduce redundancy and add in items that were previously shown to better reflect changes in patient condition (8). The modified instrument takes approximately 3 minutes to complete and can be self-administered or administered via the telephone. It is scored from 0 to 23 on the basis of the number of "yes" responses. The authors have demonstrated that the modified version had a high level of internal consistency, construct validity, and responsiveness (8).

Follow-up data for all 3 outcome scales were gathered by telephone by the same trained nurses at 1 week, 1 month, 6 months, and 1 year post-vertebroplasty. Patients who were telephoned 3 times, without successfully obtaining follow-up data, were designated as nonrespondents for that time period. Nonrespondent status at a given time point did not preclude contacting that patient at the next designated time point.

Statistical Analysis

Changes in pain scores across time were analyzed by using a paired t test comparison to the preceding time point. Correlation between outcome measures was assessed with the Spearman ρ correlation coefficient and differences in the strength of correlation were assessed through statistical bootstrapping of the data. Multiple linear regression was used to analyze the relationship between outcome scores and independent variables (age, sex, lumbar versus thoracic treatment, number of levels treated) at baseline and 1 week.

Results

Data were collected from 113 patients who underwent vertebroplasty at 164 vertebral levels. Compression fractures in this population were all osteoporotic in origin. The mean patient age at the time of the procedure was 74 years (range, 28–96 years). Ninety (80%) of the 113 patients were women. As of this study, 113 patients were immediately post-vertebroplasty, 108 (96%) patients 1 week post-vertebroplasty, 93 (82%) patients 1 month post-vertebroplasty, 52 (46%) patients 6 months post-vertebroplasty, and 19 (17%) patients 1 year post-vertebroplasty. RDQ scores were available for 108 (96%) patients at baseline, 93 (86%) patients at 1 week, 73 (79%) patients at 1 month, 46 (89%) patients at 6 months, and 15 (79%) patients at 1 year. Four patients were excluded at 1 year because of secondary injury or processes that may have skewed their RDQ scores. Three of the excluded patients had falls resulting in pelvic fractures in one and new vertebral fractures in another. The fourth patient was excluded because of a subsequent diagnosis of fibromyalgia as the cause of her pain.

All 3 outcome measures (rest pain, activity pain, and RDQ score) showed a significant decrease at 1 week ($P < .001$), with RDQ scores improving by a mean of 7.0 points. These improvements in all 3 outcome measures persisted through 1-year follow-up (Fig 1). Absolute values continued to decline at each time point, but the changes between time points were not statistically significant. There was a statistically

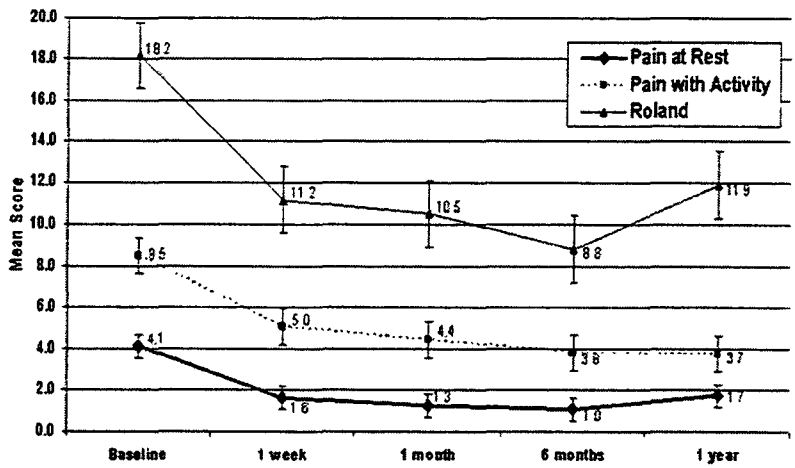

FIG 1. Mean RDQ and pain scores, with SDs, across follow-up. There is significant improvement in all 3 outcome measures at 1 week that persists throughout follow-up.

TABLE 1: Correlation between Roland score and pain scales at each time point throughout follow-up

	Pain at Rest	Pain with Activity
Baseline	0.30	0.47
1 week	0.57	0.52
1 month	0.44	0.40
6 months	0.31	0.63

TABLE 2: Linear regression of baseline Roland and pain with activity scores

Covariate	Roland	Baseline, Pain with Activity	Baseline, Pain at Rest
Baseline			
Pain with activity	<.001		.06
Pain at rest	.002	.06	
Roland score		<.001	.04
Age	.09	.58	.30
Sex (male)	.06	.20	.99
Level			
Lumbar	.50	.38	.12
Thoracic	.64	.29	.18
Number of levels treated	.45	.43	.35

Note.—Columns indicate *P* values.

significant increase in RDQ scores at 1 year (P = .003), but the score remained significantly improved over that at baseline (P = .02).

RDQ scores correlated with both rest pain and activity pain at all time points (Table 1). On average, the correlation between RDQ scores and activity pain scores was +.15 better than that with rest pain scores. This difference approached but did not reach statistical significance (P = .07).

Multiple linear regression analysis of outcome measures showed an association between baseline RDQ scores and baseline activity pain and rest pain (P < .001 and P = .002, respectively) but showed no significant correlation with other patient or procedural variables (Table 2). Scores at 1 week were not found to be associated with baseline scores or any of the other variables.

Discussion

Although vertebroplasty is rapidly disseminating as a treatment for vertebral compression fractures, the evidence for efficacy is weighed largely on symptomatic improvement in perceived pain from case series. Although pain control is an important element of vertebroplasty, the procedure is also designed to reduce disability in the treated individual. Few investigations have used validated outcome measures to address the impact of vertebroplasty on patient disability.

In the current study, we applied the RDQ to the practice of vertebroplasty. We selected the RDQ because it fulfills criteria that are important for outcome measures used to evaluate the efficacy of vertebroplasty: (1) back pain-specific measurement; (2) well validated in the literature; and (3) easily administered by telephone to elderly patients. The RDQ was specifically designed to assess physical disability due to lower back pain (6). In addition, this instrument was determined to be reliable and well validated when it was initially proposed and has been validated in many studies since that time (7, 9).

We showed substantial improvement in RDQ scores that persisted with time. Mean improvements were on the order of 7–9 points at all follow-up intervals. This level of improvement far exceeds the change of 2–3 points that is considered clinically important by the authors of the instrument (7). Further, we showed that RDQ scores correlate with the well-established 11-point verbal pain scales frequently used in the literature. Both RDQ scores and pain scale measurements improved significantly at 1 week and remained improved over baseline through 1-year follow-up. Last, we found the RDQ instrument to be highly user-friendly, generating acceptable response rates and facilitating telephone follow-up with vertebroplasty patients. These findings are relevant because they show that the RDQ is well suited to measure vertebroplasty outcomes as it is both sensitive to change across time and correlates well with the patient's level of pain and disability.

Previous authors have applied a variety of validated outcomes scales to vertebroplasty and have shown

TABLE 3: Results of previous outcome measure studies

Study	*n*	Instrument	Result
Zoarski et al (18)	30 patients, 54 fractures	MODEMS (includes SF-36)	Improvement in all 4 MODEMS modules ($P < .0001$, $P < .0001$, $P < .0004$, $P < .0009$)
Perez-Higueras et al (19)	13 patients, 37 fractures	McGill-Melzack Pain Questionnaire	Improvement in scores following treatment ($P < .001$), but worsening at follow-up (mean of 65 months)
Legroux-Gerot et al (12)	16 patients, 21 fractures	McGill-Melzack Pain Questionnaire	Decrease in scores at 6 months with no change through maximal follow-up (mean of 35 months) ($P < .05$)
		Nottingham Health Profile	Decrease in quality of life ($P = .05$); increase in social isolation ($P < .05$), otherwise no change
Cortet et al (20)	16 patients, 20 fractures	McGill-Melzack Pain Questionnaire	Decrease in score at days 3, 30, 90, and 180 (all $P < .005$)
		Health Profile	Decrease in 5 of 6 dimensions ($P < .001$, $P < .05$, $P < .05$, $P < .05$), not sleep
Winking et al (14)	38 patients	ODI	Decrease in mean score at day 2, which persisted to 6 weeks ($P < .01$)

Note.—MODEMS indicates Musculoskeletal Outcomes Data Evaluation and Management Scale; ODI, Oswestry Low Back Pain Disability Questionnaire.

improvement in measured disability and symptoms (Table 3). With the exception of the Oswestry Low Back Pain Disability Questionnaire (ODI), however, these instruments do not focus on the most relevant criteria in tracking outcomes in vertebroplasty patients. Back pain specificity is the most important of these criteria. Many of the patients who receive vertebroplasty have coincident health problems that influence their overall level of health and functioning. Back pain and symptom data that are gathered through global health measures are likely confounded by the influence of other health conditions on these assessments.

The SF-36, McGill Mezlack questionnaire, and Nottingham Health Profile were designed as generic measurements of health and are not specific to back pain (10–12). It is important to note that the RDQ shows more responsiveness to change than the SF-36 and thus may be more useful in assessing outcomes (13). Also the McGill Mezlack questionnaire is more complex than other instruments both to administer and to score.

The ODI might be considered to be the most appropriate instrument that has been previously used in the literature to assess outcomes after vertebroplasty. This instrument was specifically designed to describe back pain and disability and has been found to be both reliable and valid (7). It has also been effectively administered in person and by telephone. The only study in the literature to use the ODI in vertebroplasty outcomes assessment is the study by Winking et al (14), which enrolled 38 patients and tracked their outcomes for 1 year. The authors showed a significant decrease in ODI score 2 days postvertebroplasty that persisted unchanged to 6 weeks. Although ODI scores were tracked out to 1 year, statistics were only given on these data out to 6 weeks, and thus the authors could not comment on long-term outcomes.

Comparisons of the RDQ to the ODI have shown small but important differences. Stratford et al (9) found an increased rate of incomplete responses with the ODI when compared with the RDQ. This may be inherent in the instrument or may reflect the fact that the ODI has more questions specific to "sex life," "social life," and "travel," which may be less relevant in the day-to-day function of the elderly population. Regarding the applicability of the 2 instruments, Roland and Fairbank (7) concluded that the RDQ may be better suited to settings in which patients have mild to moderate disability that is expected to improve, whereas the ODI is suited to situations in which patients have persistent severe disability. These 2 conclusions lead us to believe that the RDQ is not only more appropriate in vertebroplasty patients who are expected to rapidly improve, but also may generate more complete responses and data.

In our practice, we have observed substantial clinical utility for the RDQ. Primarily, the RDQ is more useful than pain scores for assessment of the impact of vertebral fractures on the patient's daily life. Pain scores are influenced by the patient's perception and tolerance for pain and the reported value relates only loosely to functional limitation. The RDQ, however, gives care providers an objective assessment of the functional limitation suffered by the patient. This is useful both for the treating physician and for ancillary health staff. For the physician, thinking of RDQ scores in categories similar to those defined by Patrick et al (8)—10.8 = low; 15.7 = mild; 17.5 = moderate; 19.0 = severe—allows informal categorization of the severity of the patient's impairment and provides some basis for treatment and management decisions. For ancillary health staff, specific limitations indicated in the RDQ can provide a basis for physical/occupational therapy or other directed lifestyle interventions. Finally, tracking both specific items on the RDQ and the RDQ score in general, allows effective monitoring of a patient's progress following vertebroplasty.

Although our study is the first to apply the RDQ to

vertebroplasty patients and the first to show long-term improvement in a validated, back pain–specific outcome measure, several substantial limitations remain. This study was both retrospective and lacking a control group. Ultimately, to validate the efficacy of vertebroplasty, prospective controlled studies are needed to show significant improvement over conservative management (15). Another potential limitation to this study is that follow-up was done by telephone. Although we felt that one of the characteristics of a good outcome measure was ease of telephone administration, other investigators argue that administering an instrument by telephone introduces a bias to the data (16, 17). This is a valid concern, but the increased response rates and the ability for fragile and significantly disabled patients to complete the instrument outweigh the potential bias. In addition, we took steps to minimize this bias by having designated vertebroplasty nurses administer the RDQ in person and by telephone according to a strict protocol. The low response rate at 1 year is also problematic, with only 17% of subjects achieving that duration of follow-up by the time of this study. On the basis of the small data set, the results for 1 year may be less reliable than those at earlier time points. Finally, a potential issue with our data collection is that our nonrespondents were not carefully tracked. For the purpose of outcomes data, it would be useful to differentiate between patients who were unwilling or unable to complete the instrument versus those who were simply lost to follow-up.

This study undertook to address an underlying deficiency in the vertebroplasty literature and demonstrate the use of a validated outcome measure. It provides useful and valid data about vertebroplasty outcomes but does not preclude the necessity to undertake additional prospective, controlled studies. If we are to draw larger conclusions across studies and populations, it is important that we standardize our outcome assessments.

Conclusion

Patients undergoing vertebroplasty for osteoporotic compression fractures had less pain and symptoms after the procedure. On the basis of background data and the results of this study, the RDQ appears well suited as a standardized measure of the efficacy of vertebroplasty. It is longitudinally validated and back pain–specific, and we have shown it to be effective in assessing outcomes following vertebroplasty. It is our assertion that the RDQ should be adopted as the outcome measure of choice to monitor the long-term efficacy of vertebroplasty.

Appendix 1

Modified RDQ (6, 8)

When your back hurts, you may find it difficult to do some of the things that you normally do. This list contains sentences that people have used to describe themselves when they have back pain. When you read them, you may find that some stand out because they describe you *today*. As you read the list, think of yourself *today*. When you read a sentence that describes you today, put a tick against it. If the sentence does not describe you, then leave the space blank and go on to the next one. Remember, only tick the sentence if you are sure it describes you today.

1. I stay at home most of the time because of my back
2. I change position frequently to try and get my back comfortable
3. I walk more slowly than usual because of my back
4. Because of my back I am not doing any of the jobs that I usually do around the house
5. Because of my back, I use a handrail to get upstairs
6. Because of my back, I have to hold on to something to get out of an easy chair
7. I get dressed more slowly than usual because of my back
8. I only stand up for short periods of time because of my back
9. Because of my back, I try not to bend or kneel down
10. I find it difficult to get out of a chair because of my back
11. My back is painful almost all the time
12. I find it difficult to turn over in bed because of my back
13. I have trouble putting on my sock (or stockings) because of the pain in my back
14. I only walk short distances because of my back pain
15. I sleep less well because of my back
16. I avoid heavy jobs around the house because of my back
17. Because of my back pain, I am more irritable and bad tempered with people than usual
18. Because of my back, I go upstairs more slowly than usual
19. I stay in bed most of the time because of my back
20. Because of my back problem, my sexual activity is decreased
21. I keep rubbing or holding areas of my body that hurt or are uncomfortable
22. Because of my back, I am doing less of the daily work around the house than I would usually do
23. I often express concern to other people about what might be happening to my health

BACKGROUND AND PURPOSE: Percutaneous polymethylmethacrylate (PMMA) vertebroplasty has become a common procedure for treatment of pain and disability associated with vertebral compression fractures. We reviewed the experience with our first 1000 consecutively treated vertebral compression fractures in an attempt to demonstrate both the short- and long-term safety and efficacy of percutaneous vertebroplasty.

MATERIALS AND METHODS: The first 1000 compression fractures treated by vertebroplasty at our institution were identified from a comprehensive prospectively acquired vertebroplasty data base. All patients treated with vertebroplasty were included, regardless of the underlying pathologic cause. Chart reviews of the procedure notes, imaging studies, clinical visits, and follow-up telephone interviews were performed for each patient. Evaluation at each follow-up time point included pain response (subjective and visual analog pain score), change in mobility, change in pain medication usage, and modified Roland-Morris Disability Questionnaire. Statistical analysis was performed on the pain response and change in the Roland-Morris score at each follow-up time point. Significant procedure-related complications that occurred from the time of the procedure were also specifically extracted from the patients' charts.

RESULTS: There was a dramatic improvement in all the evaluated parameters following percutaneous vertebroplasty. The improvement in pain, mobility, medication usage, and Roland-Morris score was noticed immediately after the procedure and persisted through the 2-year follow-up. There was a low rate of complications from the procedure, the most common being rib fractures.

CONCLUSION: According to our results, practitioners can quote a high success rate and low complication rate for vertebroplasty when making treatment recommendations for painful spinal compression fractures.

Vertebral compression fractures are a common cause of pain and disability.[1-5] There are many causes of vertebral compression fracture, including osteoporosis, trauma, and neoplasm. Osteoporosis among postmenopausal women and patients on long-term steroid therapy are the most frequent causes.[6-8] Percutaneous polymethylmethacrylate (PMMA) vertebroplasty was introduced in the United States approximately 10 years ago, and since that time, it has become the standard of care for treatment of medically refractory vertebral compression fractures.[9]

Conservative management of compression fractures has traditionally included analgesics, braces, immobilization, and physical therapy.[10-14] In its infancy, vertebroplasty was often deferred in favor of medical management to spare patients from a potentially risky procedure. However, bed rest and heavy narcotic usage carry a significant set of risks that are potentially avoided with early treatment, and practitioners are performing the procedure earlier as they become more experienced.

The literature contains many small case series on the effectiveness of percutaneous vertebroplasty.[15-20] Most of these reports are confined to the treatment of osteoporotic compression fractures and contain a limited evaluation of follow-up results. We provide a comprehensive review of the experience with vertebroplasty at a large academic center and evaluate multiple outcome measures over both short- and long-term follow-up periods.

Materials and Methods

Patient Population

There were 552 patients treated between February 1999 and October 2005. These 552 patients underwent 673 sessions to treat 1000 spinal compression fractures. Sixty-three percent of the treatment sessions (425/673) involved treatment of a single level, whereas 27% (180/673) involved 2 levels, 9% (58/673) involved 3 levels, and 1% (9/673) involved 4 levels. A single case involved treatment of 5 levels, but there were no cases in which treatment of more than 5 fractures was performed in a single session. The average age of patients in our study was 74 years (SD, 10.8 years) with a range of 28–96 years. As expected, a significant percentage of the patients were women. Sixty-nine percent (379/552) were women, whereas 31% (173/552) were men.

Selection Criteria

Institutional review board approval was granted for this study. Vertebroplasty was offered to patients with imaging evidence of an acute or subacute compression fracture of the thoracolumbar spine. Patients with all causes of compression fracture were included in the study. Exclusion criteria for vertebroplasty typically included response to medical management, noncorrelating pain, systemic or spi-

nal infections, and technical factors such as gracile pedicles or vertebra plana. Patients with other causes for pain such as disk herniation, spinal stenosis, or foraminal narrowing were also excluded unless a coexistent compression fracture was thought to contribute significantly to their symptoms. Although most patients were treated initially with conservative medical management, inpatients with intractable pain were offered the procedure earlier than those with pain of less severity. Even patients with prolonged symptoms occurring for many months were offered vertebroplasty if they had correlating pain with evidence of an unhealed fracture. An unhealed fracture was diagnosed if there was persistent edema on MR imaging or corresponding radiopharmaceutical uptake on bone scintigraphy studies. Rarely, patients without vertebral edema on MR imaging or radiopharmaceutical uptake were considered to have an unhealed fracture if there was focal pain with palpation at fluoroscopy corresponding to a known vertebral compression fracture. The average duration of symptoms before treatment was 3.6 months.

Vertebroplasty Procedure

All vertebroplasty procedures were performed by neuroradiologists with expertise in spinal interventions. A preprocedure consultation was performed by a neuroradiologist usually within a few days of the procedure, and this consultation included a focused physical examination with fluoroscopic confirmation of correlating pain. Depending on the patient's underlying medical condition, procedures were performed with the patient under conscious sedation, deep sedation, or general anesthesia. Conscious sedation consisted of intravenous fentanyl and midazolam and was usually begun before placing the patient prone on the fluoroscopy table. Biplane fluoroscopy was used in all cases. After placing the patient prone on the table, we confirmed the fractured level with previously obtained imaging studies and the level to be treated was localized by counting from above and below. Local anesthetic consisted of subcutaneous 1% lidocaine and 0.25% bupivacaine into the deep soft tissues and periosteum with a 22-gauge spinal needle. An 11- or 13-gauge needle with an inner stylet was then advanced under fluoroscopic guidance by using a transpedicular or parapedicular approach into the vertebral body. When the needle was at the junction of the pedicle and body, a biplane digital radiograph was obtained to confirm an appropriate trajectory and exclude a breech of the medial pedicle. The needle was then advanced into the anterior one third of the vertebral body in an attempt to reach the midline. At this point, biplane images were again obtained before PMMA injection. Under a vented hood, a mixture of PMMA, barium, and 1 g of gentamicin was prepared. The cement was injected with an injection device or with 1-mL syringes under biplane fluoroscopic observation until it reached the posterior one fourth of the vertebral body.

The injection was terminated if venous, disk space, or epidural extravasation was encountered. If inadequate filling of the contralateral hemivertebra was noted, a 2nd needle was placed into the contralateral side and additional cement was injected. Patients were instructed to remain supine for 2 hours after the procedure to allow for cement hardening and resolution of sedation. After 2 hours of bed rest, they were evaluated at the bedside and were allowed to ambulate. Outpatients were then discharged, whereas inpatients were allowed to ambulate as tolerated. Up to 5 levels were treated at a single session in the early days of our practice. However, we now typically bring patients back for a 2nd procedure if more than 3 fractures need treatment.

Outcome Measures

At the time of the preprocedure consultation, patient mobility, pain medication usage, visual analog pain scale (0–10) at rest and with activity, and a modified Roland-Morris Disability Questionnaire score were obtained by trained vertebroplasty nurses and neuroradiologists. The Roland-Morris scale was routinely instituted in our practice halfway through the study period because of its specificity in evaluating patients with compression fractures.[21] The visual analog scale was answered in the standard fashion, with 0 being no pain and 10 being the worst pain ever experienced. Preprocedure pain medication type (narcotic versus nonnarcotic), frequency, and route (oral versus intravenous) were recorded. Two hours after vertebroplasty, patients were examined and a visual analog pain score was obtained at rest and with activity. Follow-up telephone interviews were conducted by vertebroplasty nurses at 1 week and 1, 6, 12, and 24 months postprocedure. The inability to contact a patient for 1 time point did not preclude contact at later follow-up time points. Data recorded from the follow-up telephone interviews included subjective and visual analog pain scores at rest and with activity, Roland-Morris score, changes in medication use and mobility, and any complications or new fractures that were encountered.

Statistical Analysis

Statistical analysis was applied to the visual analog pain scores at rest and with activity as well as to the Roland-Morris score response. A nonpaired 2-tailed *t* test was applied to each follow-up time point to assess the significance of pain response and improvement in the Roland-Morris score.

Results

General Patient Characteristics

In the course of our study, 1000 thoracolumbar vertebral compression fractures were treated during 673 procedures in 552 patients. The average cement volume injected was 3.3 mL per level. Conscious sedation was used in 85% (574/673) of patients, with general anesthesia in 12% (79/673) and deep sedation in 3% (20/673). Most of the patients who underwent general anesthesia did so early in the course of the study (Fig 1). As we became more experienced with the procedure, patients were more likely to be treated under conscious sedation. There was a slight decrease in the number of procedures performed during the last year of the study. This is explained, in part, by the inclusion of only 10 months of data during 2005. Additionally, we have recently noticed a small decrease in our vertebroplasty volumes as the procedure is increasingly performed at more institutions. Patients who were referred to our institution early in the course of our study are now more often treated locally as experience with the procedure expands.

Eighty-four percent (562/673) of procedures were performed for compression fractures related to osteoporosis. Compression fractures related to neoplastic involvement were the next most common and accounted for 11% (74/673) of procedures. The remaining 5% (37/673) of patients had fractures caused by hemangiomas or trauma. Although osteoporosis was the most common cause of vertebral compression fracture in both sexes, neoplastic fractures were a more common cause in men (17%) compared with women (8%). Similar to previously reported case series, vertebral compression fractures occurred more commonly at the thoracolumbar

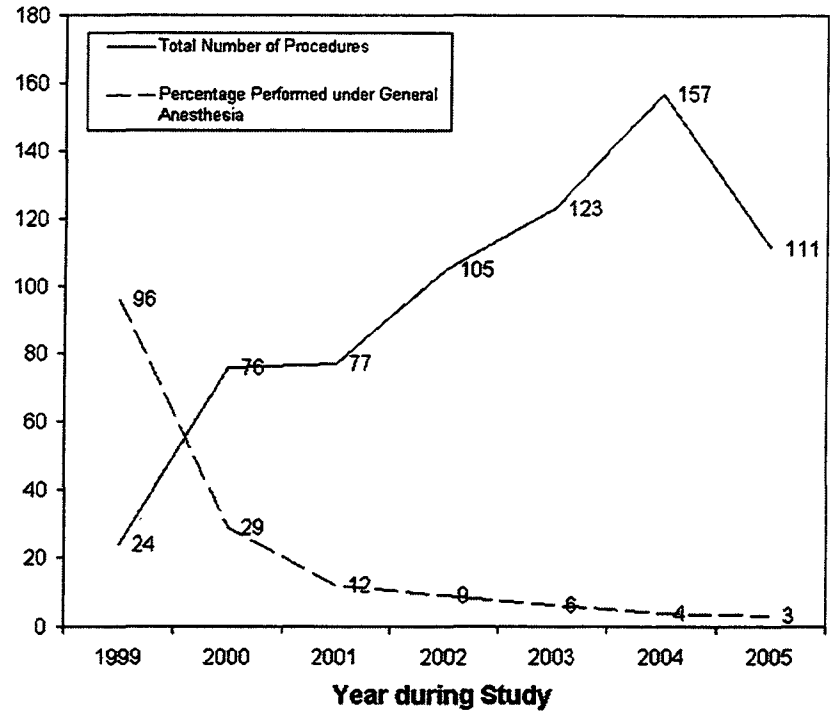

Fig 1. Number of procedures performed with the patient under general anesthesia with time

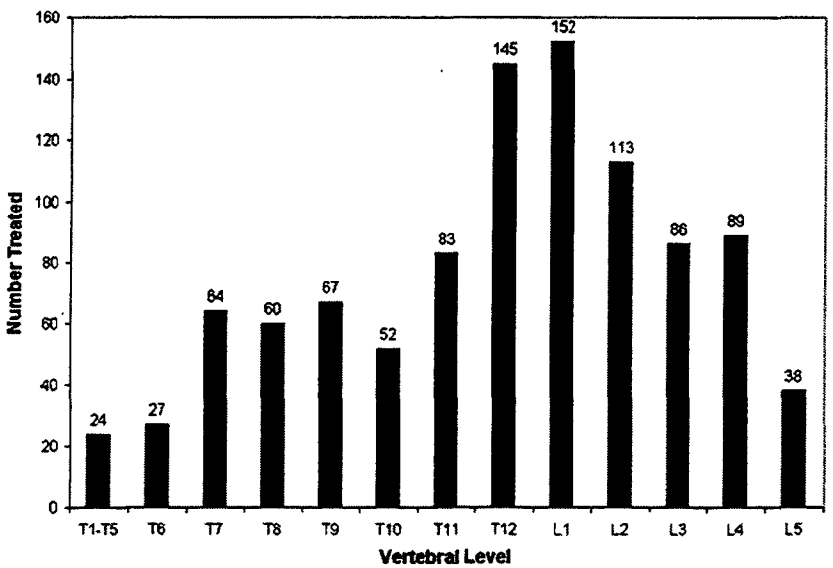

Fig 2. Distribution of treated compression fractures

junction, with T12, L1, and L2 accounting for 41% of treated levels (Fig 2).[22] To obtain a tissue diagnosis for a vertebral compression fracture, we performed a percutaneous biopsy in 9% (61/673) of patients before injection of PMMA. Seventy-nine percent (534/673) of patients underwent vertebroplasty as an outpatient procedure, and 21% (139/673) of procedures were performed on inpatients.

Twenty-three percent of the procedures (156/673) were followed by a new compression fracture or fractures, whereas 77% (517/673) did not develop a new fracture. Of the 156 new fractures, 106 (68%) underwent another vertebroplasty procedure.

Outcome Measures

Compared with the preprocedure visual analog pain score, a significant decrease in pain was seen at rest and with activity. The pain response was apparent at the 2-hour postprocedure evaluation and persisted for every follow-up time point up to 2 years (Fig 3). Similarly, there was a significant improvement in the Roland-Morris score that was apparent at the 1-week follow-up, and this was sustained throughout the 2-year follow-up period (Fig 4). Of significance, the decrease in visual analog pain score and the Roland-Morris score was highly statistically significant at every follow-up time point, with a P value of $<.001$. In our patient population, we had a relatively high rate of follow-up. We were able to obtain follow-up assessments in 89%, 84%, 75%, 67%, and 62% of patients at 1 week and 1, 6, 12, and 24 months, respectively. Most patients also reported an improvement in their mobility, a decrease in pain medication usage, and a qualitative decrease or complete resolution of their pain throughout the 2 years of follow-up (Table). Occasionally, patients reported no change in their

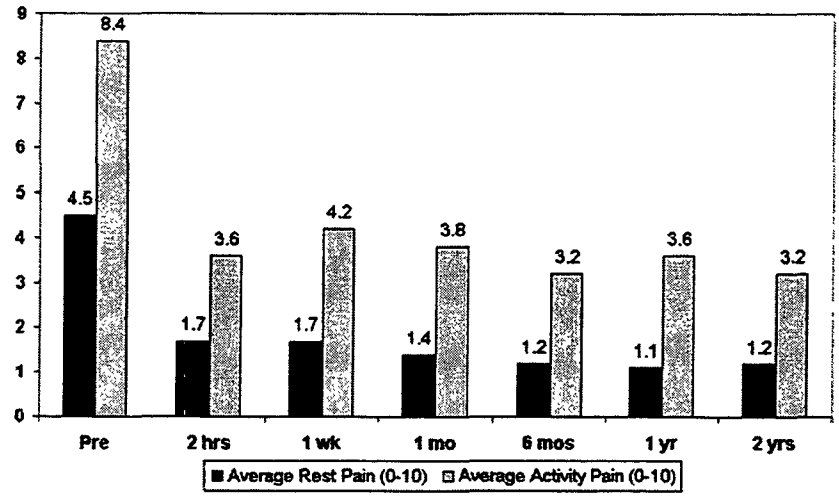

Fig 3. Pain relief following vertebroplasty by using the visual analog pain scale

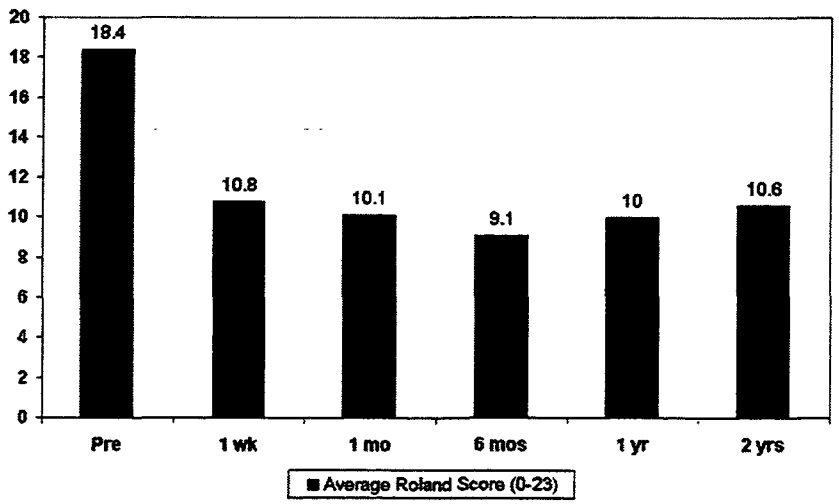

Fig 4. Comparison of the average Roland-Morris score before and after vertebroplasty.

Percentage of patients with improvement in mobility, pain medication usage, and subjective pain after vertebroplasty

	1 week	1 month	6 months	1 year	2 years
Mobility	76%	77%	78%	79%	76%
Medication usage	66%	69%	75%	79%	78%
Pain at rest	87%	87%	88%	87%	91%
Pain with activity	87%	85%	87%	82%	87%

pain at the initial 2-hour follow-up examination. We specifically evaluated this subset of patients to determine what their pain response was at later follow-up time points. Despite reporting no pain relief or worsening of pain at the 2-hour follow-up, most of these patients did get eventual pain relief as demonstrated by a similar decrease in visual analog pain scale at the 1-week through 2-year follow-up time points when compared with that of the entire patient population (Fig 5).

Complications

Clinically significant complications were encountered in only 12 patients (1.8%). Rib fractures related to lying prone on the fluoroscopy table for the vertebroplasty procedure were the most common complication encountered and occurred in 7 patients (1%). Any patient with focal chest wall pain that occurred after the procedure and was clinically referable to the ribs was considered to have a fracture, even if rib radiographs could not confirm a definite fracture. Therefore, it is possible that some of the rib fracture complications recorded could have been related to muscle pain rather than an actual fracture. A single patient was noted to have a transverse process fracture on the side of vertebroplasty needle placement that resulted in 2 weeks of paraspinal pain.

One patient had a clinically significant cement pulmonary embolus. This small embolus was immediately recognized because it occurred during the cement injection, resulting in termination of further cement injection. The patient reported pleuritic chest pain after the procedure and became dyspneic. Although a chest CT did reveal a cement pulmonary embolus, there were no long-term sequelae and the patient made a full recovery.

Five patients had new-onset radiculopathy in our study. However, 3 of these incidents were transient and without a radiographically identifiable cause, and only 2 clinically significant radiculopathy complications were encountered. In these 2 patients, the radiculopathy persisted for several months, and there was radiographic evidence for cement in or very near the neural foramen at the treated level.

A single patient had central spinal canal compromise in a neoplastic fracture. The posterior cortex of the vertebral body was disrupted on a preprocedure CT scan. Although cement

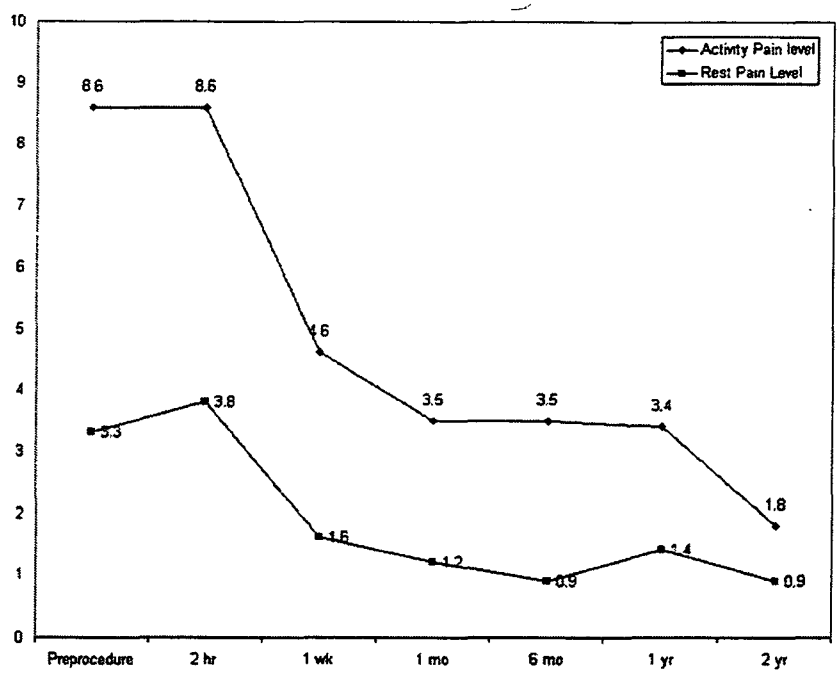

Fig 5. Visual analog pain score changes in the subset of patients who did not experience any pain relief at the 2-hour postprocedure evaluation. Despite no pain relief at 2 hours, these patients experienced significant pain relief at the remaining follow-up time points up to 2 years.

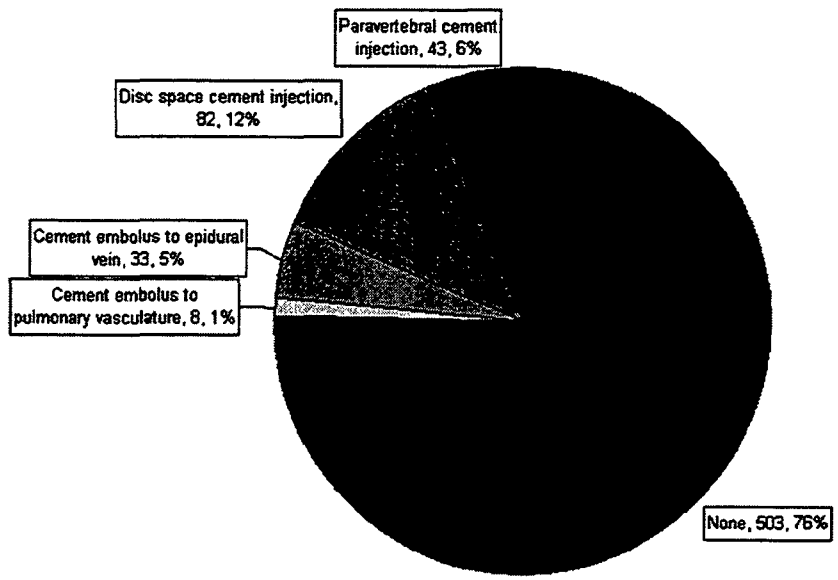

Fig 6. Distribution of cases with cement leakage outside the vertebral body.

was cautiously placed in the vertebral body and no extravertebral leakage was observed, the patient became symptomatic after the procedure, with evidence for neural compression. A postprocedure CT demonstrated interval posterior displacement of tumor into the canal, which required surgical decompression.

Of significance, no infectious complications were encountered in our study population, and no deaths were attributable to the vertebroplasty procedure.

Although we do not consider minimal asymptomatic extravertebral cement extravasation to be a complication of vertebroplasty, any aberrant cement placement during the procedures was recorded. Cement leakage into paravertebral veins, epidural veins, intervertebral disk space, and pulmonary vasculature was encountered in 170 patients (25%). There were 8 patients with cement leakage, with migration of a small amount of cement to the pulmonary vasculature. However, only 1 of these patients (discussed previously) became symptomatic. In the remaining 7 patients, there was no change in pulse oximetry readings or clinical status. This was likely due to the immediate recognition of cement extravasation and termination of injection. In 503 procedures (76%), no aberrant cement placement was encountered (Fig 6).

Discussion

Our study addressed both the short- and long-term outcomes for patients treated with vertebroplasty for vertebral compression fractures of all causes. In our study, most of the patients undergoing vertebroplasty were women, and the most common cause for vertebral compression fracture was osteoporosis. We found an immediate improvement in the degree of pain after vertebroplasty that was present even at the 2-hour postprocedure follow-up evaluation. This improvement in pain continued for all follow-up time-points up to 2 years and

was accompanied by a similar improvement in spine-related disability, mobility, and pain medication usage.

There was a low complication rate in our study, and no procedure-related infection or death was encountered. All of the complications that we encountered have been described in previous vertebroplasty case reports.[9,23,24] Rib fractures occurring at the time of vertebroplasty accounted for most of our complications and are not surprising given that the patients who undergo vertebroplasty procedures are predisposed to rib fractures. In fact, many patients who were treated with vertebroplasty were noted to have rib fractures from minor trauma present before the procedure. We began performing percutaneous vertebroplasty in 1999, and much of our early experience was gained at a time when vertebroplasty literature was sparse and techniques were still evolving. Because we included the procedures at the beginning of our experience, the complication rate for vertebroplasty would be expected to decrease even further because of the experience we have gained with our first 1000 levels.

To our knowledge, this is the largest reported comprehensive series on the outcomes related to percutaneous vertebroplasty. Previous articles on vertebroplasty outcomes have focused on specific etiologies such as osteoporosis or neoplasm. We reported on our experience with vertebroplasty in all patients, regardless of the underlying pathologic process. Patients in our study were followed up at specific intervals that included both short-term 2-hour evaluation and long-term 2-year follow-up interviews. This consistent extended follow-up allowed us to document both the short- and long-term outcomes associated with vertebroplasty and a sustained response to treatment. In an attempt to accurately document the complication rate of vertebroplasty, we performed a thorough chart review. Besides evaluating the radiology reports and radiology department follow-ups, we also reviewed all clinical follow-up visits with all clinical care providers in our institution. This was easily performed because of a systematic electronic medical record at our institution that includes all follow-up contacts, either in person or by telephone. Such a rigorous follow-up is needed to document completely all potential complications.

There are numerous outcome measures recorded in the vertebroplasty literature that attempt to validate this procedure in the treatment of vertebral compression fractures. However, there is significant variability in the outcome measures used to assess the viability of vertebroplasty. The most commonly reported measure is the visual analog pain score, which does provide important information to practitioners. However, relying on pain alone as an outcome measure fails to assess completely the adequacy or inadequacy of vertebroplasty for treating compression fractures. In a report by Trout et al, [21] the importance of a comprehensive tool for spine-related disability, the Roland-Morris Disability Questionnaire, was documented. Any assessment of vertebroplasty should include an analysis of spine-specific measures of pain and disability. Our study incorporated the Roland-Morris Disability Questionnaire and an assessment of mobility and pain medication usage in a large number of patients.

Reported complication rates from percutaneous vertebroplasty have been low.[9,17,25,26] Even with an extensive review of the patients' charts in our study, we report a clinically significant complication rate of only 1%–2%. The low complication rate in our series is likely related to the expertise and subspecialization of the operators. All of the procedures included in our study were performed by neuroradiologists with a specific interest in spine intervention. Epidural, paraspinal, intradiskal, and venous cement extravasation rates for percutaneous vertebroplasty are relatively high and have been documented to occur in up to 88% of patients.[27-30] In our study, 25% (170/673) of patients had some form of cement leakage documented. The documented cases of cement leakage in our study were based on fluoroscopically visualized cement outside the vertebral body at the time of the procedure. Our patients do not routinely undergo CT evaluation afterward, but this percentage would likely be higher if CT were performed to detect smaller areas of cement extravasation. On the basis of our and others' results, it is apparent that small amounts of cement leakage alone should not be considered a complication of vertebroplasty. It is important to recognize cement leakage during the procedure so that it can be terminated or the contralateral pedicle entered, but cement leakage should be considered a stopping point for injection rather than a complication. Despite a cement leakage rate of at least 25% in our series, the clinically significant complications related to cement leakage occurred in only 3 patients (0.45%) and included 2 patients with radiculopathy and a single cement pulmonary embolus. Therefore, claims that kyphoplasty is safer than vertebroplasty because of a decreased rate of cement leakage are unfounded.[31,32]

Our study has several limitations. Although we report on a large patient population with consistent outcome measures, our study is a retrospective review of a prospectively acquired data base. As with most studies on vertebroplasty, there is a potential for bias when patients are evaluated at follow-up. It is possible that the nurse or physician administering the follow-up questions could unintentionally influence the responses that patients gave, depending on how the questions were asked. Because many of the patients were older and resided in nursing homes, it is possible that responses to the follow-up questions were occasionally provided by family members or healthcare providers who interacted with the patients on a daily basis. In those cases in which the patient was unable to give responses to the follow-up questions because of disability or dementia, the responses recorded on follow-up from a surrogate interviewee may not accurately reflect the response intended by the patient. Although we did include responses from surrogate interviewees during follow-up interviews, these responses were limited to a basic assessment of pain, mobility, and medication usage. Surrogate responses were not recorded for the quantitative visual analog pain scores or Roland-Morris Disability Questionnaire.

Although vertebroplasty is considered to be the treatment of choice for painful vertebral compression fractures by many physicians, it has yet to be validated by a prospective randomized study. There are randomized prospective studies currently underway in the United States and internationally, such as the Investigational Vertebroplasty Efficacy and Safety Trial (INVEST), that will address this shortfall in the current vertebroplasty research.[33] It is only after the results of these studies are available that we can unequivocally state that vertebro-

plasty has been validated as a treatment option for patients with painful compression fractures.

Conclusion

On the basis of our results, percutaneous PMMA vertebroplasty is a safe and effective method to treat vertebral compression fractures. An immediate improvement in pain can be expected for most patients, and disability, mobility, and pain medication use are improved during the short- and long-term periods. The complication rate of vertebroplasty is low, with rib fractures being the most common clinically significant complication.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from the Five Year Review

February 2009

Foot Bone Resection Partial

CPT codes 28120, *Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (eg, osteomyelitis or bossing); talus or calcaneus* and 28122, *Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (eg, osteomyelitis or bossing); tarsal or metatarsal bone, except talus or calcaneus* were identified by the Five-Year Review Identification Workgroup as potentially misvalued through its Site of Service Anomaly screen in September 2007. The Workgroup reviewed all services that include inpatient hospital visits within their global periods, but are performed less than 50% of the time in the inpatient setting, according to recent Medicare utilization data. The RUC originally recommended a two-step action. First, the RUC removed the hospital visits from the service with no impact on the associated work RVU. Second, the RUC recommended that services be surveyed. At the April 2008 RUC Meeting, the specialty societies presented data that indicated that although these procedures are reported as outpatient procedures more than 50% of the time, patients typically spend at least one night in the hospital. The RUC deferred action on these issues until an adequate survey instrument was developed. The RUC approved a revised survey instrument in October 2008 and these procedures were surveyed for review at the February 2009 RUC Meeting.

1700

28120
The RUC first considered the compelling evidence presented by the specialty societies to review the work of 28120. The specialty societies indicated that during the Harvard studies, the wrong specialty was surveyed. The original surveys included only orthopaedic surgeons; however, podiatrists are the primary providers. Further, there is a rank order anomaly between 28120 and 28122. Currently, 28122 requires less physician time, but has a higher work RVU. **The RUC agreed that compelling evidence exists to consider revaluation of the work RVU of 28120.**

The specialty societies presented the results of a survey of 52 orthopaedic surgeons and podiatrists. 65% of the survey respondents indicated that patients spend at least one night in the hospital and are seen post-operatively by the physician on the same day of surgery following the procedure. The RUC agreed that the inclusion of one 99231 hospital visit was appropriate. The RUC also agreed with the two 99213 and three 99212 post-operative office visits as indicated by the surveyees. The RUC understands that the first two visits include a splint/bandage change. The physician continues to see the patient once per week until the wound heals and physical therapy

begins. The RUC reviewed the physician time and noted that the pre-service positioning time should be reduced to 10 minutes to more accurately reflect the service. Lastly, the RUC discussed the proposed work RVU and agreed with the survey 25th percentile work RVU of 8.08. The RUC compared this service to several other codes to support the work RVU including, 15100, *Split-thickness autograft, trunk, arms, legs; first 100 sq cm or less, or 1% of body area of infants and children (except 15050)* (work RVU = 9.74, pre-service = 65, intra-service = 60, post-service = 20) and 29891, *Arthroscopy, ankle, surgical, excision of osteochondral defect of talus and/or tibia, including drilling of the defect* (work RVU = 9.47, pre-service = 50, intra-service = 60, post-service = 25). The RUC compared 28120 to 49505, *Repair initial inguinal hernia, age 5 years or older; reducible* (work RVU = 7.88) and noted that the codes are similar, but that 28120 requires greater intensity and complexity. The RUC also agreed that the work RVU of 8.08 corrects an existing rank order anomaly with 28122, which has a work RVU of 7.56. **Therefore, the RUC recommends the survey 25th percentile work RVU of 8.08 for CPT code 28120.**

28122

The RUC first considered the compelling evidence presented by the specialty societies to review the work of 28122. The specialty societies indicated that during the Harvard studies, the wrong specialty was surveyed. The original surveys included on orthopaedic surgeons; however, podiatrists are the primary providers. Further, there is a rank order anomaly between 28120 and 28122. Currently, 28120 requires greater physician time, but has a lower work RVU. **The RUC agreed that compelling evidence exists to consider revaluation of the work RVU of 28122.**

The specialty societies presented the results of a survey of 52 orthopaedic surgeons and podiatrists. 67% of the survey respondents indicated that patients spend at least one night in the hospital and are seen post-operatively by the physician on the same day of surgery following the procedure. The RUC agreed that the inclusion of one 99231 hospital visit is appropriate. The RUC also agreed with the two 99213 and two 99212 post-operative office visits as indicated by the surveyees. The RUC reviewed the physician time and noted that the pre-service positioning time should be reduced to 10 minutes to more accurately reflect the service. Lastly, the RUC discussed the proposed work RVU and agreed that there is no compelling evidence to change the work RVU from its current value, which is 7.56. The RUC compared this service to several other codes to support the work RVU including, 33207, *Insertion or replacement of permanent pacemaker with transvenous electrode(s); ventricular* (work RVU = 8.00, pre-service = 47.5, intra-service = 60, post-service = 30) and 49505, *Repair initial inguinal hernia, age 5 years or older; reducible* (work RVU = 7.88, pre-service = 50, intra-service = 70, post-service = 20). The RUC also agreed that maintaining the current work RVU of 7.56 is appropriate in relation to its recommendation for 28120. **Therefore, the RUC recommends the maintaining the current work RVU of 7.56 for 28120.**

Practice Expense
The RUC recommends that the non-facility practice expense inputs be modified to reflect changes to the post-operative office visits and that the physician-assist time be modified to reflect changes to the intra-service time.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
28120		Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (eg, osteomyelitis or bossing); talus or calcaneus	090	8.08
28122		tarsal or metatarsal bone, except talus or calcaneus	090	7.56 (No change)

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old insulin-dependent diabetic female presents with a chronic, trophic ulcer on the posterior aspect of her right heel. A sinus tract leads to the calcaneus, and bone scans are positive for osteomyelitis. She requires resection of the posterior-inferior aspect of the right calcaneus.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

Percent of survey respondents who stated they perform the procedure; In the hospital 87% , In the ASC 13%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 16% , Kept overnight (less than 24 hours) 18% , Admitted (more than 24 hours) 67%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 88%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: • Select and order the appropriate antibiotic(s) and confirm timing and administration.

- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Review results of preadmission testing including labs, X-rays, CT scans, bone scan, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient prone positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- The leg is prepped and draped.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, two semi-elliptical incisions are made on the posterior aspect of the right heel, encompassing a 1 cm diameter ulcer. The insertion of the Achilles tendon is identified and protected. Using bone rongeurs and bone curettes, a portion of the posterior-inferior aspect of the calcaneus is resected and sent for culture and pathology. The remaining healthy bone is rasped smooth. The wound is inspected and irrigated. The wound is packed open.

Description of Post-Service Work:
Post-service work: in facility

- Application of a dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient is discharged to the orthopaedic floor for overnight observation to monitor wound, anticoagulation

The physician visits the patient on the floor that evening.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Orders are written for evaluation of periodic imaging and laboratory reports; review of anticoagulation laboratory values and appropriate medication adjustment, and antibiotic and pain medication adjustments
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order physical therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

SURVEY DATA

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

We believe that codes 28120 *Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bon (eg, osteomyelitis or bossing); talus or calcaneus* and 28122 *Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (eg, osteomyelitis or bossing); tarsal or metatarsal bone, except talus or calcaneus* need to be considered together because they have similar and overlapping arguments for review, including wrong specialty surveyed and rank order anomaly.

Both were brought forward by the RUC through the 5-Year Review ID workgroup as part of the site-of-service anomaly review. Both codes were then surveyed for the February 2008 RUC meeting but were postponed for review until the April 2008 RUC meeting. At the April RUC meeting, the AAOS, AOFAS, and APMA presented the two codes for RUC review with a recommendation for an increase in value. At the April 2008 RUC meeting the RUC heard the compelling evidence argument by the presenters and voted to accept the compelling evidence and to allow the presenters to recommend an increased value. However, the actual recommended RVW was rejected, after the compelling evidence was accepted, and the tab was sent to facilitation. At facilitation, it was agreed we would postpone final resolution until the RUC had determined a methodology for dealing with so-called "23hr" stay issues. At the October 2008 RUC meeting, the RUC Research subcommittee approved a revised RUC questionnaire and RUC Summary of Recommendation form that surveyed respondents on these questions. As such, we surveyed the codes and bring them forward to the RUC at this meeting for final consideration.

Wrong Specialty Surveyed – 28120

Current data for 28120 (2008 RVW=5.64) is based on a Harvard survey of orthopaedic surgeons. Podiatrists were not included in the Harvard study. Additionally, Harvard only surveyed intra-service time (of orthopaedic surgeons) and the post-op visits were predicted by a CMS contractor (Dan Dunn) using an algorithm (not survey). The current RVW (5.64) and Harvard time/visit data result in a low IWPUT = 0.007.

Current Medicare utilization data indicate that podiatry is the primary provider for 28120 (51%) compared with orthopaedic surgery (37%). For the current RUC survey, both orthopaedic surgeons and podiatrists were surveyed. The survey statistics for all surveys and by specialty are presented below, showing that there is a significant difference in the post-operative visits between the specialties.

SPEC	Resp	Median RVW	EVAL	POSIT	SDW	Med Intra	P-SD	99232	99231	99238	99213	99212
ALL	52	**8.89**	45	10	15	50	20	1	1	1	2	3
ORT	25	**9.00**	40	10	15	45	20	2	1	1	2	2
POD	27	**8.77**	45	10	15	60	20	1	1	1	3	3

Wrong Specialty Surveyed – 28122

Current data for 28122 (2008 RVW=7.56) is based on a Harvard survey of orthopaedic surgeons. Podiatrists were not included in the Harvard study. Additionally, Harvard only surveyed intra-service time (of orthopaedic surgeons) and the post-op visits were predicted by a CMS contractor (Dan Dunn) using an algorithm (not survey). The current RVW (7.56) and Harvard time/visit data result in a low IWPUT = 0.033.

Current Medicare utilization data indicate that podiatry is the primary provider for 28122 (74%) compared with orthopaedic surgery (21%). For the current RUC survey, both orthopaedic surgeons and podiatrists were surveyed. The survey statistics for all surveys and by specialty are presented below, showing that there is a significant difference in the post-operative visits between the specialties.

SPEC	Resp	Median RVW	EVAL	POSIT	SDW	Med Intra	P-SD	99232	99231	99238	99213	99212
ALL	33	**8.35**	45	10	15	45	20	1	1	1	4	2
ORT	10	**8.00**	40	10	15	45	20	2	1	1	2	2
POD	23	**9.00**	45	10	15	60	20	1	1	1	2	4

Rank Order Anomaly – 28120 and 28122

We also note that the Harvard-based RVWs for 28120 (RVW=5.64) and 28122 (RVW=7.56) present a rank order anomaly. Harvard only surveyed for intra-time for these two codes, which showed that 28120 had greater intra-time than 28122 (67 vs 51 min). The prediction of post-work resulted in 28120 having less post-work compared with 28122. This resulted in 28120 having a lower RVW than 28122. We believe this is incorrect and is clearly an indication that use of the prediction algorithm was flawed for these two codes.

We believe there is a rank order anomaly - code 28120 should have a higher RVW than 28122 for the following reasons:

- Code 28120 requires slightly more intra-operative time than 28122. The talus and calcaneus, being the largest bones of the foot, and the most weightbearing, would cause a greater risk of morbidity and subsequent limb loss in the typical diabetic patient with osteomyelitis.

We believe we have compelling evidence to review the survey data and RVWs for 28120 and 28122 based on the arguments above that indicate the wrong specialty was surveyed and the predicted pre/post-work resulted in incorrect assumptions (ie, incorrect rank order).

RATIONALE FOR REVISING WORK RVUs:

We have reviewed the pre-service time components and are recommending from the pre-service package 3 a decrease in pre-service evaluation time from to 33 minutes for both codes. This is consistent with the other foot/ankle codes that are part of the site-of-service review and is the standard for pre-service package 3. The pre-service positioning time has been changed by increasing the pre-service positioning time for pre-service package 3 by 17 minutes for a total of 20 minutes pre-service positioning time. The patient for 28120 will be prone, and 20 minutes positioning for prone patients is the same positioning time used for prone patients in other recent orthopaedic RUC summary of recommendations. This allows us to maintain consistency across all musculoskeletal codes for pre-service positioning for prone patients

28120 Site of Service: Although the Medicare claims data in the RUC database indicate 40% inpatient hospital and 41% outpatient hospital, our expert consensus panel believes these patients require close monitoring on the day of the procedure and are admitted for continued monitoring at least overnight. These patients typically have many co-morbidities including diabetes. They require close observation of their medical status as well as wound inspection and monitoring of lower extremity neurovascular status. The next day, after examining the patient and reviewing t chart, the surgeon will determine if it is safe to discharge the patient.

28122 Site of Service: The Medicare claims data in the RUC database indicate 25% inpatient hospital and 44% outpatient hospital, and 21% ASC. However, our expert consensus panel believes these patients require close monitoring on the day of the procedure and are admitted for continued monitoring at least overnight. These patients typically have many co-morbidities including diabetes. They require close observation of their medical status as well as wound inspection and monitoring of lower extremity neurovascular status. The next day, after examining the patient and reviewing the chart, the surgeon will determine if it is safe to discharge the patient.

28120 and key ref 28288: In comparison to key reference code 28289 Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint the intra-operative time and post-operative work for 28120 will be greater. Code 28289 is performed only 2% inpatient compared with 28120 which is performed 40% inpatient. The patient undergoing 28120 has more co-morbidities that will require the procedure to typically be performed in a facility, with close monitoring after the procedure. Total time for 28120 is more than 100 minutes greater than the total time for 28289.

28122 and key ref 28289: In comparison to key reference code 28289 *Ostectomy, partial, exostectomy or condylectomy, metatarsal head, each metatarsal head* the intra-operative time and post-operative work for 28120 will be greater. Code 28288 is performed only 6% inpatient compared with 28122 which is performed 25% inpatient. More patients undergoing 28122 have more co-morbidities than code 28288 patients. Total time for 28122 is significantly greater than the total time for 28288.

We recommend an RVW of 8.08 for 28120 and 7.88 for 28122 and the time and visit information shown below This will correct the rank order anomaly between these two codes and correct the undervaluation of postoperative work predicted by Harvard. As the tables show, the IWPUTs for the recommended values are still very low (.022 for 28120 and .030 for 28122). The last table, showing the recommended RVW in comparison to other similarly valued codes, confirms that the total times for 28120 and 28122 are quite high compared to codes with similar

RVWs. This supports that the values we are recommending are, if anything, lower than they should be, but still in better rank order than if the current values were maintained.

Statistics for 28120:

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28120

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Podiatry How often? Sometimes

Specialty Orthopaedic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
3,633 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Medicare claims data

Specialty podiatry Frequency 1868 Percentage 51.41 %

Specialty ortho Frequency 1294 Percentage 35.61 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:28122 Tracking Number Specialty Society Recommended RVU: **7.88**

Global Period: 090 RUC Recommended RVU: **7.56**

CPT Descriptor: Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (eg, osteomyelitis or bossing); tarsal or metatarsal bone, except talus or calcaneus

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62 year-old insulin-dependent diabetic female presents with a chronic, trophic ulcer on the plantar aspect of her right cuboid. A sinus tract leads to the cuboid, and bone scans are positive for osteomyelitis. She requires resection of the inferior aspect of the right cuboid.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Percent of survey respondents who stated they perform the procedure; In the hospital 83% , In the ASC 17%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 12% , Kept overnight (less than 24 hours) 30% , Admitted (more than 24 hours) 58%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 92%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 5%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: • Select and order the appropriate antibiotic(s) and confirm timing and administration.

- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Review results of preadmission testing including labs, X-rays, CT scans, bone scan and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient prone positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work:

Under anesthesia, two semi-elliptical incisions are made on the plantar aspect of the cuboid, encompassing a 1 cm diameter ulcer. Using bone rongeurs and bone curettes, a portion of the cuboid is resected and sent for culture and pathology. The remaining healthy bone is rasped smooth. The wound is inspected and irrigated. The wound is packed open.

Description of Post-Service Work:
Post-service work: in facility

- Application of a dressing and short leg splint
- Monitor patient stabilization in the recovery room.
- Consultation with the family and patient regarding the surgery and postoperative regimen.
- Communication with health care professionals including written and oral reports and orders.
- Postoperative care is coordinated with recovery room nursing staff.
- The patient is discharged to the orthopaedic floor for overnight observation to monitor wound, drains, anticoagulation. The physician visits the patient on the floor that evening.

Discharge day:

- The patient's vital signs are checked.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Orders are written for evaluation of periodic imaging and laboratory reports; review of anticoagulation laboratory values and appropriate medication adjustment, and antibiotic and pain medication adjustments
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Physical therapy for the uses of crutches or walker is ordered
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order physical therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

We believe that codes 28120 *Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bon (eg, osteomyelitis or bossing); talus or calcaneus* and 28122 *Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (eg, osteomyelitis or bossing); tarsal or metatarsal bone, except talus or calcaneus* need to be considered together because they have similar and overlapping arguments for review, including wrong specialty surveyed and rank order anomaly.

Both were brought forward by the RUC through the 5-Year Review ID workgroup as part of the site-of-service anomaly review. Both codes were then surveyed for the February 2008 RUC meeting but were postponed for review until the April 2008 RUC meeting. At the April RUC meeting, the AAOS, AOFAS, and APMA presented the two codes for RUC review with a recommendation for an increase in value. At the April 2008 RUC meeting the RUC heard the compelling evidence argument by the presenters and voted to accept the compelling evidence and to allow the presenters to recommend an increased value. However, the actual recommended RVW was rejected, after the compelling evidence was accepted, and the tab was sent to facilitation. At facilitation, it was agreed we would postpone final resolution until the RUC had determined a methodology for dealing with so-called "23hr" stay issues. At the October 2008 RUC meeting, the RUC Research subcommittee approved a revised RUC questionnaire and RUC Summary of Recommendation form that surveyed respondents on these questions. As such, we surveyed the codes and bring them forward to the RUC at this meeting for final consideration.

Wrong Specialty Surveyed - 28120

Current data for 28120 (2008 RVW=5.64) is based on a Harvard survey of orthopaedic surgeons. Podiatrists were not included in the Harvard study. Additionally, Harvard only surveyed intra-service time (of orthopaedic surgeons) and the post-op visits were predicted by a CMS contractor (Dan Dunn) using an algorithm (not survey). The current RVW (5.64) and Harvard time/visit data result in a low IWPUT = 0.007.

Current Medicare utilization data indicate that podiatry is the primary provider for 28120 (51%) compared with orthopaedic surgery (37%). For the current RUC survey, both orthopaedic surgeons and podiatrists were surveyed. The survey statistics for all surveys and by specialty are presented below, showing that there is a significant difference in the post-operative visits between the specialties.

SPEC	Resp	Median RVW	EVAL	POSIT	SDW	Med Intra	P-SD	99232	99231	99238	99213	99212
ALL	52	**8.89**	45	10	15	50	20	1	1	1	2	3
ORT	25	**9.00**	40	10	15	45	20	2	1	1	2	2
POD	27	**8.77**	45	10	15	60	20	1	1	1	3	3

Wrong Specialty Surveyed - 28122

Current data for 28122 (2008 RVW=7.56) is based on a Harvard survey of orthopaedic surgeons. Podiatrists were not included in the Harvard study. Additionally, Harvard only surveyed intra-service time (of orthopaedic surgeons) and the post-op visits were predicted by a CMS contractor (Dan Dunn) using an algorithm (not survey). The current RVW (7.56) and Harvard time/visit data result in a low IWPUT = 0.033.

Current Medicare utilization data indicate that podiatry is the primary provider for 28122 (74%) compared with orthopaedic surgery (21%). For the current RUC survey, both orthopaedic surgeons and podiatrists were surveyed. The survey statistics for all surveys and by specialty are presented below, showing that there is a significant difference in the post-operative visits between the specialties.

SPEC	Resp	Median RVW	EVAL	POSIT	SDW	Med Intra	P-SD	99232	99231	99238	99213	99212
ALL	33	**8.35**	45	10	15	45	20	1	1	1	4	2
ORT	10	**8.00**	40	10	15	45	20	2	1	1	2	2
POD	23	**9.00**	45	10	15	60	20	1	1	1	2	4

Rank Order Anomaly - 28120 and 28122

We also note that the Harvard-based RVWs for 28120 (RVW=5.64) and 28122 (RVW=7.56) present a rank order anomaly. Harvard only surveyed for intra-time for these two codes, which showed that 28120 had greater intra-time than 28122 (67 vs 51 min). The prediction of post-work resulted in 28120 having less post-work compared with 28122. This resulted in 28120 having a lower RVW than 28122. We believe this is incorrect and is clearly an indication that use of the prediction algorithm was flawed for these two codes.

We believe there is a rank order anomaly - code 28120 should have a higher RVW than 28122 for the following reasons:

- Code 28120 requires slightly more intra-operative time than 28122. The talus and calcaneus, being the largest bones of the foot, and the most weightbearing, would cause a greater risk of morbidity and subsequent limb loss in the typical diabetic patient with osteomyelitis.

We believe we have compelling evidence to review the survey data and RVWs for 28120 and 28122 based on the arguments above that indicate the wrong specialty was surveyed and the predicted pre/post-work resulted in incorrect assumptions (ie, incorrect rank order).

RATIONALE FOR REVISING WORK RVUs:

We have reviewed the pre-service time components and are recommending from the pre-service package 3 a decrease in pre-service evaluation time from to 33 minutes for both codes. This is consistent with the other foot/ankle codes that are part of the site-of-service review and is the standard for pre-service package 3. The pre-service positioning time has been changed by increasing the pre-service positioning time for pre-service package 3 by 17 minutes for a total of 20 minutes pre-service positioning time. The patient for 28120 will be prone, and 20 minutes positioning for prone patients is the same positioning time used for prone patients in other recent orthopaedic RUC summary of recommendations. This allows us to maintain consistency across all musculoskeletal codes for pre-service positioning for prone patients

28120 Site of Service: Although the Medicare claims data in the RUC database indicate 40% inpatient hospital and 41% outpatient hospital, our expert consensus panel believes these patients require close monitoring on the day of the procedure and are admitted for continued monitoring at least overnight. These patients typically have many co-morbidities including diabetes. They require close observation of their medical status as well as wound inspection and monitoring of lower extremity neurovascular status. The next day, after examining the patient and reviewing t' chart, the surgeon will determine if it is safe to discharge the patient.

28122 Site of Service: The Medicare claims data in the RUC database indicate 25% inpatient hospital and 44% outpatient hospital, and 21% ASC. However, our expert consensus panel believes these patients require close monitoring on the day of the procedure and are admitted for continued monitoring at least overnight. These patients typically have many co-morbidities including diabetes. They require close observation of their medical status as well as wound inspection and monitoring of lower extremity neurovascular status. The next day, after examining the patient and reviewing the chart, the surgeon will determine if it is safe to discharge the patient.

28120 and key ref 28288: In comparison to key reference code 28289 Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint the intra-operative time and post-operative work for 28120 will be greater. Code 28289 is performed only 2% inpatient compared with 28120 which is performed 40% inpatient. The patient undergoing 28120 has more co-morbidities that will require the procedure to typically be performed in a facility, with close monitoring after the procedure. Total time for 28120 is more than 100 minutes greater than the total time for 28289.

28122 and key ref 28289: In comparison to key reference code 28289 *Ostectomy, partial, exostectomy or condylectomy, metatarsal head, each metatarsal head* the intra-operative time and post-operative work for 28120 will be greater. Code 28288 is performed only 6% inpatient compared with 28122 which is performed 25% inpatient. More patients undergoing 28122 have more co-morbidities than code 28288 patients. Total time for 28122 is significantly greater than the total time for 28288.

We recommend an RVW of 8.08 for 28120 and 7.88 for 28122 and the time and visit information shown below This will correct the rank order anomaly between these two codes and correct the undervaluation of postoperative work predicted by Harvard. As the tables show, the IWPUTs for the recommended values are still very low (.022 for 28120 and .030 for 28122). The last table, showing the recommended RVW in comparison to other similarly valued codes, confirms that the total times for 28120 and 28122 are quite high compared to codes with similar

RVWs. This supports that the values we are recommending are, if anything, lower than they should be, but still in better rank order than if the current values were maintained.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28122

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Podiatry How often? Commonly

Specialty Orthopaedic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national frequency not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 10,213 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare claims data

Specialty podiatry Frequency 7459 Percentage 73.03 %

Specialty ortho Frequency 2263 Percentage 22.15 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. The current PLI RVU for 28122 should be maintained as there has been no recommended chang in work RVU.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from the Five Year Review

February 2009

Foot Arthrodesis

CPT codes 28725, *Arthrodesis; subtalar* and 28730, *Arthrodesis, midtarsal or tarsometatarsal, multiple or transverse;* were identified by the Five-Year Review Identification Workgroup as potentially misvalued through its Site of Service Anomaly screen in September 2007. The Workgroup reviewed all services that include inpatient hospital visits within their global periods, but are performed less than 50% of the time in the inpatient setting, according to recent Medicare utilization data. The RUC originally recommended a two-step action. First, the RUC removed the hospital visits from the service with no impact on the associated work RVU. Second, the RUC recommended that services be surveyed. At the April 2008 RUC Meeting, the specialty societies presented data that indicate that although these procedures are reported as outpatient procedures more than 50% of the time, patients typically spend at least one night in the hospital. The RUC deferred action on these issues until an adequate survey instrument was developed. The RUC approved a revised survey instrument in October 2008 and these procedures were surveyed for review at the February 2009 RUC Meeting.

1728

28725
The RUC reviewed the specialties' evidence in order to recommend increases in the current work RVU for 28725. The specialties noted that the procedure has never been reviewed by the RUC and that podiatrists, who perform 31% of the procedures were not included in the original Harvard survey. The RUC did not agree that compelling evidence existed to justify an increase in work RVU, but did agree that there was evidence to support a recommendation by the specialties to maintain the current work RVU. The specialty societies presented the results of a survey of 71 orthopaedic surgeons and podiatrists. The survey data showed that 74% of patients stay overnight following the surgery. The specialty also indicated that the typical patient is seen on the same day following the procedure as well as the next day. Because these patients typically have several morbidities, including diabetes, they require close observation of their medical status as well as wound inspection and monitoring of lower extremity neurovascular status. Therefore, the RUC agreed that one 99231 hospital visit as well as a full 99238 discharge day management service are appropriate. The RUC reviewed the survey data and agreed with the survey median physician times of 70 pre-service, 90 intra-service, and 20 immediate post-service. The RUC was convinced, following a review of the survey data, that that the survey physician time and visit data

accurately the work included in the procedure. Based on its review of the survey data, the RUC agreed that the current work RVU of 11.97 was the appropriate valuation of the work involved in the service. The RUC noted that the current work RVU is below the survey 25th percentile work RVU. The RUC also reviewed several reference codes to support a work RVU of 11.97 for 28725. Codes 28261, *Capsulotomy, midfoot; with tendon lengthening*, (work RVU = 12.91, pre-service = 60, intra-service = 103, post-service = 30) and 25608, *Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 2 fragments*, (10.86, pre-service = 65, intra-service = 90, post-service = 30). **The RUC recommends maintaining the current work RVU of 11.97 and accepting the median survey physician time and post-operative visits for CPT code 28725.**

28730

The RUC reviewed the specialties' evidence in order to recommend increases in the current work RVU for 28730. The specialties noted that the procedure has never been reviewed by the RUC and that podiatrists, who perform 33% of the procedures were not included in the original Harvard survey. The RUC did not agree that compelling evidence existed to justify an increase in work RVU, but did agree that there was evidence to support a recommendation by the specialties to maintain the current work RVU. The specialty societies presented the results of a survey of 71 orthopaedic surgeons and podiatrists. The survey data showed that 74% of patients stay overnight following the surgery. The specialty also indicated that the typical patient is seen on the same day following the procedure as well as the next day. Because these patients typically have several morbidities, including diabetes, they require close observation of their medical status as well as wound inspection and monitoring of lower extremity neurovascular status. Therefore, the RUC agreed that one 99231 hospital visit as well as a full 99238 discharge day management service are appropriate. The RUC survey data and agreed with the survey median physician times of 70 pre-service, 100 intra-service, and 20 immediate post-service. The RUC was convinced, following a review of the survey data, that the survey physician time and visit data accurately the work included in the procedure. Based on its review of the survey data, the RUC agreed that the current work RVU of 12.21 was the appropriate valuation of the work involved in the service. The RUC also noted that the current work RVU is below the survey 25th percentile work RVU. The RUC also reviewed several reference codes to support a work RVU of 12.21 for 28730. 28309, *Osteotomy, with or without lengthening, shortening or angular correction, metatarsal; multiple (eg, Swanson type cavus foot procedure)* (work RVU = 13.96, pre-service = 60, intra-service = 110, post-service = 30) and 29862, *Arthroscopy, hip, surgical; with debridement/shaving of articular cartilage (chondroplasty), abrasion arthroplasty, and/or resection of labrum* (work RVU = 10.97, pre-service = 75, intra-service = 100, post-service = 30). The RUC noted that while the procedures are similar in intensity and complexity, 28730 required less intra-service time than 28309, which accounts for the smaller work RVU. The RUC also commented that 28730 is similar to 29862, which both require 100 minutes of intra-service time, but requires slightly more complexity, which supports the higher work RVU of 28730. **The RUC recommends maintaining the current work RVU of 12.21 and accepting the median survey physician time and post-operative visits for CPT code 28730.**

1729

Practice Expense
The RUC recommends that the non-facility practice expense inputs be modified to reflect changes to the post-operative office visits and that the physician-assist time be modified to reflect changes to the intra-service time.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
28725	Arthrodesis; subtalar	090	11.97 (No Change)
28730	Arthrodesis, midtarsal or tarsometatarsal, multiple or transverse;	090	12.21 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:28725 Tracking Number Specialty Society Recommended RVU: **13.50**

Global Period: 090 RUC Recommended RVU: **11.97**

CPT Descriptor: Arthrodesis; subtalar

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 36-year-old male presents with a chronic, painful foot secondary to an old calcaneal fracture. Clinical findings, X-rays and a CT scan reveal an arthritic subtalar joint. He undergoes a subtalar arthrodesis.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Percent of survey respondents who stated they perform the procedure; In the hospital 89% , In the ASC 11%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 17% , Kept overnight (less than 24 hours) 56% , Admitted (more than 24 hours) 27%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 89%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 18%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

- Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
- The leg is prepped and draped.
- The leg is elevated and exsanguinated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, an incision is made over the lateral hindfoot. Neurovascular structures are identified and protected. The incision is carried down through the sinus tarsi to the subtalar joint. The articular cartilage in the subtalar joint is removed down to bleeding bone. Loose fragments are irrigated and removed. The foot is placed in a functional position and the fusion is fixed with internal fixation. Position is verified using fluoroscopy. The wound is inspected and irrigated. Bone graft is inserted as necessary. A hemovac drain is placed. The wound is closed in layers.

Description of Post-Service Work:

Post-service work: in facility

- Application of a dressing and short leg splint.
- Monitor patient during reversal of anesthesia.
- Assist in transfer of patient from operating table to gurney.
- Monitor transport of patient from operating room to recovery room
- Discuss postoperative recovery care with anesthesia and nursing staff.
- Discuss procedure and outcome with family in waiting area.
- Write brief operative note or complete final operative note and place in chart.
- Dictate operative report and copy referring physician(s).
- Correctly assign CPT codes including Physicians Quality and Reporting Initiative (PQRI) add-on codes where appropriate.
- Write orders for transferring to surgical floor and discuss ongoing care with floor nurses.
- Monitor and document patient progress.
- Assess pain scores and adequacy of analgesia.
- Review nursing/other staff patient chart notes.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Orders are written for evaluation of periodic imaging and laboratory reports; review of anticoagulation laboratory values and appropriate medication adjustment, and antibiotic and pain medication adjustments
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

Time Segments (Mean)

Pre-Service intensity/complexity	3.64	3.61
Intra-Service intensity/complexity	4.11	4.07
Post-Service intensity/complexity	3.31	3.32

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

We believe that codes 28725 Arthrodesis; subtalar and 28730 Arthrodesis, midtarsal or tarsometatarsal, multiple or transverse, need to be considered together because they have similar and overlapping arguments for review, including wrong specialty surveyed. Both were brought forward by the RUC through the 5-Year Review ID workgroup as part of the site-of-service anomaly review. Both codes were then surveyed for the February 2008 RUC meeting but were postponed for review until the April 2008 RUC meeting. At the April RUC meeting, the AAOS, AOFAS, and APMA in a joint letter requested the two codes be postponed further until the RUC had arrived at a methodology for

dealing with procedures where the dominant specialties believed physicians were performing hospital visits and patients were not being discharged within 23 hours even if the hospitals were reporting a same-day discharge. At the October 2008 RUC meeting, the RUC Research subcommittee approved a revised RUC questionnaire and RUC Summary of Recommendation form that surveyed respondents on these questions. As such, we surveyed the codes and bring them forward to the RUC at this meeting for final consideration.

Wrong Specialty Surveyed - 28725

Current data for 28725 (2008 RVW=11.97) is based on a Harvard survey of orthopaedic surgeons. Podiatrists were not included in the Harvard study. Additionally, Harvard only surveyed intra-service time (of orthopaedic surgeons) and the post-op visits were predicted by a CMS contractor (Dan Dunn) using an algorithm (not survey).

Current Medicare utilization data indicate that podiatry is a very significant provider for 28725 (31%). For the current RUC survey, both orthopaedic surgeons and podiatrists were surveyed and we believe this is a more thorough and accurate assessment of providers. The survey statistics for all surveys and by specialty are presented below, showing that there is a significant difference in the post-operative visits between the specialties.

SPEC	Resp	Median RVW	EVAL	POSIT	SDW	Med Intra	P-SD	99231	99238	99213	99212
ALL	71	**15.00**	45	10	15	90	20	1	1	3	2
ORT	49	**15.00**	40	10	15	100	20	1	1	3	1
POD	22	**14.35**	60	15	17.5	97	30	1	1	4	2

Wrong Specialty Surveyed - 28730

Current data for 28730 (2008 RVW=12.21) is based on a Harvard survey of orthopaedic surgeons. Podiatrists were not included in the Harvard study. Additionally, Harvard only surveyed intra-service time (of orthopaedic surgeons) and the post-op visits were predicted by a CMS contractor (Dan Dunn) using an algorithm (not survey).

Current Medicare utilization data indicate that podiatry is a very significant provider for 28730 (33%). For the current RUC survey, both orthopaedic surgeons and podiatrists were surveyed and we believe this is a more thorough and accurate assessment of providers. The survey statistics for all surveys and by specialty are presented below, showing that there is a significant difference in the post-operative visits between the specialties.

SPEC	Resp	Median RVW	EVAL	POSIT	SDW	Med Intra	P-SD	99231	99238	99213	99212
ALL	71	**15.00**	45	10	15	100	20	1	1	3	2
ORT	49	**15.70**	45	10	15	120	20	1	1	3	1
POD	22	**14.00**	60	15	20	120	30	1	1	4	2

We believe we have compelling evidence to review the survey data and RVWs for 28725 and 28730 based on the arguments above that indicate the wrong specialty was surveyed and the predicted pre/post-work resulted in incorrect assumptions

---

RATIONALE FOR REVISING WORK RVUs:

We have reviewed the pre-service time components and are recommending the pre-service package of 3. We are using 33 for pre-service evaluation time This is consistent with the other foot/ankle codes that are part of the site-of-service review and is the standard for pre-service package 3. The pre-service positioning time has been kept at 3 minutes, which is the pre-service positioning time assigned by pre-service standard package 3. Pre-service Scrub, Dress and Wait time is also maintained at 15 minutes.

28725 Site of Service: Although the Medicare claims data in the RUC database indicate 41% inpatient hospital and 49% outpatient hospital, our expert consensus panel believes these patients require close monitoring on the day of

the procedure and are admitted for continued monitoring at least overnight. These patients typically have many co-morbidities including diabetes. They require close observation of their medical status as well as wound inspection and monitoring of lower extremity neurovascular status. The next day, after examining the patient and reviewing the chart, the surgeon will determine if it is safe to discharge the patient. Our expert panel does not believe a separat hospital visit is typically performed on the day of the procedure.

28730 Site of Service: The Medicare claims data in the RUC database indicate 38% inpatient hospital and 49% outpatient hospital, and 12% ASC. However, our expert consensus panel believes these patients require close monitoring on the day of the procedure and are admitted for continued monitoring at least overnight. These patients typically have many co-morbidities including diabetes. They require close observation of their medical status as well as wound inspection and monitoring of lower extremity neurovascular status. The next day, after examining the patient and reviewing the chart, the surgeon will determine if it is safe to discharge the patient. Our expert panel does not believe a separate hospital visit is typically performed on the day of the procedure.

28725 and key ref 27870: In comparison to key reference code 28289 Arthrodesis, ankle, open, the intra-operative time for 28725 will be less than 27870 (90 minutes versus 140 minutes) as will post-operative work for 28725 (28725 has a total post-operative visit time of 121 minutes versus a total post-operative visit time of 132 minutes for 27870) Total time for 27870 is 80 minutes more than the total time for 28725 (400 minutes for 27870 and 320 minutes for 28725). The IWPUT for 28725 is appropriately greater than the IWPUT for 27870 (.071 versus .048)

28730 and key ref 27870: In comparison to key reference code 28289 Arthrodesis, ankle, open, the intra-operative time for 28730 will be less than 27870 (100 minutes versus 140 minutes) as will post-operative work for 28730 (28730 has a total post-operative visit time of 121 minutes versus a total post-operative visit time of 132 minutes for 27870). Total time for 27870 is 70 minutes more than the total time for 28730 (400 minutes for 27870 and 330 minutes for 28730). The IWPUT for 28730 is appropriately greater than the IWPUT for 27870 (.069 versus .048)

We recommend an RVW of 13.50 for 28725 and 14.00 for 28730 and the time and visit information shown below. This will correctly value these two procedures relative to key reference code 27870 and other codes in the physician fee schedule

Statistics for 28725:

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28725

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Commonly

Specialty podiatry How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national, non-medicare, frequency figures not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
2,557 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. 2006 Medicare frequency

Specialty orthopaedic surgery Frequency 1746 Percentage 68.28 %

Specialty podiatry Frequency 804 Percentage 31.44 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. There is no change in the work RVU, therefore the PLI RVU should remain the same.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:28730 Tracking Number Specialty Society Recommended RVU: **14.00**

Global Period: 090 RUC Recommended RVU: **12.21**

CPT Descriptor: Arthrodesis, midtarsal or tarsometatarsal, multiple or transverse;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female presents with foot pain secondary to rheumatoid arthritis. X-rays and CT scan reveal severely arthritic tarsometatarsal joints. She requires arthrodesis of the tarsometatarsal joints.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Percent of survey respondents who stated they perform the procedure; In the hospital 92% , In the ASC 8%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 15% , Kept overnight (less than 24 hours) 55% , Admitted (more than 24 hours) 29%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 80%

's moderate sedation inherent to this procedure in the Hospital/ASC setting? No
ercent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 21%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: • Select and order the appropriate antibiotic(s) and confirm timing and administration.

- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs.
- Perform H&P
- Meet with patient and family to review planned procedure and post-operative management
- Review informed consent with patient
- Verify that all required instruments and supplies are available
- Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes
- Assess position of the extremities and head, adjust as needed
- The patient's leg is placed properly on the table and positioned with proper bolstering to aid surgical exposure.
- Indicate areas of skin to be prepped and mark surgical incisions
- A tourniquet is placed on the proximal thigh
  The leg is prepped and draped.
  The leg is elevated and exsanguinated.
- Scrub and gown
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: Under anesthesia, two incisions are made over the medial first and dorsal third tarsometatarsal joints. Neurovascular structures are identified and protected. The incision is carried down to bone and the tarsometatarsal joints are exposed. The articular cartilage is removed down to bleeding bone. Loose fragments are irrigated and removed. The foot is placed in a functional position and the fusion is fixed with internal fixation. Posit is verified using fluoroscopy. The wound is inspected and irrigated. Bone graft is inserted as necessary. A hemc drain is placed. The wound is closed in layers.

Description of Post-Service Work:
Post-service work: in facility

- Application of a dressing and short leg splint.
- Monitor patient during reversal of anesthesia.
- Assist in transfer of patient from operating table to gurney.
- Monitor transport of patient from operating room to recovery room
- Discuss postoperative recovery care with anesthesia and nursing staff.
- Discuss procedure and outcome with family in waiting area.
- Write brief operative note or complete final operative note and place in chart.
- Dictate operative report and copy referring physician(s).
- Correctly assign CPT codes including Physicians Quality and Reporting Initiative (PQRI) add-on codes where appropriate.
- Write orders for transferring to surgical floor and discuss ongoing care with floor nurses.
- Monitor and document patient progress.
- Assess pain scores and adequacy of analgesia.
- Review nursing/other staff patient chart notes.
- The circulation, sensation and motor function of the operated extremity are assessed.
- Orders are written for evaluation of periodic imaging and laboratory reports; review of anticoagulation laboratory values and appropriate medication adjustment, and antibiotic and pain medication adjustments
- Home restrictions (ie, activity, bathing) are discussed with the patient and family members
- Write prescriptions for medications needed post-discharge.
- Dictation of an operative report
- Procedure note is written in the patient chart
- All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-service work: in office

- Examine and talk with patient
- Answer patient/family questions
- Removal of splint/dressings
- Assessment of surgical wound
- Remove sutures
- Assess of circulation, sensation and motor function of the operated extremity
- Redress wound
- Order occupational therapy
- Supervision of rehabilitation
- Discuss progress with PCP (verbal and written)
- Write medication prescriptions
- Dictate progress notes for medical record

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2009
Presenter(s):	William Creevy, MD; Tye Ouzounian, MD; Frank Spinosa, DPM; Robb Mothershed, DPM; Timothy Tillo, DPM

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 23 **% of respondents:** 32.3 %

TIME ESTIMATES (Median)	CPT Code: 28730	Key Reference CPT Code: 27870	Source of Time
Median Pre-Service Time	70.00	60.00	
Median Intra-Service Time	100.00	140.00	
Median Immediate Post-service Time	20.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	20.0	40.00	
Median Discharge Day Management Time	38.0	38.00	
Median Office Visit Time	101.0	92.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**349.00**	**400.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.68	3.64
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.82	3.86
Urgency of medical decision making	2.59	3.64

Technical Skill/Physical Effort (Mean)

Technical skill required	4.68	4.32
Physical effort required	3.86	3.82

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.14	4.00
Outcome depends on the skill and judgment of physician	4.50	4.23
Estimated risk of malpractice suit with poor outcome	3.73	3.59

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.70	3.68
Intra-Service intensity/complexity	4.57	4.41
Post-Service intensity/complexity	3.52	3.55

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

We believe that codes 28725 Arthrodesis; subtalar and 28730 Arthrodesis, midtarsal or tarsometatarsal, multiple or transverse, need to be considered together because they have similar and overlapping arguments for review, including wrong specialty surveyed. Both were brought forward by the RUC through the 5-Year Review ID workgroup as part of the site-of-service anomaly review. Both codes were then surveyed for the February 2008 RUC meeting but were postponed for review until the April 2008 RUC meeting. At the April RUC meeting, the AAOS, AOFAS, and

APMA in a joint letter requested the two codes be postponed further until the RUC had arrived at a methodology for dealing with procedures where the dominant specialties believed physicians were performing hospital visits and patients were not being discharged within 23 hours even if the hospitals were reporting a same-day discharge. At the October 2008 RUC meeting, the RUC Research subcommittee approved a revised RUC questionnaire and RUC Summary of Recommendation form that surveyed respondents on these questions. As such, we surveyed the code and bring them forward to the RUC at this meeting for final consideration.

Wrong Specialty Surveyed - 28725

Current data for 28725 (2008 RVW=11.97) is based on a Harvard survey of orthopaedic surgeons. Podiatrists were not included in the Harvard study. Additionally, Harvard only surveyed intra-service time (of orthopaedic surgeons) and the post-op visits were predicted by a CMS contractor (Dan Dunn) using an algorithm (not survey).

Current Medicare utilization data indicate that podiatry is a very significant provider for 28725 (31%). For the current RUC survey, both orthopaedic surgeons and podiatrists were surveyed and we believe this is a more thorough and accurate assessment of providers. The survey statistics for all surveys and by specialty are presented below, showing that there is a significant difference in the post-operative visits between the specialties.

SPEC	Resp	Median RVW	EVAL	POSIT	SDW	Med Intra	P-SD	99231	99238	99213	99212
ALL	71	**15.00**	45	10	15	90	20	1	1	3	2
ORT	49	**15.00**	40	10	15	100	20	1	1	3	1
POD	22	**14.35**	60	15	17.5	97	30	1	1	4	2

Wrong Specialty Surveyed - 28730

Current data for 28730 (2008 RVW=12.21) is based on a Harvard survey of orthopaedic surgeons. Podiatrists were not included in the Harvard study. Additionally, Harvard only surveyed intra-service time (of orthopaedic surgeons) and the post-op visits were predicted by a CMS contractor (Dan Dunn) using an algorithm (not survey).

Current Medicare utilization data indicate that podiatry is a very significant provider for 28730 (33%). For the current RUC survey, both orthopaedic surgeons and podiatrists were surveyed and we believe this is a more thorough and accurate assessment of providers. The survey statistics for all surveys and by specialty are presented below, showing that there is a significant difference in the post-operative visits between the specialties.

SPEC	Resp	Median RVW	EVAL	POSIT	SDW	Med Intra	P-SD	99231	99238	99213	99212
ALL	71	**15.00**	45	10	15	100	20	1	1	3	2
ORT	49	**15.70**	45	10	15	120	20	1	1	3	1
POD	22	**14.00**	60	15	20	120	30	1	1	4	2

We believe we have compelling evidence to review the survey data and RVWs for 28725 and 28730 based on the arguments above that indicate the wrong specialty was surveyed and the predicted pre/post-work resulted in incorrect assumptions

RATIONALE FOR REVISING WORK RVUs:

We have reviewed the pre-service time components and are recommending the pre-service package of 3. We are using 33 for pre-service evaluation time This is consistent with the other foot/ankle codes that are part of the site-of-service review and is the standard for pre-service package 3. The pre-service positioning time has been kept at 3 minutes, which is the pre-service positioning time assigned by pre-service standard package 3. Pre-service Scrub, Dress and Wait time is also maintained at 15 minutes.

28725 Site of Service: Although the Medicare claims data in the RUC database indicate 41% inpatient hospital and 49% outpatient hospital, our expert consensus panel believes these patients require close monitoring on the day of the procedure and are admitted for continued monitoring at least overnight. These patients typically have many co-morbidities including diabetes. They require close observation of their medical status as well as wound inspection

and monitoring of lower extremity neurovascular status. The next day, after examining the patient and reviewing the chart, the surgeon will determine if it is safe to discharge the patient. Our expert panel does not believe a separate hospital visit is typically performed on the day of the procedure.

28730 Site of Service: The Medicare claims data in the RUC database indicate 38% inpatient hospital and 49% outpatient hospital, and 12% ASC. However, our expert consensus panel believes these patients require close monitoring on the day of the procedure and are admitted for continued monitoring at least overnight. These patients typically have many co-morbidities including diabetes. They require close observation of their medical status as well as wound inspection and monitoring of lower extremity neurovascular status. The next day, after examining the patient and reviewing the chart, the surgeon will determine if it is safe to discharge the patient. Our expert panel does not believe a separate hospital visit is typically performed on the day of the procedure.

28725 and key ref 27870: In comparison to key reference code 28289 Arthrodesis, ankle, open, the intra-operative time for 28725 will be less than 27870 (90 minutes versus 140 minutes) as will post-operative work for 28725 (28725 has a total post-operative visit time of 121 minutes versus a total post-operative visit time of 132 minutes for 27870) Total time for 27870 is 80 minutes more than the total time for 28725 (400 minutes for 27870 and 320 minutes for 28725). The IWPUT for 28725 is appropriately greater than the IWPUT for 27870 (.071 versus .048)

28730 and key ref 27870: In comparison to key reference code 28289 Arthrodesis, ankle, open, the intra-operative time for 28730 will be less than 27870 (100 minutes versus 140 minutes) as will post-operative work for 28730 (28730 has a total post-operative visit time of 121 minutes versus a total post-operative visit time of 132 minutes for 27870). Total time for 27870 is 70 minutes more than the total time for 28730 (400 minutes for 27870 and 330 minutes for 28730). The IWPUT for 28730 is appropriately greater than the IWPUT for 27870 (.069 versus .048)

We recommend an RVW of 13.50 for 28725 and 14.00 for 28730 and the time and visit information shown below. This will correctly value these two procedures relative to key reference code 27870 and other codes in the physician fee schedule

Statistics for 28725:

Source	IWPUT	RVW	EVAL	POSIT	SDW	Med Intra	P-SD	99232	99231	99238	99213	99212

28262	Capsulotomy, midfoot; extensive, including posterior talotibial capsulotomy and tendon(s) lengthening (eg, resistant clubfoot deformity)	17.01	380	**140**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlis code is reviewed) 28730

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty podiatry How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national, non-medicare, frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
1,499 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. 2006 Medicare Utilization

Specialty orthopaedic surgery Frequency 996 Percentage 66.44 %

Specialty podiatry Frequency 499 Percentage 33.28 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. There is no change in the work RVU, therefore the PLI RVU should remain the same.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Interventional Radiology Procedures

In June 2008, CMS requested the RUC to review direct practice expense recommendations in the non-facility setting for the following CPT Codes:

36481 *Percutaneous portal vein catheterization by any method*
37183 *Revision of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract recanulization/dilatation, stent placement and all associated*
47382 *Ablation, one or more liver tumor(s), percutaneous, radiofrequency*
50200 *Renal biopsy; percutaneous, by trocar or needle*

1754

At the October 2008 RUC meeting all of the CMS requested interventional radiology procedures were reviewed for practice expense and recommendations were made to place all of the procedures on CPT's appendix G to indicate that Moderate Sedation is inherent to these procedures. At that time, the RUC tabled code 36481 after determining that the medical supplies and equipment time included in the recommendation overlapped other services, such as imaging services, that are typically billed at the same time. The RUC also determined the specialty society recommendation lacked RUC standards for practice expense and that other similar services recently reviewed by the RUC may require revised recommendations. Codes 75885 *Percutaneous transhepatic portography with hemodynamic evaluation, radiological supervision and interpretation* and 75887 *Percutaneous transhepatic portography without hemodynamic evaluation, radiological supervision and interpretation* were identified as services to be reviewed concurrently with 36481 at the February 2009 RUC meeting.

At the February 2009 RUC meeting the RUC reviewed the practice expense input recommendations for codes 36481, 75885, and 75887 in tandem as to prevent any overlap or double counting of clinical staff, medical supplies, and/or equipment. The RUC made a minor change to a medical supply and agreed with the remainder of the specialty society's recommendations. **The RUC recommends the attached non-facility direct practice expense inputs for CPT codes 36481, 75885, and 75887.**

CPT Code (•New)	CPT Descriptor	Global Period	Recommendation

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

October 2008 - CMS Request: Practice Expense Review

Interventional Radiology Procedures

In June 2008, CMS requested the RUC to make a direct practice expense recommendation for the non-facility setting for the following CPT Codes:

36481 *Percutaneous portal vein catheterization by any method*
37183 *Revision of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract recanulization/dilatation, stent placement and all associated*
47382 *Ablation, one or more liver tumor(s), percutaneous, radiofrequency*
50200 *Renal biopsy; percutaneous, by trocar or needle*

1758

The RUC initiated a level of interest process in June 2008 and in September 2008 received practice expense recommendation from a specialty society for review at the October 2008 RUC meeting.

36481
The RUC reviewed the direct practice expense inputs recommendation for code 36481 from the specialty society and determined that the medical supplies and equipment time included in the recommendation overlapped other services, such as imaging services, that are typically billed at the same time. The RUC also determined the specialty society recommendation lacked RUC standards for practice expense and that other similar services recently reviewed by the RUC may require revised recommendations. Based on these issues the RUC could not make an informed recommendation at this time. **The RUC recommends that the specialty society develop a revised direct practice expense input recommendation for code 36481 and all codes typically billed with code 36481 (to be determined) for presentation at the next RUC meeting. The RUC also recommends this service be placed on CPT's appendix G to indicate that Moderate Sedation is inherent to the procedure.**

37183
The RUC reviewed the specialty society direct practice expense inputs recommendation for code 37183 and made several edits in clinical staff types and time to be more reflective of the service. The RUC also agreed that this service is typically performed with moderate sedation. **The RUC recommends the attached direct practice expense inputs for code 37183 and recommends that this service be placed on CPT's appendix G to indicate that Moderate Sedation is inherent to the procedure.**

47382
The RUC reviewed the specialty society direct practice expense inputs recommendation for code 37183 and made several edits in clinical staff types for the typical patient scenario. The RUC also agreed that this service is typically performed with moderate sedation. **The RUC recommends the attached direct practice expense inputs for code 47382 and recommends that this service be placed on the CPT's appendix G to indicate that Moderate Sedation is inherent to the procedure.**

50200
The RUC reviewed the specialty society direct practice expense inputs recommendation for code 50200 and made edits in clinical staff types and time to reflect the typical patient encounter. The RUC also agreed that this service is typically performed with moderate sedation. **The RUC recommends the attached direct practice expense inputs for code 50200 and recommends that this service be placed on the CPT's appendix G to indicate that Moderate Sedation is inherent to the procedure.**

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from the Five Year Review

February 2009

Arteriovenous Procedures

CPT code 36825, *Creation of arteriovenous fistula by other than direct arteriovenous anastomosis (separate procedure); autogenous graft*, was identified by the Five-Year Review Identification Workgroup as potentially misvalued through its Site of Service Anomaly screen in September 2007. The Workgroup reviewed all services that include inpatient hospital visits within their global periods, but are performed less than 50% of the time in the inpatient setting, according to recent Medicare utilization data. The RUC originally recommended a two-step action. First, The RUC removed the hospital visits from the service with no impact on the associated work RVU, which CMS agreed with. Second, the RUC recommended that services be surveyed. At the April 2008 RUC Meeting, the specialty societies presented data that indicate that although these procedures are reported as outpatient procedures more than 50% of the time, patients typically spend at least one night in the hospital. The RUC deferred action on these issues until an adequate survey instrument was developed. The RUC approved a revised survey instrument in October 2008 and these procedures were surveyed for review at the February 2009 RUC Meeting.

1770

The RUC first reviewed 36825 to determine if there was compelling evidence to justify a review of the work RVU for a potential increase in value. The specialty society indicated that the service had never been reviewed by the RUC and was originally valued during the Harvard studies. Additionally, the specialty commented that the work involved in the procedure has changed due to a change in the typical patient since its inception. The procedure, which is used to create access for hemodialysis patients, is used less frequently now and on much more complicated patients, than it was in the past. Because of the "fistula first" initiative, patients are typically not undergoing this procedure unless they have failed a direct anastomosis. Since this is a secondary procedure, the patients that undergo a 36825 are typically older, sicker, and have no available hemodialysis access in their arms. Therefore, the physician work has changed. **The RUC agreed that compelling evidence to consider the revaluation of 36825.**

The specialty society presented the data from a survey of 31 general and vascular surgeons. The RUC first reviewed the physician time and post-operative evaluation and management visits. According to the survey, 74% of patients are kept overnight and more than 80% of those patients are seen on the evening of the day of the procedure and again the following day before being discharged. Because of this survey data, the RUC agreed that 36825 includes a full 99238 discharge day management visit as well as one 99231 hospital visit. The RUC also agreed with the survey post-service office visits, which include one 99212 and two 99213 visits. The

RUC also agreed with the survey median intra-service time of 120 minutes, the survey median immediate post-service time of 30 minutes, and pre-service time package #4, difficult patient/difficult procedure, with an additional seven minutes of positioning time. Lastly, the RUC reviewed the recommended work RVU and disagreed with the specialty society expert panel recommendation. The RUC considered the survey data in comparison to the MPC reference code selected by the specialty, 36819, *Arteriovenous anastomosis, open; by upper arm basilic vein transposition*, (work RVU = 14.39). The RUC agreed that the survey median work RVU of 18.00 was too high, but that the survey 25th percentile work RVU was appropriate. The RUC reviewed 36819 and noted that the reference service and the surveyed code contain identical intra-service times of 120 minutes. The specialty noted that there are two differences between 36825 and 36819 that warrant a higher RVU for 36825: (1) 36825 requires a vein that is harvested from a remote location. As a result, it requires two anastomoses, one where the vein is sewn to the inflow artery and a second where it is attached to the outflow vein. (2) The surveyed code includes an additional 99213 office visit. As a result, the RUC agreed that the survey 25th percentile work RVU of 15.00 is appropriate in comparison to 36819 for 36825. **The RUC recommends the specialty's survey 25th percentile work RVU of 15.00 for CPT code 36825.**

Practice Expense

The RUC recommends that the non-facility practice expense inputs be modified to reflect changes to the post-operative office visits and that the physician-assist time be modified to reflect changes to the intra-service time.

1771

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
36820	Arteriovenous anastomosis, open; by forearm vein transposition	090	14.39 (No Change)
36821	direct, any site (eg, Cimino type) (separate procedure)	090	12.00 (No Change)
36825	Creation of arteriovenous fistula by other than direct arteriovenous anastomosis (separate procedure); autogenous graft	090	15.00

Global Period: 090 RUC Recommended RVU: **15.00**

CPT Descriptor: Creation of Arteriovenous fistula by other than direct arteriovenous anastomosis; autogenous graft

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old man undergoes chronic hemodialysis for longstanding renal failure due to renovascular occlusive disease. He has undergone 4 prior native arteriovenous fistulas over the last 8 years, all of which eventually failed. Placement of a new arteriovenous hemoaccess is undertaken in his forearm using greater saphenous vein. Note: the work of this procedure includes vein harvest. Vein harvest is not separately reportable.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 26% , Kept overnight (less than 24 hours) 35% , Admitted (more than 24 hours) 39%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 82%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 26%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Pre-service work begins after the decision to operate, from the day before the operation until the skin incision. This activity includes obtaining and reviewing the previous work-up, with special attention to potential cardiovascular risk factors, electrolytes, BUN, creatinine etc. in the ESRD patient. The peripheral vascular exam and the preoperative diagnostic studies are reviewed. Final informed consent is obtained from the patient following a review of surgical risks and benefits. Discussion is held with the anesthesiologist to determine the anesthetic of choice. Duplex vein mapping studies are reviewed to ensure patient has adequate length and caliber donor vein conduit, and discussions are held with OR nurses regarding appropriate draping to expose vein donor site and the implantation site. Other preoperative work includes marking the operative site, dressing, scrubbing, supervising patient positioning, moment of truth, waiting for the anesthetic to become effective, prepping, and draping the patient.

Description of Intra-Service Work:
Arterial Inflow Dissection: Incise skin overlying target inflow artery. Dissect soft tissue to expose artery, avoid injury to multiple nearby nerves & veins. Clear soft tissue from artery for ~6 cm length. Pass soft loops around artery for control.

Venous Outflow Dissection: Incise skin overlying previously identified outflow vein. Dissect soft tissue from around the vein, avoiding nerve/arterial injury. Pass soft rubber loops around artery for control. Create a tunnel from arterial dissection site to vein dissection site in subcutaneous tissue of the forearm.

Harvest Vein Conduit: Incise skin of thigh/calf over donor conduit vein (typically greater saphenous vein). Identify vein. Clear soft tissue from around vein for adequate length. Ligate and divide all vein branches. Ligate and divide ends of vein after double-checking to ensure adequate length has been harvested, and remove vein fr extremity. Test vein conduit for leaks & repair same as needed with 7-0 vascular suture.

Arterial Anastomosis: Anticoagulate patient with IV heparin and wait for circulation time. Apply vascular clamps to arterial anastomosis site on inflow artery. Perform arteriotomy. Perform most of vein conduit to inflow artery anastomosis with fine vascular suture. Open clamps transiently to flush system, remove air & debris. Complete anastomosis, remove arterial clamps. Apply additional sutures as needed to control hemorrhage. Pass vein conduit through tunnel to outflow vein anastomosis site with care to avoid twists/kinks.

Venous Outflow Anastomosis: Stretch vein conduit to full length. Apply vascular clamps. Perform venotomy. Cut vein conduit to match length and size of ventomy. Perform most of vein-to-vein anastomosis with fine vascular suture. Open clamps briefly to flush out air & debris. Complete anastomosis. Remove vascular clamps. Apply additional sutures as required to achieve hemostasis. Listen with Doppler and palpate distal pulses to assure fistula patency and assure continued flow to hand after completing the fistula. Irrigate all incisions. Achieve final wound hemostasis. Close all incisions in multiple layers. Recheck pulses to assure patency prior to application of sterile dressings

Description of Post-Service Work: Post-service work begins after skin closure. Tasks include apply dressings, transfer patient to stretcher, accompany patient to recovery area, write orders, dictate operative note, communicate with the patient's family, communicate with referring and consulting physicians, and participate with the anesthesiologist in the recovery area to ensure smooth emergence from anesthesia. Discuss results of procedure with patient once he/she is fully awake.

Depending on the preexisting comorbidities and operative course the patient may require full hospital admission overnight hospital stay, or same day discharge. The patient is transferred to the appropriate care setting when recove area discharge criteria are met.

If the patient is admitted to hospital or is required to remain in the facility overnight, an E&M service is provided at the end of the work day to assure that the patient is hemodynamically stable, to assess neurovascular status of the hand on the limb where the hemoaccess was created, and to assure there is no significant bleeding from either the arterial or venous anastomosis. Blood test evaluation and discussion with the nephrologist regarding need for hemodialysis is also typical.

During remainder of patient stay, the physician makes follow-up visits as clinically required, takes interval history, performs physical exam, makes assessment and plan, writes orders & notes, communicates with patient, family, nurses, and other care givers. Care it taken to ensure patency of the fistula in addition to adequate blood flow to hand. Discharge day management includes communicating with all support services including visiting nurses, meals on wheels, physical therapy, etc., communicating with referring physician, providing activity advice and warnings to patient and family, and arranging office follow up for wound checks, suture/staple removal, etc.

At follow-up office visits: Examine and talk with patient. Remove staples or sutures, when appropriate. Review activity and restrictions. Monitor healing of incision with appropriate physical examination, including dealing with questions of patient and family. Check for presence of post-operative hematoma/seroma. Check for patency of fistula and adequacy of blood flow to hand. Write medication prescriptions. Post discharge labs/films are ordered and reviewed. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart. Review activity permission with patient and write appropriate permission.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

RVW RECOMMENDATION: Our recommended RVW of 16.19 is mid-way between the survey 25th percentile (15.00) and the median survey value (18.00). It is constructed based on comparison to a very similar hemoaccess operation (36819) that has been RUC surveyed and also serves on the MPC-list.

HISTORY: 36825 was identified by the 5-year review ID workgroup in 2007 as a site-of-service anomaly because the Harvard inputs contained in-patient visits, yet the Medicare data suggested only 38% of cases were performed under true in-patient status. This was one of the few remaining vascular surgery services that had never undergone RUC survey, and we therefore conducted a survey in preparation for the February **2008** RUC meeting. Following initial presenta at Feb '08 RUC we requested the code be withdrawn until a discussion could be undertaken regarding procedures v overnight stays, the so-called 23hr-59min issue. For the Feb 2009 RUC meeting we re-surveyed this code. Interestingly, surveying the same code one year apart with different respondents yielded a slightly higher median RVW (18.00 now compared to 17.25 one year ago) and a slightly lower median intra-service time (120 min now compared to 140 min a year ago), with no major change in visits.

COMPELLING EVIDENCE: Since we believe an increase in RVW is indicated for this service that has not previously undergone RUC survey, we present compelling evidence:

1. Vascular Surgery was not recognized by Harvard As outlined in detail by Hertzer and Noether, the Hsiao/Harvard team that developed the RBRVS failed to recognize peripheral vascular surgery as a distinct discipline.[1] The physician work RVWs for 170 vascular surgery codes were extrapolated from surveys of only two peripheral vascular operations in Harvard Phase 1 (infrarenal aortic aneurysm repair and carotid endarterectomy). Upon thorough analysis of the Harvard/Hsiao extrapolations it became clear that physicians evaluating the vascular surgery services were not even obligated to have a working knowledge of the services as a condition for participation. The lack of an adequate basis for setting relative value work units for vascular services has been a widely acknowledged problem, resulting in reconsideration more than 100 vascular services during the first three 5-year reviews.

In the early phases of RBRVS development, peripheral vascular CPT codes were grouped with cardiac surgery. This was an especially unfortunate situation since cardiac operations (but not peripheral vascular procedures) had long been targets of critics who felt they were overcompensated. As a result, RVI assignments resulted in major reductions in Medicare payment. Medicare has since acknowledged tl cardiothoracic and vascular surgery procedures are fundamentally distinct, but in the late 1980s many physicians and non-physicians had difficulty understanding the difference between a "cardiothoracic surgeon" and a "vascular surgeon". Thus, it is not surprising that the initial physician RVWs in vascular surgery were low overall and contained undeniable rank order anomalies. As an example of an overt rank order anomaly within the initial vascular surgery RVWs, elective repair of an infrarenal aortic aneurysm extending into the iliac arteries and requiring a bifurcated prosthesis was assigned a lower RVW than tube graft repair of an aneurysm isolated to the infrarenal aorta.

Much the same is true for general surgery. The American College of Surgeons was not a participant in the Harvard studies that form the foundation of RBRVS. General surgery has therefore been working for 15-years, through three 5-year review processes to achieve parity. Like vascular, the general surgeons have submitted hundreds of services for review, with acknowledgement during each review that their services had been generally undervalued by Harvard. The current service is performed by general surgeons and vascular surgeons. While the RUC database states that it was considered in 1995 during the first 5-year review, the service did not undergo RUC survey, and only very sketchy details are presented under RUC rationale. We propose that 36825 has not undergone RUC survey and that it meets the compelling evidence threshold to be considered from a 5-year review perspective.

2. The work of this service has changed. While we believe this service was never valued correctly to begin with, the fact is that the work of 36825 has increased since inception of RBRVS. Numerous scientific publications have identified native autogenous hemodialysis access (such as 36825) as providing greater protection against infection in these very sick dialysis patients. This has become so important to CMS that th Agency created the Fistula First Breakthrough Initiative (FFBI), an entity that has been extremely influential urging surgeons to perform native autogenous access in an increasing percentage of dialysis patients. What this means is that surgeons are performing more and more complex operations to meet the CMS FFBI mandate.

[1] Hertzer NR, Noether MG. The resource-based relative value scale in vascular surgery. A report of the activities of the Joint Council of the Society for Vascular Surgery and the North American Chapter of the ISCVS. J Vasc Surg 1993; 18:692-701.

Therefore, while in earlier times surgeons would only perform native dialysis fistulas on the healthiest patients with large veins and normal arteries, the fact is that smaller and more diseased veins and arteries are being used to create native fistulas. This is reflected in greater skin-to-skin operative times and greater levels of complexity.

3. Fistula performance is now a Quality Performance Indicator. As indicated in the K-DOQI guidelines for hemodialysis access, and with support from the Fistula First Breakthrough Initiative, performance of native hemodialysis access fistulas such as 36825 is now a formal Quality Indicator based on consideration of the National Quality Foundation. This important step will push surgeons even more towards performing an increasing percentage of native fistulas with greater emphasis on functionality of the finished product. This all translates to more time, more intensity, and therefore, more work.

WHAT IS THE TYPICAL HOSPITAL STAY PATTERN? Our survey data indicate that this service is provided in three distinct hospital stay patterns. By survey, the plurality of patients (39%) undergoes formal hospital admission and retains in-patient status. This compares well to the 2007 RUC database Medicare hospital admission rate of 38%. Next most common pattern by survey is an overnight stay (35%), while least common is discharge from hospital on the same day, only 26%. We therefore concluded that presenting this code to the RUC as an everyday "outpatient" procedure would be inaccurate.

In fact, this range of hospital patterns makes it difficult to describe the "typical" patient in terms of hospital stay or physician work. If you believe the three patterns of hospital stay reflect different physician work – which we do – then the "most typical" patient would be admitted to the hospital. On the other hand, if you choose to lump overnight stay with same day discharge, then the lumped group is more common. It is important to state that the main driver of hospital stay is the number and severity of comorbidities in the elderly ESRD patient.

Based on the reality that post-op ESRD patients are fragile and require close attention to avoid calamity, and the fact that 74% of patients are physically in the hospital for two days, our recommendation for constructing this work RVU ncludes one 99231 inpatient visit plus one full 99238 discharge day service.

COMPARISON WITH KEY REFERENCE: 35522 was chosen as key reference service by 52% of respondents. It is a RUC-surveyed service with an RVW of 23.05. 35522 is a clinically similar upper extremity bypass graft that involves analogous surgical steps including dissection of arteries in the arm, harvest of vein conduit, and construction of two separate vascular anastomosis All this is done with vigilant avoidance of injury to adjacent arteries, nerves and veins in the upper extremity. Intensity and complexity measures of the two codes are very similar, as documented above. 35522 has a longer intra-service time than 36825 (180 vs. 120 minutes). 35522 also has two level two (99232) in-patient visits and one less office visit (99212) that are not in 36825. An RVW for 36825 can be estimated by starting with the RVW of the 35522 key reference (23.05) and subtracting the two 99232 hospital visits (-2.78), subtracting 60 minutes of intra-time at the IWPUT of that service (60x0.077=4.62), and adding the office visit (+0.45). The value calculates out to 23.05-2.78-4.62+0.45=16.10. Thus, straightforward comparison with the key reference service justifies an RVW for 36825of at least 16.10.

COMPARISON WITH MPC SERVICE: 36819 is an MPC list hemodialysis access service surveyed by the RUC in 1999. It has an RVW of 14.39. 36819 has the same intra-service time (120 min) as the just-surveyed 36825. In addition, both codes have one 99231 and one 99238. 36825 has one additional office visit (99213 – much older and sicker patient with leg incision in addition to arm incision). In addition 36825 has 25 extra pre-service minutes (older, sicker, must evaluate leg donor vein, hold, prep and drape leg) and 15 extra immediate post-service minutes (older, sicker, second incision, assure leg donor site dry, etc). Thus, an RVW for 36825 can be built by starting with the RVW for 36819 (14.39) and adding one 99213 (0.92) and 40 pre and post minutes at 0.022 RVUs/min (40*0.022 = 0.88. **We believe this calculation (14.39 + 0.92 + 0.88 = 16.19) is the best estimate of an accurate RVW for 36825.**

WPUT for the recommended RVW of 16.19 is 0.083, fully consistent with other native fistula hemodialysis access operations.

7-MINUTES EXTRA PRE-SERVICE TIME BEYOND PACKAGE: The typical patient for this last-gasp fistula operation is old and slow-moving. He/she needs to be positioned on the OR table such that two extremities (one arm &

one leg) can be sterilely prepped and remain fully accessible to the operating surgeon. Seven minutes of extra time is a conservative estimate.

INPATIENT VISIT ON THE DAY OF SURGERY: This operation is pretty much the end of the line in native fis procedures for the ESRD patient. The typical patient has undergone multiple prior hemoaccess operations an physiologically aged well beyond his 75 chronologic years. This is not the patient you tip your hat to on the way out the door at night. He or she requires a substantial assessment to ensure the fistula is patent, the hand beyond the fistula is not ischemic, and that all hemodynamic instability and electrolyte abnormalities have been avoided.

FULL DISCHARGE DAY: A full discharge visit (99238) is warranted for this service whether the patient goes home on the day of service or the day after. Discharge work includes a full neurovascular evaluation of the extremity, wound evaluation for potential hemorrhage, fistula evaluation to ensure patency, glycemic assessment, physical exam to ensure the IV fluid administered by anesthesia has not pushed patient into CHF, provision of wound care instructions, provision of warnings for vascular steal syndrome and/or vascular compromise of the hand, ensuring arrangements are made to reestablish outpatient hemodialysis, and finalization of many other details for this very sick subset of typically diabetic renal failure patients. Simply because the RUC "convention" is ½ discharge day for "outpatient" services, the RUC stated very clearly that if a full discharge day is justified, it can and should be assigned. We recommend one full 99238.

COMPARISON WITH OTHER HEMOACCESS OPERATIONS: 36825 is the most intense and complex hemoaccess service that employs native autogenous vein conduit for which a category I CPT code exists. Here is the current list of RUC-surveyed native access codes. 36825 deserves the highest RVW to avoid a rank order anomaly:

36818 Upper arm cephalic vein transposition	RVW 11.81
36819 Upper arm basilic vein transposition	RVW 14.39
36820 Forearm vein transposition	RVW 14.39
36821 Direct Cimino type fistula	RVW 12.00
36825 AV fistula by autogenous graft	RVW 16.19 recommended

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36825 is an existing Category I CPT code

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty GS How often? Rarely

Specialty VS How often? Rarely

Specialty TS/CTS How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 6000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Medicare data

Specialty GS Frequency 3100 Percentage 51.66 %

Specialty VS Frequency 1700 Percentage 28.33 %

Specialty TS/CTS Frequency 900 Percentage 15.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
6,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Medicare data

Specialty GS Frequency 3100 Percentage 51.66 %

Specialty VS Frequency 1700 Percentage 28.33 %

Specialty TS/CTS Frequency 900 Percentage 15.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 36819

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from the Five Year Review

February 2009

Parotid Tumor Excision

CPT codes 42415, *Excision of parotid tumor or parotid gland; lateral lobe, with dissection and preservation of facial nerve and 42420, Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve* were identified by the Five-Year Review Identification Workgroup as potentially misvalued through its Site of Service Anomaly screen in September 2007. The Workgroup reviewed all services that include inpatient hospital visits within their global periods, but are performed less than 50% of the time in the inpatient setting, according to recent Medicare utilization data. The RUC originally recommended a two-step action. First, the RUC removed the hospital visits from the service with no impact on the associated work RVU, which CMS agreed with. Second, the RUC recommended that services be surveyed. At the April 2008 RUC Meeting, the specialty societies presented data that indicate that although these procedures are reported as outpatient procedures more than 50% of the time, patients typically spend at least one night in the hospital. The RUC deferred action on these issues until an adequate survey instrument was developed. The RUC approved a revised survey instrument in October 2008 and these procedures were surveyed for review at the February 2009 RUC Meeting.

1784

42415
The specialty society agreed that there was not compelling evidence to support a review of the physician work in order to recommend a higher work RVU than is currently assigned to 42415. However, the specialty presented data from a survey of 76 otolaryngologists and general surgeons as well as consensus recommendations from an expert panel of otolaryngologists and general surgeons to validate physician time and post-operative visits. The survey results and expert panel consensus show that patients are typically kept overnight in the hospital following this procedure. The survey results indicated that 97% of respondents perform the procedure in the hospital. Of those 97% respondents, 91% stated that the patient stays overnight. The specialty society panel indicated pre-service time package four applied – facility, difficult patient, difficult procedure. The specialty societies indicated that an additional 9 minutes of positioning time is necessary to assist the patient with the shoulder roll, rotating and stabilizing the head. Further, the survey and panel, based on the survey median, recommended an intra-service time of 150 minutes and immediate post-service time of 20 minutes. Lastly, the specialty presented data that one 99238 discharge day management service, and one 99212 and two 99213 office visits are included. The RUC agreed with the specialty society survey results regarding physician time and post-operative visits. The RUC also compared 42415 to the key reference service, 60271, *Thyroidectomy, including substernal thyroid; cervical approach*, (work RVU =

17.54, intra-time = 150), which supports the current work RVU of 17.99. The RUC also noted that the survey 25th percentile work RVU was 18.00. **The RUC recommends the new physician times as well as hospital and office visits, but recommends maintaining the current work RVU of 17.99 for CPT code 42415.**

42420

The specialty society agreed that there was no compelling evidence to support a review of the physician work in order to recommend a higher work RVU than is currently assigned to 42420. However, the specialty presented data from a survey of 76 otolaryngologists and general surgeons as well as consensus recommendations from an expert panel of otolaryngologists and general surgeons to validate physician time and post-operative visits. The survey results and expert panel consensus show that patients are typically kept overnight in the hospital following this procedure. The survey results indicated that 100% of respondents perform the procedure in the hospital. Of those respondents, 98% stated that the patient stays overnight, and 62% stated that the patient stays longer than one day. The consensus panel indicated that the typical length of stay for this procedure is 3 days monitoring for airway patency, hematoma formation, facial nerve function, and control of pain and nausea is necessary. The specialty society survey and panel indicated pre-service time package four applied – facility, difficult patient, difficult procedure. The specialty societies indicated that an additional 9 minutes of positioning time is necessary to assist the patient with the shoulder roll, rotating and stabilizing the head. Further, the survey and panel, based on the survey median, recommended an intra-service time of 180 minutes and immediate post-service time of 20 minutes. Lastly, the specialty presented data that one 99231 hospital visit, one 99232 hospital visit, one 99238 discharge day management service, and one 99212 and two 99213 office visits are included. The RUC agreed with the specialty society survey results regarding physician time and post-operative visits. The RUC compared the 42420 to MPC code 35141, *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm, pseudoaneurysm, and associated occlusive disease, common femoral artery (profunda femoris, superficial femoral),* (work RVU = 20.83, intra-time = 150 minutes) and code 34471, *Thrombectomy, direct or with catheter; subclavian vein, by neck incision* (work RVU = 21.00 intra-service = 180) and agreed that the two services support the current work RVU of 20.87. The RUC also noted that the survey respondents indicated a median work RVU of 25.00 work RVUs and a 25th percentile of 23.36, comparing the work of 42420 to 38724, *Cervical lymphadenectomy (modified radical neck dissection)* (work RVU = 23.72). **The RUC recommends the new physician times as well as hospital and office visits, but recommends maintaining the current work RVU of 20.87 for CPT code 42420.**

1785

Practice Expense

The RUC recommends that the non-facility practice expense inputs be modified to reflect changes to the post-operative office visits and that the physician-assist time be modified to reflect changes to the intra-service time.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
42415		Excision of parotid tumor or parotid gland; lateral lobe, with dissection and preservation of facial nerve	090	17.99 (No Change)
42420		total, with dissection and preservation of facial nerve	090	20.87 (No Change)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old woman presents with a 2-year history of a slow growing 2 centimeter mass in the right preauricular region 1.5 centimeter anterior to the tragus. There is no pain, facial weakness, history of infection. A CT scan shows a mass in the superficial lobe of the parotid gland. Fine needle biopsy is compatible with a pleomorphic adenoma. A superficial parotidectomy with dissection and preservation of the facial nerve is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Percent of survey respondents who stated they perform the procedure; In the hospital 97% , In the ASC 3%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 9% , Kept overnight (less than 24 hours) 57% , Admitted (more than 24 hours) 34%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 43%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Assess need for beta-blockers, order as required. Review medical history, pathology, and radiology report. Review radiographic images. Review results of preoperative testing (labs, EKG, CXR). Review reports of consultants providing preoperative assessment and clearance as indicated. Meet with patient and family to review planned procedure and postoperative management. Reexamine patient to ensure that physical findings have not changed and dictate history and physical. Obtain informed consent. Review hospital consent, mark patient. Review airway and medical management with anesthesiologist. Review planned procedure with OR staff. Verify that all required instruments and supplies are available. Change into scrub clothes. Monitor/assist with positioning of the patient. Ensure that radiographic images are available in the OR. Mark planned incision. Inject planned incision with vasoconstrictor. Monitor/assist with prepping and draping. Scrub and gown. Perform surgical "time out" with operating surgical team.Place facial nerve monitor.

Description of Intra-Service Work: Under anesthesia, a preauricular incision is made with curved cervical extensi below the angle of the mandible. Anterior and posterior skin flaps are elevated in the subplatysmal plane, superficial the parotid fascia, exposing the parotid gland and the sternocleidomastoid muscle. The parotid gland is dissected from the anterior border of the sternocleidomastoid muscle and the greater auricular nerve is transected. The gland is dissected from the mastoid process and the cartilage of the external auditory canal. The main trunk of the facial nerve is identified and protected. Facial nerve stimulation is performed as needed at various points during the procedure. The

overlying parotid tissue is elevated from the main trunk of the facial nerve to expose the bifurcation. The peripheral branches of the facial nerve are sequentially dissected, separating the overlying parotid tissue from the facial nerve and deep lobe of the gland. The lobe and associated tissue are removed and sent to pathology. All structures are inspected including the facial nerve. A deep drain is placed and the wound closed in layers.

Description of Post-Service Work: Hospital: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Examine the patient to ensure proper drain function and assess facial nerve function. Write postoperative note. Dictate operative note and copy to referring physician. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Examine patient, check wound and patient progress - Monitor closely for airway patency and for development of cervical hematoma. Write orders for postoperative medications, diet, and patient activity. Check wounds, change dressings, and monitor patient progress. Chart notes. Review patient management with nursing staff. Monitor overall medical condition of the patient including fluid balance, vital signs, and urinary function. Monitor incision for signs of infection or hematoma. Assess facial nerve function. Answer patient and family questions. Answer nursing staff questions. Discuss patient progress with referring physician. Assure adequate level of pain control. Monitor drain, remove prior to discharge if appropriate. Chart discharge instructions. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family. Dictate discharge summary. Perform medication reconciliation. Office: Examine patient, remove sutures. Monitor output and remove drain if not removed prior to discharge. Answer patient and family questions. Review pathology report. Monitor facial nerve functional deficits, if any. Assess for adequacy of pain control. Discuss advancing daily activities with patient. Discuss long term scar management with patient. Discuss pathology report with patient and need for any additional testing or consultation. Arrange for any indicated additional testing and review results. Arrange for any indicated consultation, prepare documents for transmission to appropriate consultants, review reports from consultants. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart.

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.19	3.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.10	3.14
Urgency of medical decision making	2.86	2.81

Technical Skill/Physical Effort (Mean)

Technical skill required	4.29	4.10
Physical effort required	3.71	3.57

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.05	3.62
Outcome depends on the skill and judgment of physician	4.24	4.05
Estimated risk of malpractice suit with poor outcome	4.67	4.24

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.00	3.05
Intra-Service intensity/complexity	4.10	3.85
Post-Service intensity/complexity	2.57	2.65

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Va Recommendations for the appropriate formula and format.*

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change.

- Positioning: Add 9 minutes - After induction of anesthesia in supine position, assist with patient positioning with shoulder roll, head rotated and stabilized. Assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and head, adjust as needed.
- Scrub/Dress/Wait: no change

In comparison to the reference code 60271, the pre-service work for 42415 requires more time to review the planned procedure and the risks, including a detailed discussion of possible facial nerve paralysis (paresis is common), which may result in functional speech, mastication, and eye closure issues, as well as facial disfigurement; facial numbness and change in appearance at operative site (both of which always happen); facial scarring and possible need for revision, late sequelae including Frye's syndrome and tumor recurrence – an important issue even with benign tumors.

The intra-service time for 42415 and the reference code 60271 is the same (150 min), however, the intra-service intensity and complexity of 42415 is greater as seen in the survey mean intra-service intensity/complexity and all mean measures of technical skill and psychological stress statistics. The facial nerve is at risk during almost all parts of the procedure, including possible damage during flap raising, localization of main trunk, and dissection of peripheral branches, making this a high intensity procedure throughout. The nerve buried in the middle of the parotid gland, which is dense, fibrous, and vascular is difficult to find, difficult to dissect, easy to injure – even with gentle traction or nerve stimulation. Facial nerve injury results in significant functional issues related to speech, mastication, and eye closure as well as facial disfigurement. For the reference code, nerve dissection is more limited, and separating the nerve from the gland is less prone to injury. Unlike the thyroid (60271), even benign tumors of the parotid are prone to recurrence, requiring more attention to wide margins, and meticulous handling to prevent tumor cell seeding of the operative site. The survey data indicate a majority of patients are treated in the hospital and a majority will stay at least overnight. The typical patient will require monitoring for hematoma formation and facial nerve function, control pain and nausea, maintenance of hydration with IV fluids. The next day, the surgeon will change dressing, assess facial nerve function and prescribe indicated treatment for deficits, particularly related to eye closure. The wound and drain are assessed. If the patient is stable, he/she will be discharged.

Office work for 42415 is greater than the reference code. An additional office visit 1-2 days after discharge is necessary because patients undergoing 42145 typically go home with a drain (unlike thyroid). At all office visits, facial nerve function and counseling is important.

A Harvard-based code is not a RUC compelling evidence standard. Consequently, we are not asking the RUC for consideration of a change to the RVW for 42415. However, we would like to reserve the option to review this code at a later time, if Harvard-based becomes a compelling evidence standard. The discussion above which compares 42415 to the reference code supports maintaining the current value of 17.99 RVUs for 42415. As additional justification, we also offer two MPC codes (22554 and 34203) with similar RVWs, significantly less intra-op time, but greater hospital work. Another comparison code that is not an MPC code but is similar in terms of anatomy is 60260 with a slightly higher RVW (18.18) and more hospital work, but less office work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 42415

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty otolaryngology How often? Sometimes

Specialty general surgery How often? Rarely

Specialty How often?

SUMMARY OF RECOMMENDATION

CPT Code:42420 Tracking Number Specialty Society Recommended RVU: **20.87**

Global Period: 090 RUC Recommended RVU: **20.87**

CPT Descriptor: Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old man presents with a 12-month history of a 1.5 centimeter left preauricular mass. Over the past 3 months, he has had increasing pain but has no evidence of facial nerve weakness. There is no palpable cervical adenopathy. An MRI shows a mass with irregular borders, in the deep lobe of the parotid gland. There is no adenopathy noted on the scan. A fine needle biopsy reveals squamous cell carcinoma. The patient undergoes a total parotidectomy with dissection and preservation of the facial nerve.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 3% , Kept overnight (less than 24 hours) 36% , Admitted (more than 24 hours) 62%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 56%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Assess need for beta-blockers, order as required. Review medical history, pathology, and radiology report. Review radiographic images. Review results of preoperative testing (labs, EKG, CXR). Review reports of consultants providing preoperative assessment and clearance as indicated. Meet with patient and family to review planned procedure and postoperative management. Reexamine patient to ensure that physical findings have not changed and dictate history and physical. Obtain informed consent. Review hospital consent, mark patient. Review airway and medical management with anesthesiologist. Review planned procedure with OR staff. Verify that all required instruments and supplies are available. Change into scrub clothes. Monitor/assist with positioning of the patient. Ensure that radiographic images are available in the OR. Mark planned incision. Inject planned incision with vasoconstrictor. Monitor/assist with prepping and draping. Scrub and gown. Perform surgical "time out" with operating surgical team.Place facial nerve monitor.

escription of Intra-Service Work: Under anesthesia, a preauricular incision is made with curved cervical extension below the angle of the mandible. Anterior and posterior skin flaps are elevated in the subplatysmal plane, superficial to the parotid fascia, exposing the parotid gland and the sternocleidomastoid muscle. The parotid gland is dissected from the anterior border of the sternocleidomastoid muscle and the greater auricular nerve is transected. The gland is dissected from the mastoid process and the cartilage of the external auditory canal. The main trunk of the facial nerve is

identified and protected. Facial nerve stimulation is performed as needed at various points during the procedure. The overlying parotid tissue is elevated from the main trunk of the facial nerve to expose the bifurcation. The peripheral branches of the facial nerve are sequentially dissected, separating the overlying parotid tissue from the facial nerve and deep lobe of the gland. The facial nerve is mobilized and gently retracted. The lobe and associated tissue are remo and sent to pathology. All structures are inspected including the facial nerve. A deep drain is placed and the wc closed in layers.

Description of Post-Service Work: Hospital: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Examine the patient to ensure proper drain function and assess facial nerve function. Write postoperative note. Dictate operative note and copy to referring physician. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Examine patient, check wound and patient progress - Monitor closely for airway patency and for development of cervical hematoma. Write orders for postoperative medications, diet, and patient activity. Check wounds, change dressings, and monitor patient progress. Chart notes. Review patient management with nursing staff. Monitor overall medical condition of the patient including fluid balance, vital signs, and urinary function. Monitor incision for signs of infection or hematoma. Assess facial nerve function. Answer patient and family questions. Answer nursing staff questions. Discuss patient progress with referring physician. Assure adequate level of pain control. Monitor drain, remove prior to discharge if appropriate. Chart discharge instructions. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family. Dictate discharge summary. Perform medication reconciliation.

Office: Examine patient, remove sutures. Monitor output and remove drain if not removed prior to discharge. Answer patient and family questions. Review pathology report. Monitor facial nerve functional deficits, if any. Assess for adequacy of pain control. Discuss advancing daily activities with patient. Discuss long term scar management with patient. Discuss pathology report with patient and need for any additional testing or consultation. Arrange for any indicated additional testing and review results. Arrange for any indicated consultation, prepare documents fo transmission to appropriate consultants, review reports from consultants. Discuss progress with referring physiciar (verbal and written). Dictate progress notes for medical chart.

Technical skill required	4.83	4.57
Physical effort required	4.39	4.17

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.83	4.43
Outcome depends on the skill and judgment of physician	4.74	4.30
Estimated risk of malpractice suit with poor outcome	4.74	4.17

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	4.13	4.04
Intra-Service intensity/complexity	4.74	4.52
Post-Service intensity/complexity	3.39	3.57

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

re-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: no change.
- Positioning: Add 9 minutes - After induction of anesthesia in supine position, assist with patient positioning with shoulder roll, head rotated and stabilized. Assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and head, adjust as needed.

- Scrub/Dress/Wait: no change

For both the survey code and reference code, the risk of nerve dysfunction, functional and cosmetic issues are significant. The intra-service time for 42420 and the reference code 38724 is the same (180 min), however, the intra-service intensity and complexity of 42420 is greater as seen in the survey mean intra-service intensity/complexity and all mean measures of technical skill and psychological stress statistics. The facial nerve is at risk during almost all parts of the procedure, including possible damage during flap raising, localization of main trunk, and dissection of peripheral branches, making this a high intensity procedure throughout. The nerve buried in the middle of the parotid gland, which is dense, fibrous, and vascular is difficult to find, difficult to dissect, easy to injure - even with gentle traction or nerve stimulation. 42420 involves dissecting the nerve away from not only the superficial lobe, but on the underside from the deep lobe, with increased risk of injury. Deep lobe tumors are often malignant, resulting in increased technical difficulty to dissect the nerve free and more complex intraoperative decision-making regarding nerve preservation. Facial nerve injury results in significant functional issues related to speech, mastication, and eye closure as well as facial disfigurement. With 38724, nerve dissection is more limited, and nerves are less prone to injury. Similar to 38724, tumors of the parotid are prone to recurrence, requiring attention to wide margins, and meticulous handling to prevent tumor cell seeding of the operative site.

The survey data indicate and we concur that these patients are typically admitted to the hospital and will remain for several days. Monitoring for airway patency, hematoma formation, facial nerve function and intervention for any noted deficits, drain function, and control of pain and nausea is necessary. Patients are maintained on IV fluids until oral intake is possible. The patient will go home with the drain in place and require a visit 1-2 days after discharge for drain removal if appropriate.

A Harvard-based code is not a RUC compelling evidence standard. Consequently, we are not asking the RUC for consideration of a change to the RVW for 42420. However, we would like to reserve the option to review this code at a later time, if Harvard-based becomes a compelling evidence standard. The discussion above which compares 42420 to the reference code supports maintaining the current value of 20.87 RVUs for 42420. As additional justification, we also offer two MPC codes (35656 and 35141) with similar RVWs and similar total time (less intra-time, more hospital work, and less office work). Another comparison code that is not an MPC code but is similar in terms of anatomy is 60252 with a slightly higher RVW (21.88), the same intra-op time, but slightly more post-op work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 42420

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty otolaryngology How often? Sometimes

Specialty general surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. national frequency unavailable

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
1,590 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. RUC database 2006 frequency

Specialty otolaryngology Frequency 1475 Percentage 92.76 %

Specialty general surgery Frequency 45 Percentage 2.83 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Maintain PLI for current code 42420

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from the Five Year Review

February 2009

Hernia Repair

CPT codes 49507, *Repair initial inguinal hernia, age 5 years or older; incarcerated or strangulated*, 49521, *Repair recurrent inguinal hernia, any age; incarcerated or strangulated*, and 49587, *Repair umbilical hernia, age 5 years or older; incarcerated or strangulated* were identified by the Five-Year Review Identification Workgroup as potentially misvalued through its Site of Service Anomaly screen in September 2007. The Workgroup reviewed all services that include inpatient hospital visits within their global periods, but are performed less than 50% of the time in the inpatient setting, according to recent Medicare utilization data. The RUC originally recommended a two-step action. First, the RUC removed the hospital visits from the service with no impact on the associated work RVU, which CMS agreed with. Second, the RUC recommended that services be surveyed. At the April 2008 RUC Meeting, the specialty societies presented data that indicate that although these procedures are reported as outpatient procedures more than 50% of the time, patients typically spend at least one night in the hospital. The RUC deferred action on these issues until an adequate survey instrument was developed. The RUC approved a revised survey instrument in October 2008 and these procedures were surveyed for review at the February 2009 RUC Meeting.

1804

49507

The specialty society agreed that there was no compelling evidence to support a review of the physician work in order to recommend a higher work RVU than is currently assigned to 49507. However, the specialty presented data from a survey of 84 general surgeons and consensus recommendations from an expert panel of general surgeons to validate physician time and post-operative visits. The survey results and expert panel consensus show that patients are typically kept overnight in the hospital following this procedure. The survey results indicated that 98% of respondents perform the procedure in the hospital. Of those 98%, 83% stay overnight, and of those 83%, 73% (or 59% of all patients) are seen for an evaluation and management visit on the same day. The surveyees and the specialty expert panel noted and the RUC agreed that typically patients require close monitoring the day of and the day after the procedure for problems such as ileus, intestinal ischemia, and urinary retention. There is also a significant amount of pain management. A patient will not be discharged until there is a return of bowel function, the patient is taking adequate nutrition, and there is adequate pain control with oral analgesics. The specialty society panel indicated pre-service time package four applied – facility, difficult patient, difficult procedure. Further, the survey and panel recommended an intra-service time of 70 minutes and immediate post-service time of 30 minutes. Lastly, the specialty presented data that one 99231 hospital visit, one 99238 discharge day

management service, and one 99212 and one 99213 office visits are included. The RUC agreed with the specialty society survey results regarding physician time and post-operative visits. The RUC compared 49507 to the key reference service 49505, *Repair initial inguinal hernia, age 5 years or older; reducible* (work RVU = 7.88 intra-time = 70 minutes). The RUC also compared 49507 to 54512, Excision of extraparenchymal lesion of testis (work RVU = 9.22, pre-time = 50 minutes, intra-time = 70 minutes, post-service = 30) and noted that there is more pre-service time in the surveyed code (63 versus 50 minutes) accounting for the slight difference in work RVU. The RUC noted that the reference service contains less pre-service and immediate post-service and is less intense than the surveyed code. The RUC also noted that the 25th percentile survey work RVU was 9.91 and the median work RVU was 11.00. **The RUC recommends the new physician times as well as hospital and office visits, but recommends maintaining the current work RVU of 9.97 for CPT code 49507.**

49521

The specialty society agreed that there was not compelling evidence to support a review of the physician work in order to recommend a higher work RVU than is currently assigned to 49521. However, the specialty presented data from a survey of 84 general surgeons and consensus recommendations from an expert panel of general surgeons to validate physician time and post-operative visits. The survey results and expert panel consensus show that patients are typically kept overnight in the hospital following this procedure. The survey results indicated that 99% of respondents perform the procedure in the hospital. Of those 99%, 82% stay overnight, and of those 82%, 68% (or 55% of all patients) are seen for an evaluation and management visit on the same day. The surveyees and the specialty expert panel noted and the RUC agreed that typically patients require close monitoring the day of and the day after the procedure for problems such as ileus, intestinal ischemia, and urinary retention. There is also a significant amount of pain management. A patient will not be discharged until there is a return of bowel function, the patient is taking adequate nutrition, and there is adequate pain control with oral analgesics. The specialty society panel indicated pre-service time package four applied – facility, difficult patient, difficult procedure. Further, the survey and panel recommended an intra-service time of 90 minutes and immediate post-service time of 30 minutes. During the immediate post-service work, the physician protects the wound with a hand while the patient comes out of anesthesia so that an unrestrained cough does not disrupt the repair. Lastly, the specialty presented data that one 99231 hospital visit, one 99238 discharge day management service, and one 99212 and one 99213 office visits are included. The RUC agreed with the specialty society survey results regarding physician time and post-operative visits. The RUC compared 49521 to the key reference service, 49520, *Repair recurrent inguinal hernia, any age; reducible*, (work RVU = 9.91, intra-service time = 60 minutes). The RUC noted that it contained 30 minutes less intra-service time and requires less intensity and complexity that the surveyed code. The RUC also compared 49521 to 49652, *Laparoscopy, surgical, repair, ventral, umbilical, spigelian or epigastric hernia (includes mesh insertion, when performed); reducible* (work RVU = 12.80, pre-time = 75, intra-time = 90, immediate post-time = 30) and noted that the two codes are similar and have identical intra- and immediate post-service time, but that the reference code has slightly more pre-service time accounting for the difference in work RVU. The RUC also noted that the survey

respondents indicated a median work RVU of 14.00 and a 25th percentile work RVU of 11.00. **The RUC recommends the new physician times as well as hospital and office visits, but recommends maintaining the current work RVU of 12.36 for CPT code 49521.**

49587

The specialty society agreed that there was not compelling evidence to support a review of the physician work in order to recommend a higher work RVU than is currently assigned to 49587. However, the specialty presented data from a survey of 84 general surgeons and consensus recommendations from an expert panel of general surgeons to validate physician time and post-operative visits. The survey results and expert panel consensus show that patients are typically kept overnight in the hospital following this procedure. The survey results indicated that 100% of respondents perform the procedure in the hospital. Of those, 71% stay overnight, and of those 71%, 77% (or 55% of all patients) are seen for an evaluation and management visit on the same day. The surveyees and the specialty expert panel noted and the RUC agreed that typically patients require close monitoring the day of and the day after the procedure for problems such as ileus, intestinal ischemia, and urinary retention. There is also a significant amount of pain management. A patient will not be discharged until there is a return of bowel function, the patient is taking adequate nutrition, and there is adequate pain control with oral analgesics. The specialty society panel indicated pre-service time package four applied – facility, difficult patient, difficult procedure. Further, the survey and panel recommended an intra-service time of 60 minutes and immediate post-service time of 30 minutes. Lastly, the specialty presented data that one 99231 hospital visit, one 99238 discharge day management service, and one 99212 and one 99213 office visits are included. The RUC agreed with the specialty society survey results regarding physician time and post-operative visits. The RUC compared 49587 to the key reference service, 49585, *Repair umbilical hernia, age 5 years or older; reducible*, (work RVU = 6.51, intra-service time = 45 minutes). The RUC noted that the reference service requires 15 fewer minutes and requires less intensity and complexity than the surveyed code. The RUC also compared 49587 to 49572, *Repair epigastric hernia (eg, preperitoneal fat); incarcerated or strangulated* (work RVU = 7.79, pre-time = 45 intra-time = 60, immediate post-time = 30). The RUC agreed that the two codes are similar, but that the difference in intra-service accounts for the slight difference in work RVUs. The RUC also noted that the survey respondents indicated a median work RVU of 11.50 work RVUs. **The RUC recommends the new physician times as well as hospital and office visits, but recommends maintaining the current work RVU of 7.96 for CPT code 49587.**

1806

Practice Expense

The RUC recommends that the non-facility practice expense inputs be modified to reflect changes to the post-operative office visits and that the physician-assist time be modified to reflect changes to the intra-service time.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
49507	Repair initial inguinal hernia, age 5 years or older; incarcerated or strangulated	090	9.97 (No Change)
49521	Repair recurrent inguinal hernia, any age; incarcerated or strangulated	090	12.36 (No Change)
49587	Repair umbilical hernia, age 5 years or older; incarcerated or strangulated	090	7.96 (No Change)

1807

SUMMARY OF RECOMMENDATION

CPT Code:49507 Tracking Number Specialty Society Recommended RVU: **9.97**

Global Period: 090 RUC Recommended RVU: **9.97**

CPT Descriptor: Repair initial inguinal hernia, age 5 years or over; incarcerated or strangulated

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male presents with 2 hour history of painful swelling in the left groin. Physical exam reveals an inguinal hernia that is tender and nonreducible by manual manipulation. He undergoes operative reduction and repair.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Percent of survey respondents who stated they perform the procedure; In the hospital 98% , In the ASC 2%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 17% , Kept overnight (less than 24 hours) 40% , Admitted (more than 24 hours) 43%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 73%

.s moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Assess need for beta-blockers, order as required. Review preadmission work-up, with particular attention to imaging information and reports. Reexamine patient to make sure that physical findings have not changed, that the hernia remains unreducible, and update H&P. Review results of preadmission testing (lab, EKG, chest x-ray, availability of blood products). Meet with patient and family to review planned procedure and post-operative management.. Review and obtain informed consent, including the possiblity of bowel resection, with witness. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available Assist in transfer of patient from gurney to operating table. Monitor/assist with positioning of patient. Install or supervise installation of Foley catheter Assist anesthesia team with line placement and induction of anesthesia and intubation. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Incision is made through skin and subcutaneous tissue taking care not to injure the nderlying bowel that is incarcerated. Dissection carried out meticulously around the hernia sac to expose the external .scial ring. Incision is then made in the external oblique fascia taking care to preserve the ilioinguinal nerve. Flaps of the external oblique fascia are made to expose underside of Poupart's ligament laterally and the internal oblique muscle medially. The defect whether direct or indirect is then determined in relation to epigastric vessels and the transversalis fascia. The neck of the hernia sac is then released to allow pressure on the hernia sac contents to be lessened. The vas deferens and spermatic vessels are carefully dissected from the hernia sac. The hernia sac is then opened to facilitate

examination of the incarcerated hernia sac contents. The viability of the bowel is assessed. If bowel resection is indicated, it is performed (reported separately). If no resection is required, the bowel is meticulously inspected, allowed to partially reduce and reinspected to ensure that it is likely viable. The operative site is then assessed to determine ability to place mesh and the potential infection risk. Once the bowel is reduced, the peritoneum of the hernia sac circumferentially dissected (or resected if there is excess) and oversewn. The cord structures are carefully dissected retracted to prevent injury to the Vas Deferens and vessels. The inguinal ligament, inguinal floor and conjoined tendon are defined. Mesh is placed either to plug the defect or as an onlay patch or a combination. The mesh is sutured in place to Poupart ligament and the medial conjoined tendon. A new internal ring is created as mesh encircles the spermatic vessels and vas deferens taking care to not compromise the structures to prevent injury or necrosis. Finally the mesh is placed under the internal oblique muscle to prevent recurrence. Hemostasis is obtained. The external oblique fascia is reapproximated with care to avoid ilioinguinal nerve injury, entrapment, and significant chronic pain. The wound is irrigated. The Scarpa's fascia is reapproximated and the skin is closed. Sponge, needle, and instrument counts are obtained and confirmed prior to closure.

Description of Post-Service Work: Hospital: Apply sterile adhesive strips and dressings. Monitor patient during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough on emergence from anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discontinue prophylactic antibiotic therapy, as appropriate. Review post-operative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with floor nurses. Examine patient, including reviewing vital signs and confirming as necessary. Auscultate heart, lungs, and abdomen for bowel sounds. Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection. Continue prophylaxis for DVT. Monitor daily for adequacy. Assess need for beta-blockers, order as required. Monitor and document patient progress. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status and renal function. Review nursing/other staff patient chart notes. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes, daily. Answer patient & family questions. Answer nursing/other staff questions. Advance diet, as appropriate. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels (i.e., diet, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is return of bowel function, taking adequate nutrition, and adequate pain control with oral analgesics. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

At follow-up office visits: Examine and talk with patient. Remove staples or sutures, when appropriate. Review activity and restrictions. Monitor healing of incision with appropriate physical examination, including dealing with questions of patient and family. Check for presence of post-operative hematoma/seroma and assess need for aspiration. Arrange to return for review if necessary. Monitor diet caloric intake by weight. Answer patient/family questions. Write medication prescriptions. Post discharge labs/films are ordered and reviewed. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart. Review activity permission with patient and write appropriate permission.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Coding changes were made to the family of hernia codes for CPT 1994 to differentiate physician work. A request was made to separate incarcerated and strangulated hernias, but the CPT Editorial Panel chose to combine those procedures. The RUC process in 1993 utilized consistent ratios for valuing reducible, incarcerated/strangulated, initial, and recurrent for each type of hernia, with a goal of maintaining budget neutrality across all hernia codes. In 2000, during the 2nd 5 year review, the hernia codes were surveyed as minisurveys (except for 49505) and the work RVUs adjusted using the

percentage change made to 49505, which underwent a full RUC survey. Many of the more difficult procedures had evidence to support higher values, but the details of the mini-surveys were not reviewed on a code-by-code basis.

For code 49507, the 2006 Medicare claims data in the RUC database indicate 48% inpatient hospital and 48% outpatient hospital. The 2007 Medicare claims data show a slight change to 46% inpatient and 48% outpatient, along with a slight decrease in total frequency. Our current survey indicates a close split between hospital admit and overnight. For the respondents that indicated an overnight stay, a majority indicated an E/M service would be performed on the same day (73%).

The survey data show - and our expert consensus panel concurs - that a majority of these patients require close monitoring on the day of the procedure and are kept in the hospital for continued monitoring for problems such as ileus, intestinal ischemia, and urinary retention. Additionally, there will be significant pain post-operatively requiring management before discharge. After considering relevant data, options, and risks on the day following surgery, the surgeon will make the decision for the patient to stay in the hospital or to be discharged. The patient will not be discharged until there is return of bowel function, the patient is taking adequate nutrition, and there is adequate pain control with oral analgesics. Clearly, if on the day of surgery, the surgeon's orders are to admit the patient, follow-up hospital E/M visit(s) that occur should be considered part of the typical global work. This is independent of whether the post-discharge "billing status" for a patient changes from admit to outpatient the next day because the patient is discharged "within" 24 hours.

We believe that semantics about place of service and length of stay have created an undo concern with regard to screening, reviewing and accounting for physician work. Medicare representatives have stated that a claim designated as "outpatient" is a hospital stay of 23hr-59min or less. On the other hand, CPT codes describe E/M codes in a less concrete fashion. For example, codes 99201-99205 and 99211-99215 describe E/M services provided in the physician's office or in an outpatient or other ambulatory facility. These place of service designations are not consistent with patients staying overnight or longer on a hospital surgical ward. We would argue that a hospital surgical ward is not "ambulatory." Further, CPT indicates that codes 99234-99236 are to be used to report observation or inpatient hospital care services provided to patients admitted and discharged on the same date of service. For these codes, claims can correctly be submitted as inpatient same day service and in 2006, Medicare claims data show more than 50% inpatient claims for 99234. Clearly, 50%+ of these 71,000+ patients were not admitted at 12:00am and discharged at midnight – which according to Medicare is the only way that a claim can be considered inpatient.

All of the discussion above is meant to emphasize that reason needs to prevail in the discussion about accounting for physician work for patients who are not ambulatory and do not leave a hospital outpatient surgery center on the day of a procedure, but instead are admitted to the surgical ward. A claim's place of service designation does not relate to or accurately describe physician work. If 50% of claims for same day E/M work can have a place of service designation as inpatient, then some percentage of claims with a place of service designation of outpatient can be patients staying overnight (or longer). Discussion of clinical rationale and professional judgment is important to the review process – not just a claim's place of service designation.

The site of service screen used for 49507 inaccurately portrays these patients as typically ambulatory and leaving a facility on the same date of service. OPPS data for this code includes claims where patients were admitted and discharged on different dates. The current RUC survey indicates that the typical patient is admitted or kept overnight and that an E/M visit is performed on the day of the procedure. An expert panel of general surgeons representing all geographic practice settings and all types of practices have reviewed the survey data for this code and believe that the clinical rationale discussed above justifies admitting a majority of these patients. **We recommend maintaining the current work RVU of 9.97. We also recommend the survey median time and visits which include E/M work on the day of the procedure and 1 x 99238 for the discharge work provided the next day, if the patient can safely be released from the hospital.**

With respect to the E/M work on the day of the procedure, we believe the typical service is equivalent to 99231 because the typical patient is admitted to the surgical ward by the surgeon's orders and until the patient is discharged, the work being performed is inpatient. However, if semantics require use of different codes, then we might suggest using the following two codes as proxies: 99218 *Observation care* for work on the day of the procedure and 99217 *Observation care discharge* for work the following day. The use of these proxies will require a change to the SoR and the RUC database because these codes are not currently identified. However, we do not suggest adding these codes – which would only be proxies for work – to the RUC survey.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 49507

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Global Period: 090 RUC Recommended RVU: **12.36**

CPT Descriptor: Repair recurrent inguinal hernia, any age; incarcerated or strangulated

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male with a history of right inguinal hernia repair with mesh five years ago, now presents with a progressive history of painful swelling in the right groin. Physical exam reveals an inguinal mass that is tender and nonreducible by manual manipulation. He undergoes operative reduction and repair.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Percent of survey respondents who stated they perform the procedure; In the hospital 99% , In the ASC 1%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 18% , Kept overnight (less than 24 hours) 37% , Admitted (more than 24 hours) 45%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 68%

.s moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Assess need for beta-blockers, order as required. Review preadmission work-up, with particular attention to imaging information and reports. Reexamine patient to make sure that physical findings have not changed, that the hernia remains unreducible, and update H&P. Review results of preadmission testing (lab, EKG, chest x-ray, availability of blood products). Meet with patient and family to review planned procedure and post-operative management.. Review and obtain informed consent, including the possiblity of bowel resection, with witness. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available Assist in transfer of patient from gurney to operating table. Monitor/assist with positioning of patient. Install or supervise installation of Foley catheter Assist anesthesia team with line placement and induction of anesthesia and intubation. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Incision is made through previous skin scar and subcutaneous tissue taking care not injure the underlying bowel that is incarcerated. Dissection carried out meticulously around the hernia sac to expose .e external fascial ring. Lateral landmarks for inguinal ligament are identified to provide orientation in the reoperative field. Incision is then made in the previously incised external oblique fascia taking care to preserve the ilioinguinal nerve. Flaps of the external oblique fascia through the scar tissue are made to expose the underside of Poupart's ligament laterally and the internal oblique muscle medially. The previous mesh and inherent adhesive reaction are assessed in order to define the hernia defect and the spermatic cord. The defect is then defined in relation to epigastric

vessels and the transversalis fascia. The scar tissue around the neck of the hernia sac is then released to allow pressure on the hernia sac contents to be lessened. The vas deferens and spermatic vessels are carefully dissected from the hernia sac. The hernia sac is then opened to facilitate examination of the incarcerated hernia sac contents. The viability of the bowel is then assessed. If bowel resection is indicated, it is performed (reported separately). If no resection is requir the bowel is reduced into the abdomen and the degree of ischemia is assessed to determine ability to place mesh and potential infection risk. The old mesh is not removed as it is normally intensely incorporated into the tissue. Once the bowel is reduced, the peritoneum of the hernia sac is circumferentially dissected, resected if there is excess and oversewn. The cord structures are carefully dissected and retracted to prevent injury to the Vas Deferens and vessels. The inguinal ligament, inguinal floor and conjoined tendon are defined. Mesh is placed either to plug defect or as an onlay patch or a combination. The mesh is sutured in place to the defect. A new internal ring is created as mesh encircles the spermatic vessels and vas deferens taking care to not compromise the structures to prevent injury or necrosis. Finally the mesh is placed under the internal oblique muscle to prevent against recurrence. Hemostasis is obtained. The external oblique fascia is reapproximated with care to avoid ilioinguinal nerve injury, entrapment, and significant chronic pain. The wound is irrigated. The Scarpa's fascia is reapproximated and the skin is closed. Sponge, needle, and instrument counts are obtained and confirmed prior to closure.

Description of Post-Service Work: Hospital: Apply sterile adhesive strips and dressings. Monitor patient during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough on emergence from anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discontinue prophylactic antibiotic therapy as appropriate. Instruct nursing staff in care of tubes and other devices. Review post-operative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with floor nurses. Examine patient, including reviewing vital signs and confirming as necessary. Auscultate heart, lungs, and abdomen for bowel sounds. Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection. Continue prophylaxis for DVT. Monitor daily for adequacy. Assess need for beta-blockers, order as required. Monitor and document patient progress. Asse pain scores and adequacy of analgesia. Monitor fluid and electrolyte status and renal function. Review nursing/othe staff patient chart notes. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes, daily. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity (i.e., diet, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is return of bowel function, taking adequate nutrition, and adequate pain control with oral analgesics. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

At follow-up office visits: Examine and talk with patient. Remove staples or sutures, when appropriate. Review activity and restrictions. Monitor healing of incision with appropriate physical examination, including dealing with questions of patient and family. Check for presence of post-operative hematoma/seroma and assess need for aspiration. Arrange to return for review if necessary. Monitor diet caloric intake by weight. Answer patient/family questions. Write medication prescriptions. Post discharge labs/films are ordered and reviewed. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart. Review activity permission with patient and write appropriate permission.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Coding changes were made to the family of hernia codes for CPT 1994 to differentiate physician work. A request was made to separate incarcerated and strangulated hernias, but the CPT Editorial Panel chose to combine those procedures. The RUC process in 1993 utilized consistent ratios for valuing reducible, incarcerated/strangulated, initial, and recurrent for each type of hernia, with a goal of maintaining budget neutrality across all hernia codes. In 2000, during the 2nd 5 year review, the hernia codes were surveyed as mini surveys (except for 49505) and the work RVUs adjusted using the

percentage change made to 49505, which underwent a full RUC survey. Many of the more difficult procedures had evidence to support higher values, but the details of the mini-surveys were not reviewed on a code-by-code basis.

For code 49521, the 2006 Medicare claims data in the RUC database indicate 43% inpatient hospital and 52% outpatient hospital. The 2007 Medicare claims data show a change to **greater** inpatient 46% and less outpatient 49%, along with a slight decrease in total frequency. Our current survey indicates a greater frequency of hospital admit than overnight (45% vs 37%). For the respondents that indicated an overnight stay, a majority indicated an E/M service would be performed on the same day (68%).

The survey data show - and our expert consensus panel concurs - that a majority of these patients require close monitoring on the day of the procedure and are kept in the hospital for continued monitoring for problems such as ileus, ischemia, and urinary retention. Additionally, there will be severe pain post-operatively requiring management before discharge. After considering relevant data, options, and risks on the day following surgery, the surgeon will make the decision for the patient to stay in the hospital or to be discharged. The patient will not be discharged until there is return of bowel function, the patient is taking adequate nutrition, and there is adequate pain control with oral analgesics. Clearly, if on the day of surgery, the surgeon's orders are to admit the patient, follow-up hospital E/M visit(s) that occur should be considered part of the typical global work. This is independent of whether the post-discharge "billing status" for a patient changes from admit to outpatient the next day because the patient is discharged "within" 24 hours.

We believe that semantics about place of service and length of stay have created an undo concern with regard to screening, reviewing and accounting for physician work. Medicare representatives have stated that a claim designated as "outpatient" is a hospital stay of 23hr-59min or less. On the other hand, CPT codes describe E/M codes in a less concrete fashion. For example, codes 99201-99205 and 99211-99215 describe E/M services provided in the physician's office or in an outpatient or other ambulatory facility. These place of service designations are not consistent with patients staying overnight or longer on a hospital surgical ward. We would argue that a hospital surgical ward is not "ambulatory." Further, CPT indicates that codes 99234-99236 are to be used to report observation or inpatient hospital care services provided to patients admitted and discharged on the same date of service. For these codes, claims can correctly be submitted as inpatient same day service and in 2006, Medicare claims data show more than 50% inpatient claims for 99234. Clearly, 50%+ of these 71,000+ patients were not admitted at 12:00am and discharged at midnight – which according to Medicare is the only way that a claim can be considered inpatient.

All of the discussion above is meant to emphasize that reason needs to prevail in the discussion about accounting for physician work for patients who are not ambulatory and do not leave a hospital outpatient surgery center on the day of a procedure, but instead are admitted to the surgical ward. A claim's place of service designation does not relate to or accurately describe physician work. If 50% of claims for same day E/M work can have a place of service designation as inpatient, then some percentage of claims with a place of service designation of outpatient can be patients staying overnight (or longer). Discussion of clinical rationale and professional judgment is important to the review process – not just a claim's place of service designation.

The site of service screen used for 49521 inaccurately portrays these patients as typically ambulatory and leaving a facility on the same date of service. OPPS data for this code includes claims where patients were admitted and discharged on different dates. The current RUC survey indicates that the typical patient is admitted or kept overnight and that an E/M visit is performed on the day of the procedure. An expert panel of general surgeons representing all geographic practice settings and all types of practices have reviewed the survey data for this code and believe that the clinical rationale discussed above justifies admitting a majority of these patients. **We recommend maintaining the current work RVU of 12.36. We also recommend the survey median time and visits which include E/M work on the day of the procedure and 1 x 99238 for the discharge work provided the next day, if the patient can safely be released from the hospital.**

With respect to the E/M work on the day of the procedure, we believe the typical service is equivalent to 99231 because the typical patient is admitted to the surgical ward by the surgeon's orders and until the patient is discharged, the work being performed is inpatient. However, if semantics require use of different codes, then we might suggest using the followi two codes as proxies: 99218 *Observation care* for work on the day of the procedure and 99217 *Observation care dischar* for work the following day. The use of these proxies will require a change to the SoR and the RUC database because these codes are not currently identified. However, we do not suggest adding these codes – which would only be proxies for work – to the RUC survey.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:49587 Tracking Number Specialty Society Recommended RVU: **7.96**

Global Period: 090 RUC Recommended RVU: **7.96**

CPT Descriptor: Repair umbilical hernia, age 5 years or over; incarcerated or strangulated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old obese male presents with 3 hour history of painful swelling in the umbilical region. Physical exam reveals an umbilical hernia that is tender and nonreducible by manual manipulation. He undergoes operative reduction and repair.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 30% , Kept overnight (less than 24 hours) 42% , Admitted (more than 24 hours) 29%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 77%

s moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Assess need for beta-blockers, order as required. Review preadmission work-up, with particular attention to imaging information and reports. Reexamine patient to make sure that physical findings have not changed, that the hernia remains unreducible, and update H&P. Review results of preadmission testing (lab, EKG, chest x-ray, availability of blood products). Meet with patient and family to review planned procedure and post-operative management.. Review and obtain informed consent, including the possiblity of bowel resection, with witness. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available Assist in transfer of patient from gurney to operating table. Monitor/assist with positioning of patient. Install or supervise installation of Foley catheter Assist anesthesia team with line placement and induction of anesthesia and intubation. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Incision is made through skin and subcutaneous tissue taking care not to injure the derlying bowel that is incarcerated. Dissection carried out meticulously around the hernia sac to expose the fascial g. The neck of the hernia sac is then released to allow pressure on the hernia sac contents to be lessened. The hernia sac is opened to facilitate examination of the incarcerated contents. The viability of the bowel is assessed. If bowel resection is indicated, it is performed (reported separately). If no resection is required, the bowel is reduced into the abdomen and the degree of ischemia is assessed to determine ability to place mesh and the potential risk for infection. Once the bowel is reduced, the peritoneum of the hernia sac is circumferentially dissected, resected if there is excess and

oversewn. The fascial defect is closed either primarily or with added implantation of mesh (reported separately) as determined by the size of the defect and the quality of the fascia. Hemostasis is obtained. The wound is irrigated. The subcutaneous tissue is reapproximated and the skin is closed. Sponge, needle, and instrument counts are obtained and confirmed prior to closure.

Description of Post-Service Work: Hospital: Apply sterile adhesive strips and dressings. Monitor patient during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough on emergence from anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discontinue prophylactic antibiotic therapy as appropriate. Instruct nursing staff in care of tubes and other devices. Review post-operative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to general surgical floor and discuss ongoing care with floor nurses. Examine patient, including reviewing vital signs and confirming as necessary. Auscultate heart, lungs, and abdomen for bowel sounds. Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection. Continue prophylaxis for DVT. Monitor daily for adequacy. Assess need for beta-blockers, order as required. Monitor and document patient progress. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status and renal function. Review nursing/other staff patient chart notes. Write orders for labs, films, medications, diet, and patient activity. Chart patient progress notes, daily. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (i.e., diet, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is return of bowel function, taking adequate nutrition, and adequate pain control with oral analgesics. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

At follow-up office visits: Examine and talk with patient. Remove staples or sutures, when appropriate. Review activity and restrictions. Monitor healing of incision with appropriate physical examination, including dealing w questions of patient and family. Check for presence of post-operative hematoma/seroma and assess need for aspiration. Arrange to return for review if necessary. Monitor diet caloric intake by weight. Answer patient/family questions. Write medication prescriptions. Post discharge labs/films are ordered and reviewed. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart. Review activity permission with patient and write appropriate permission.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Coding changes were made to the family of hernia codes for CPT 1994 to differentiate physician work. A request was made to separate incarcerated and strangulated hernias, but the CPT Editorial Panel chose to combine those procedures. The RUC process in 1993 utilized consistent ratios for valuing reducible, incarcerated/strangulated, initial, and recurrent for each type of hernia, with a goal of maintaining budget neutrality across all hernia codes. In 2000, during the 2nd 5 year review, the hernia codes were surveyed as minisurveys (except for 49505) and the work RVUs adjusted using the

percentage change made to 49505, which underwent a full RUC survey. Many of the more difficult procedures had evidence to support higher values, but the details of the mini-surveys were not reviewed on a code-by-code basis.

For code 49587, the 2006 Medicare claims data in the RUC database indicate 37% inpatient hospital and 56% outpatient hospital. The 2007 Medicare claims data show a slight change to 36% inpatient and 56% outpatient, along with a 5% decrease in total frequency. Our current survey indicates a majority of the patients are kept overnight. For the respondents that indicated an overnight stay, a majority indicated an E/M service would be performed on the same day (77%).

The survey data show - and our expert consensus panel concurs - that a majority of these patients require close monitoring on the day of the procedure and are kept in the hospital for continued monitoring for problems such as ileus, ischemia, and urinary retention. Additionally, there will be severe pain post-operatively requiring management before discharge. After considering relevant data, options, and risks on the day following surgery, the surgeon will make the decision for the patient to stay in the hospital or to be discharged. The patient will not be discharged until there is return of bowel function, the patient is taking adequate nutrition, and there is adequate pain control with oral analgesics. Clearly, if on the day of surgery, the surgeon's orders are to admit the patient, follow-up hospital E/M visit(s) that occur should be considered part of the typical global work. This is independent of whether the post-discharge "billing status" for a patient changes from admit to outpatient the next day because the patient is discharged "within" 24 hours.

We believe that semantics about place of service and length of stay have created an undo concern with regard to screening, reviewing and accounting for physician work. Medicare representatives have stated that a claim designated as "outpatient" is a hospital stay of 23hr-59min or less. On the other hand, CPT codes describe E/M codes in a less concrete fashion. For example, codes 99201-99205 and 99211-99215 describe E/M services provided in the physician's office or in an outpatient or other ambulatory facility. These place of service designations are not consistent with patients staying overnight or longer on a hospital surgical ward. We would argue that a hospital surgical ward is not "ambulatory." Further, CPT indicates that codes 99234-99236 are to be used to report observation or inpatient hospital care services provided to patients admitted and discharged on the same date of service. For these codes, claims can correctly be submitted as inpatient same day service and in 2006, Medicare claims data show more than 50% inpatient claims for 99234. Clearly, 50%+ of these 71,000+ patients were not admitted at 12:00am and discharged at midnight – which according to Medicare is the only way that a claim can be considered inpatient.

All of the discussion above is meant to emphasize that reason needs to prevail in the discussion about accounting for physician work for patients who are not ambulatory and do not leave a hospital outpatient surgery center on the day of a procedure, but instead are admitted to the surgical ward. A claim's place of service designation does not relate to or accurately describe physician work. If 50% of claims for same day E/M work can have a place of service designation as inpatient, then some percentage of claims with a place of service designation of outpatient can be patients staying overnight (or longer). Discussion of clinical rationale and professional judgment is important to the review process – not just a claim's place of service designation.

The site of service screen used for 49587 inaccurately portrays these patients as typically ambulatory and leaving a facility on the same date of service. OPPS data for this code includes claims where patients were admitted and discharged on different dates. The current RUC survey indicates that the typical patient is admitted or kept overnight and that an E/M visit is performed on the day of the procedure. An expert panel of general surgeons representing all geographic practice settings and all types of practices have reviewed the survey data for this code and believe that the clinical rationale discussed above justifies admitting a majority of these patients. **We recommend maintaining the current work RVU of 7.96. We also recommend the survey median time and visits which include E/M work on the day of the procedure and 1 x 99238 for the discharge work provided the next day, if the patient can safely be released from the hospital.**

With respect to the E/M work on the day of the procedure, we believe the typical service is equivalent to 99231 because the typical patient is admitted to the surgical ward by the surgeon's orders and until the patient is discharged, the work being performed is inpatient. However, if semantics require use of different codes, then we might suggest using the following two codes as proxies: 99218 *Observation care* for work on the day of the procedure and 99217 *Observation care discharge* for work the following day. The use of these proxies will require a change to the SoR and the RUC database because these codes are not currently identified. However, we do not suggest adding these codes – which would only be proxies for work – to the RUC survey.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
February 2009

Cryoablation of Prostate

In June 2008, CMS requested the RUC to review non-facility setting direct practice expense recommendations for CPT Code 55873 *Cryosurgical ablation of the prostate (includes ultrasonic guidance for interstitial cryosurgical probe placement).* The American Urological Association's Quality Improvement and Patient Safety Committee maintained that 55873 may be performed in the office setting assuming that a Class C surgical facility designation for anesthesia has been achieved. The RUC reviewed the direct practice expense recommendation in the non-facility setting as presented by the specialty and realized the service was initially reviewed as a new code by the RUC in February 2001. RUC members believed that the intra-service physician time since the RUC' initial review had declined (from 200 minutes) as the service is now more often performed. The RUC agreed with the specialty that the service should be surveyed for physician work for presentation with revised direct practice expense input information at the RUC's January 29 – February 1, 2009 meeting.

1834

At the RUC's January 29 – February 1, 2009 meeting the specialty society provided a clear description of the service being provided. The survey respondents had chosen CPT code 55875 *Transperineal placement of needles or catheters into prostate for interstitial radioelement application, with or without cystoscopy* (Work RVU = 13.31) as its key reference service. RUC members had expressed their concern regarding the high intra-service work per unit of time (IWPUT) and the change in intra-service time from the previous survey performed eight years prior. The specialty explained that the performance of the procedure has changed and the intensity had increased. The monitoring of multiple body data points for temperature change simultaneously, the placement of multiple probes, and the reduction of time of obtaining and maintaining a -40F ice ball formation, has increased the intensity and reduced the intra-service time. In addition, it was explained that the risk of patient injury during the entire procedure is quite high.

The RUC agreed that the work value for code 55873 is similar to the specialty's key reference service 55875. However, the RUC did not agree with the specialty's recommended value of 15.50. The RUC reviewed its previous recommendation from February 2001 which was established through a building block methodology with an intra-service work per unit of time (IWPUT) of 0.071. RUC members understood that from the recent survey the intra-service time is lower (100 rather than 200 minutes) and a higher intensity and complexity has been recognized than when the code was first surveyed. Due to a more complex and intense monitoring of the organs and ablated area, RUC members concurred that the intensity of 55873 is between the specialty survey's key reference service code 55873 (IWPUT = 0.0948) and its originally determined intensity of 0.071 established from CPT code 55845 *Prostatectomy, retropubic radical, with or without nerve sparing; with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and*

obturator nodes (Work RVU = 30.52). The RUC agreed the IWPUT to be approximately 0.083 which is precisely between the IWPUT of 55845 and 55873. Using the specialty's surveyed physician time components and an IWPUT of 0.083 the RUC constructed a building block methodology that resulted in a work relative value of **13.45** for CPT code 55873.

The RUC agreed that an anchor code and a building block approach would also be useful at establishing the correct value. The RUC considered several similar services with a range of complexities including code 50593 *Ablation, renal tumor(s), unilateral, percutaneous, cryotherapy* (Work RVU = 9.08, IWPUT = 0.064). Code 50593 has 90 minutes of intra-service time, however the ultrasound guidance needed to place the needles is coded separately, and the insertion of a superpubic catheter is required for cryoablation of the prostate. Adding up these components was agreed be appropriate in establishing the physician work value for code 55873. The RUC agreed that although the physician work for code 55873 is similar to code 50593, it is more intense and concurred the intensity of 0.083 needed to be maintained.

The RUC then took 90 minutes of intra-service work time out of code 50593 at an IWPUT of 0.064 (0.064 X 90 = 5.76) and replaced with 90 minutes of work at an IWPUT of 0.083 (0.083 X 90 = 7.47) to arrive at a beginning value of 10.79. (7.47 – 5.76 = 1.71 RVUs + 9.08 = 10.79). The insertion of a superpubic catheter and the ultrasound guidance are then added to arrive at a value similar to 13.45 as shown below.

1835

This building block utilizes the work the following three codes:
50593 *Ablation, renal tumor(s), unilateral, percutaneous, cryotherapy* (Work RVU = 9.08 +1.71 (intensity RVU difference) = 10.79.
51102 *Aspiration of bladder; with insertion of suprapubic catheter* (Work RVU = 2.70 X 50% (multiple procedure reduction) = 1.35)
76965 *Ultrasonic guidance for interstitial radioelement application* (Work RVU = 1.34)

10.79
+1.35
+1.34
13.48

The RUC's building block and IWPUT methodologies led them approximately to the same physician work value of 13.45 RVUs. The RUC also reviewed and compared the work of codes 49565 *Repair recurrent incisional or ventral hernia; reducible* (Work RVU = 12.29, 100 minutes intra-service time), 58550 *Laparoscopy, surgical, with vaginal hysterectomy, for uterus 250 g or less;* (Work RVU = 14.97, 100 minutes intra-service time), and 29806 *Arthroscopy, shoulder, surgical; capsulorrhaphy* (Work RVU = 14.95, 100 minutes intra-service time). After developing a building block methodology, reviewing similar procedures with 100 minutes of intra-service time and intensity ranges, **the RUC recommends a relative work value of 13.45 for CPT code 55873.** This value preserves the rank order between 55873 and its key reference code 55875.

Practice Expense: The RUC reviewed the direct practice expense inputs as recommended by the specialty and made some minor edits to the clinical labor and medical supplies to reflect the typical patient service.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
55873	Cryosurgical ablation of the prostate (includes ultrasonic guidance and monitoring	090	13.45

1836

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:55873 Tracking Number Specialty Society Recommended RVU: **15.50**

Global Period: 090 RUC Recommended RVU: **13.45**

CPT Descriptor: Cryosurgical ablation of the prostate (includes ultrasonic guidance and monitoring)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62 year-old man with clinically localized prostate cancer, having considered all available treatment options, has elected to have cryosurgical ablation of the prostate. NOTE: Placement of a suprapubic tube (trocar technique) is included in the work of this procedure. All postoperative care for 90 days is included.

Percentage of Survey Respondents who found Vignette to be Typical: 62%

Percent of survey respondents who stated they perform the procedure; In the hospital 92% , In the ASC 8%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 56% , Kept overnight (less than 24 hours) 38% , Admitted (more than 24 hours) 6%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 46%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 22%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 5%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Appropiate preoperative studies are obtained and reviewed. The patient is seen by the operating surgeon before being given an anesthetic. Procedure specific equipment is checked. The patient is taken to the operating room and given either general or spinal anesthesia, appropiately positioned for the procedure, prepped and draped.

Description of Intra-Service Work: The patient is in the dorsal lithotomy position. A cystoscopy is performed. The skin of the perineum and suprapubic area is prepped and draped and the bladder palpated. The bladder is filled in a retrograde fashion using a syring or catheter. A trocar puncture is made into the bladder. A guidewire is introduced into the bladder through the sheath once the trocar itself is removed. A skin incision is made to facilitate catheter advancement over the guidewire. A suprapubic tube is placed. This accomplished, the guidewire is removed, the balloon inflated, return checked through the catheter port, and the catheter sutured to the skin. A guidewire is then placed into the bladder through the urethra and a urethral warming device is advanced into the bladder over the guidewire. The guidewire is then removed. The transrectal ultrasound probe is positioned in the rectum. Multiple needle passes are made into the prostate through the perineum. The stylet of each needle is removed and an angle tipp wire advanced through the needle into the prostate. The needle sheath is then removed. The process is repeat multiple times until all needles have been replaced with angle tipped wires. A small incision is made on the perineum where each guidewire enters the skin to facilitate passage of a series of sequential dilators. Using these dilators, a tract is made through the perineum and pelvic floor into the prostate. Finally, multiple cryosurgical probes are placed over the guidewires and into the prostate under ultrasonic guidance. The cryoprobes are cooled to the appropriate setting.

The initial freeze takes approximately 15 minutes followed by 15 minutes of thaw time. The second freeze time is approximately 15 minutes followed by 15 minutes of thaw time. The iceball's growth and regression is monitored with ultrasound. A second freeze is routinely done. A third freeze may be done in the area of the urethral diaphragm and prostatic apex by withdrawing the posterior probes. After all areas are treated, the cryoprobes are thawed and removed. The cryoprobe sheath sites in the perineum may be closed with sutures. A compression dressing applied.

Description of Post-Service Work: The surgeon waits in the operating room and assists the anesthesiologist in transferring the patient to a recovery room stretcher. The patient is transferred to the recovery room. Post-operative orders are written. A detailed operative report is dictated. The surgeon talks with the patients family about the procedure, diagnosis and post operative care. The patient is either admitted to the hospital or dismissed home later that day after being assessed by the surgeon. Hospital by-laws require that a detailed dishcarge summary must be dictated. All postoperative care for 90 days is included.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 55873

low often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
if the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 6000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Information was provided by industry.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
010 or 090 Day Global Periods
Non Facility/Facility Direct Inputs

CPT Long Descriptor: Cryosurgical ablation of the prostate (includes ultrasonic guidance and monitoring)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The recommendations were developed by a Panel consisting of five physicians who represent urological practices from across the United States in single specialty groups in suburban and urban settings. They represent the states of Washington, Illinois, Virginia, Wisconsin, and New York. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

Please describe the clinical activities of your staff:
Pre-Service Clinical Labor Activities:
Pre-service screening
Test and examination results
Informed consent
Assure proper authorization/referral/precertification
Organize all necessary personnel for procedure
Organize all necessary personnel and services for the intra-service period
Answer questions from patient and family (face to face and telephone)
Day of Procedure
Review charts
Greet patient and provide gowning
Obtain vital signs
Provide pre-service education and obtain consent
Prepare room, equipment, supplies
Prepare and position patient/monitor patient/set up IV

Intra-Service Clinical Labor Activities:

Staff 1 - Assist MD in performing procedure (100%)
Test cryo probe
Prepares patient
Assist physician with cystoscopy procedure and suprapubic tube placement
Assist physician with foley catheter placement
Hands cryo probe to physician for placement
Monitors patient during freeze and thaw process

Staff 2 – Assist MD in performing procedure (75%)
Bring machine into room and put in position for procedure
Test cryo probe
Set up ultrasound machine and assist physician with ultrasound
Assist in treatment planning

Assist physician with probe placement according to treatment plan
Monitor ultrasound for probe placement
Determine number of probes to be placed with physician
Operate thermal machine and set levels for freezing
Monitor freezing and thawing of iceball in prostate

Post-Service Clinical Labor Activities:
Monitor patient following service/check tubes, monitors, drains
Clean room/equipment by physician staff
Examination of perineum and suprapubic area
Cleaning wound and apply new dressing
Help patient dress
Patient education
Calling in prescription
Preparing and cleaning room
Sterilizing instruments

Summary of Recommendations

February 2009

Hysteroscopy

At the request from the Centers for Medicare and Medicaid Services, the RUC reviewed a list of direct practice expense input changes specific to the following CPT codes:
58555 *Hysteroscopy, diagnostic (separate procedure)*
58558 *Hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D & C*
58562 *Hysteroscopy, surgical; with removal of impacted foreign body*
58563 *Hysteroscopy, surgical; with endometrial ablation (eg, endometrial resection, electrosurgical ablation, thermoablation)*

The specialty society noticed that some practice expense items for the typical service, needed to be included. The RUC reviewed these practice expense additions carefully and agreed with the specialty's recommendations. They agreed that a pack for cleaning surgical instruments, already included in the practice expense items for these services, is necessary in addition to the pack for cleaning and disinfecting the endoscope because the hysteroscopy services need a speculum, a tenaculum, and other sterile equipment to access the uterus, in addition to the endoscopy instruments. The cystoscopy pack is required for installation of the distention fluid and is in addition to the exam pack that is now recommended. **The RUC recommends the following additions and deletions to the direct practice expense inputs:**

1. **58555**- *Hysteroscopy, diagnostic (separate procedure)*
    a. SA058- Pack, Urology cystology visit
    b. SA042-Pack, Cleaning and disinfecting, endoscope
    c. SB001-Cap, Surgical
    d. SB027-Gown, Staff, impervious
    e. SB034-Mask Surgical, with face shield
    f. SB039-Shoe Cover, Surgical
    g. SJ036- Monsel's Soln
    h. SC053- Syringe, 20 ml
    i. **Remove Items:** (SB024-Gloves- sterile, SJ041-Povidone Soln Betadine, SC062 Toomey syringe)

2. **58558**- *Hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D & C*
    a. SA058- Pack, Urology cystology visit
    b. SA042-Pack, Cleaning and disinfecting, endoscope
    c. SB001-Cap, Surgical
    d. SB027-Gown, Staff, impervious
    e. SB034-Mask Surgical, with face shield
    f. SB039-Shoe Cover, Surgical
    g. SJ036- Monsel's Soln
    h. SC053- Syringe, 20 ml
    i. **Remove Items:** (SB024 Gloves-sterile, SJ041-Providone Soln Betadine, SC062 Toomey syringe)

3. **58562**- *Hysteroscopy, surgical; with removal of impacted foreign bo*dy
    a. SA058- Pack, Urology cystology visit
    b. SA042-Pack, Cleaning and disinfecting, endoscope
    c. SB001-Cap, Surgical
    d. SB027-Gown, Staff, impervious
    e. SB034-Mask Surgical, with face shield
    f. SB039-Shoe Cover, Surgical
    g. SJ036- Monsel's Soln
    h. SC053- Syringe, 20 ml
    i. **Remove Items:** (SB024 Gloves-sterile, SJ041-Providone Soln Betadine, SC062 Toomey syringe)

4. **58563**- *Hysteroscopy, surgical; with endometrial ablation (eg, endometrial resection, electrosurgical ablation, thermoablation)*
    a. SA058- Pack, Urology cystology visit
    b. SA042-Pack, Cleaning and disinfecting, endoscope
    c. **Remove Items:** (SM018 Glutaraldehyde 3.4% Cidex, Maxicide, Wavicide, SH048-Lidocaine 2% jelly, topical (Xylocaine), SH069- Sodium chloride 0.9% irrigation (500-1000ml), SD129 Tubing, irrigation(Cysto), SD118 (-1) vaginal specula)

February 2009

Obstetric Procedures

The Five Year Review Identification Workgroup identified the following codes as potentially misvalued through the High IWPUT Screen and the RUC recommended that they be surveyed: 59400, 59409, 59410, 59412, 59414, 59425, 59426, 59430, 59510, 59515, 59610, 59612, 59614, 59618, 59620, and 59622. The RUC referred development of an MMM survey instrument to the Research Subcommittee with input from the specialty society at its October 2008 meeting. The Research Subcommittee has worked with the specialty since that time to develop a survey method to review these codes. The survey and process was finalized at the April 2009 RUC meeting. Data will be collected and presented at the October 2009 RUC meeting.

1860

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
59400	Routine obstetric care including antepartum care, vaginal delivery (with or without episiotomy, and/or forceps) and postpartum care	MMM	Defer to October 2009
59409	Vaginal delivery only (with or without episiotomy and/or forceps);	MMM	Defer to October 2009
59410	including postpartum care	MMM	Defer to October 2009
59412	External cephalic version, with or without tocolysis	MMM	Defer to October 2009
59414	Delivery of placenta (separate procedure)	MMM	Defer to October 2009
59425	Antepartum care only; 4-6 visits	MMM	Defer to October 2009
59426	7 or more visits	MMM	Defer to October 2009

Cranial Neurostimulators

CPT codes 61885 *Insertion or replacement of cranial neurostimulator pulse generator or receiver, direct or inductive coupling; with connection to a single electrode array*, and 64573 *Incision for implantation of neurostimulator electrodes; cranial nerve* were identified by the Five-Year Review Identification Workgroup as potentially misvalued through its Site of Service Anomaly screen in September 2007. The Workgroup reviewed all services that include inpatient hospital visits within their global periods, but are performed less than 50% of the time in the inpatient setting, according to recent Medicare utilization data. The RUC originally recommended a two-step action. First, the RUC removed the hospital visits from the service with no impact on the associated work RVU, which CMS agreed with. Second, the RUC recommended that services be surveyed. At the April 2008 RUC Meeting, the specialty societies presented data that indicate that although these procedures are reported as outpatient procedures more than 50% of the time, patients typically spend at least one night in the hospital. The RUC deferred action on these issues until an adequate survey instrument was developed. The RUC approved a revised survey instrument in October 2008.

The specialty societies presented information to the RUC that as a result of recent developments in the use of vagal nerve stimulators, there are some concerns about the use of 61885 and 64573 with respect to these procedures. The specialty societies are bringing forth a CPT coding proposal to revise 61885 and 64573 to better describe revision of a vagal nerve stimulator lead and the placement of the pulse generator and replacement or revision of the vagus nerve electrode. The specialties requested that the RUC review of CPT codes 61885 and 64573 be postponed until a revision of the descriptors for these codes has been reviewed by the CPT Editorial Panel.

The RUC agreed with the specialty societies and recommended referral of 61885 and 64573 to the CPT Editorial Panel.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
61885	Insertion or replacement of cranial neurostimulator pulse generator or receiver, direct or inductive coupling; with connection to a single electrode array	090	Referral to the CPT

April 2009

Fluoroscopy – Practice Expense Recommendation

The Physician Consortium for Performance Improvement (PCPI) is developing a measure related to the use of fluoroscopy. The PCPI reviewed all services where fluoroscopy was included in the practice expense direct inputs to determine the denominator codes. The American College of Radiology suggested that seven services may not typically be performed with fluoroscopy. CMS requested that the RUC consider deleting these expenses from the inputs for these seven services. Other specialties were provided with the opportunity to review the issue and determine what room is typically used in providing the service. The RUC reviewed each service and concurred with the specialty societies that codes 64520, 64622, and 64626 provide fluoroscopy and require a radiographic-fluoroscopic room.

1864

The RUC determined that code 64510 is performed in a examination room and services 76100 - 76102 are performed in an X-ray room. **The RUC recommends that the equipment item EL014 Room, radiographic-fluoroscopic is appropriate for 64520, 64622, and 64626 and will notify PCPI staff. The RUC also recommends the replacement of equipment item EL014 Room, radiographic-fluoroscopic to an exam table (EF023) for 64510 and a Basic Radiology Room (EL012)for CPT codes 76100, 76101, and 76102.**

CPT Code	CPT Descriptor	Global Period	Practice Expense Only Recommendation
64510	Injection, anesthetic agent; stellate ganglion (cervical sympathetic)	000	PE Recommendation only to change fluoroscopic room (EL014) to exam table (EF023)
64520	Injection, anesthetic agent; lumbar or thoracic (paravertebral sympathetic)	000	(No Change – will inform PCPI staff that fluoroscopy is typically used)

CPT Code	CPT Descriptor	Global Period	Practice Expense Only Recommendation
64622	Destruction by neurolytic agent, paravertebral facet joint nerve; lumbar or sacral, single level (For bilateral procedure, report 64622 with modifier 50)	010	(No Change – will inform PCPI staff that fluoroscopy is typically used)
64626	Destruction by neurolytic agent, paravertebral facet joint nerve; cervical or thoracic, single level (For bilateral procedure, report 64626 with modifier 50)	010	(No Change – will inform PCPI staff that fluoroscopy is typically used)
76100	Radiologic examination, single plane body section (eg, tomography), other than with urography	XXX	(No Change – PE Recommendation only to change fluoroscopic room (EL014) to a Basic Radiology Room (EL012))
76101	Radiologic examination, complex motion (ie, hypercycloidal) body section (eg, mastoid polytomography), other than with urography; unilateral	XXX	(No Change – PE Recommendation only to change fluoroscopic room (EL014) to a Basic Radiology Room (EL012))
76102	bilateral (For nephrotomography, use 74415)	XXX	(No Change – PE Recommendation only to change fluoroscopic room (EL014) to a Basic Radiology Room (EL012))

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from Five-Year Review

April 2009

Biopsy of Ear

The RUC identified 69100, *Biopsy external ear*, as potentially misvalued based on the recommendation of the Five Year Review Identification Workgroup. The code was referred to the Workgroup for review via the CMS Fastest Growing Screen. The RUC recommended that 69100 be surveyed for April 2009.

The specialty society indicated that it would pursue deletion of 69100 from CPT, as the work commonly reported under this code can be reported more efficiently by using 11100, *Biopsy of skin, subcutaneous tissue and/or mucous membrane (including simple closure), unless otherwise listed; single lesion* (work RVU = 0.81). The specialty societies were unable to complete their coding change application in time for CPT 2010, and 69100 will appear in the CPT book until CPT 2011. Subsequently, the specialty surveyed the procedure to develop an appropriate work RVU until the service is deleted from CPT. In its comments regarding deletion of 69100 and migration to use of 11100, the specialty noted that the practice expense RVU associated with 11100 is slightly lower that that of 69100. Further, the specialty noted that 69100 may be reported multiple times within the same visit on the same patient, whereas 11100 should be reported only once.

The specialty presented the results from a survey of 38 dermatologists. The surveyees indicated a median work RVU of 0.92, which is slightly higher than the current work RVU of 0.81, which was developed during the Harvard survey process and validated by the RUC during the first Five-Year Review without a survey. The specialty society expert panel reviewed the survey physician time and made minor changes to the intra-service time, reducing it by one minute to twelve minutes. The survey respondents indicated a median pre-service time of 7 minutes, which the specialty society expert panel agreed with. Survey respondents identified key reference service 11100, which is similar and often identical to the surveyed code. Because of the specialized location of the biopsy, the specialty society expert panel agreed with the survey respondents that an additional two minutes of pre-service time is required. However, the expert panel did not agree that there should be any difference in the work RVU. The RUC agreed with the specialty society presenters that the work of 69100 is identical to 11100 and should be valued the same. **Therefore, the RUC approved the amended physician time of 7 minutes pre-service evaluation, 12 minutes intra-service, and 5 minutes immediate post-service time and a physician work RVU of 0.81 for CPT code 69100, until it is deleted from CPT.**

Five-Year Review Identification Workgroup

RE: Code Assignment for 69100

Dear Dr. Rich, and Dr. Levy
The American Academy of Dermatology (AAD) respectfully submits the following comments and data in response to the Five Year Review Identification Work Group's Assignment of CPT 69100 for the April 09 AMA RUC Meeting. As required, AAD has surveyed this code and submits the attached Summary of Recommendation (SoR) form summarizing that data.

This code was identified because it is a procedure with increased utilization that has never been surveyed by the RUC. The RUC 5YR ID Workgroup accepted the AAD work plan to survey the code in preparation for the April 09 RUC meeting. AAD requested and received CMS data on the frequency of biopsy and site specific biopsies performed at the same time as an E&M service. The Workgroup asked that we provide data regarding evaluation and management on the same date. This data is included in the SoR.

The American Academy of Dermatology conducted a random survey among its members and the results reviewed and analyzed by our RB/RVS Work Group. Although some of the survey respondents indicated a measurable difference in time and difficulty for CPT 69100, the majority of respondents consistently ranked it as essentially equal to the reference code, CPT 11100 skin biopsy. The proposed recommended values are the 25th percentile for intra time of 12 min and PW/RVU value of 0.87 RVUs.

Survey findings suggest that CPT 69100 should be considered redundant to 11100, a position maintained by our work group and an action plan which should have been pursued. Dermatology currently has +90% utilization of this code. Deletion of this code would result in annual savings to Medicare in the difference in Medicare Fee Schedule payment for 69100 vs 11100. This current difference is probably accounted for in minor PE differences between the 2 codes. If accepted, deletion of 69100 would result in current annual Medicare utilization for this code shifting to CPT 11100.

We have requested comment from otolaryngology regarding revising or deleting this code, but to date, have not received their definitive feedback, but in emails have been told it was most likely acceptable to them to delete this code.

If you have questions regarding this submission, please contact Norma L. Border at 847 240 1814 or nborder@aad.org.

Sincerely,

Brett Coldiron MD

Brett Coldiron, M.D., FAAD, FACP

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69100 Tracking Number Specialty Society Recommended RVU: **0.81**

Global Period: 000 RUC Recommended RVU: **0.81**

CPT Descriptor: Biopsy external ear

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48 year old woman with extensive actinic damage presents with a 6mm scaly erythematous nodule on the inner helix of the R ear. The differential involves an invasive squamous cell carcinoma, a basal cell carcinoma and chondrodermatitis nodularis helicis.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 100%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Prior to biopsy of lesion, obtain pertinent history from patient to include: previous skin cancer, prior treatment history, sun protection history, etc. Discussion with patient will include: indication for biopsy procedure, risks, and benefits; description of biopsy procedure method, and expected result and/or scarring. In addition, patient agreement/informed consent is obtained and staff is advised for preparation of patient and necessary anesthetic, supplies, and instrument tray preparation.

Description of Intra-Service Work: inspection and palpation of the lesion to assess depth and to select most representative site to obtain specimen. Cleanse biopsy site with suitable antiseptic; inject appropriate local anesthetic; apply sterile drapes; obtain skin specimen with scalpel, skin punch, or suitable instrument depending on depth and amount of tissue needed. Collect specimen in labeled formalin container. Undermine wound edges as needed to facilitate repair. Suture to approximate wound edges, or achieve hemostasis with pressure, chemical, or electrocautery, or application of topical hemostatic agents. Apply antibiotic ointment and sterile dressing.

Description of Post-Service Work: instruction of patient and/or family on postoperative wound care, dressing chang and follow-up. Patient advised how to recognize significant complications, eg, bleeding, or allergic reaction to antibio ointment or adhesive dressings. Patient advised when results will be available and how they will be communicated; completion of medical record; and communication of results to referring physician as appropriate.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an RVPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code was identified because it is a procedure with increased utilization that has never been surveyed by the RUC. The RUC 5YR ID Workgroup accepted the AAD work plan to survey the code in preparation for the April 09 RUC meeting. AAD requested and received CMS data on the frequency of biopsy and site specific biopsies performed at the

same time as an E&M service. The Workgroup asked that we provide data regarding evaluation and management on the same date. This data is included in the SoR.

The American Academy of Dermatology conducted a random survey among its members and the results reviewed and analyzed by our RB/RVS Work Group. Although some of the survey respondents indicated a measurable difference in tir and difficulty for CPT 69100, the majority of respondents consistently ranked it as essentially equal to the reference code, CPT 11100 skin biopsy. The proposed recommended values are the 25th percentile for intra time of 12 min and PW/RVU value of 0.87 RVUs.

Survey findings suggest that CPT 69100 should be considered redundant to 11100, a position maintained by our work group and an action plan which should have been pursued. Dermatology currently has +90% utilization of this code. Deletion of this code would result in annual savings to Medicare in the difference in Medicare Fee Schedule payment for 69100 vs 11100. This current difference is probably accounted for in minor PE differences between the 2 codes. If accepted, deletion of 69100 would result in current annual Medicare utilization for this code shifting to CPT 11100.

We have requested comment from otolaryngology regarding revising or deleting this code, but to date, have not received their definitive feedback, but in emails have been told it was most likely acceptable to them to delete this code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Reported with E&M visit 43%

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69100

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatolgy How often? Commonly

Specialty Otolaryngology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 125000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Utilization suggests Medicare population has 66% incidence.

Specialty Dermatology Frequency 113200 Percentage 90.56 %

Specialty Otolaryngology Frequency 3750 Percentage 3.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 82,587 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on Medicare utilization data.

Specialty Dermatology Frequency 74791 Percentage 90.56 %

Specialty Otolaryngology Frequency 2478 Percentage 3.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

ıdicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from Five-Year Review

April 2009

Soft Tissue Ultrasound

The RUC identified 76536, *Ultrasound, soft tissues of head and neck (eg, thyroid, parathyroid, parotid), real time with image documentation*, as potentially misvalued based on the recommendation of the Five Year Review Identification Workgroup. The code was referred to the Workgroup for review via the CMS Fastest Growing Screen. The RUC recommended that 76536 be surveyed.

The specialty society presented evidence that the work for 76536 has changed since it was first valued. The specialty noted that the typical patient has changed due to the increasing incidence and prevalence of thyroid cancer. The specialty commented that the increased incidence of thyroid cancer results in a more complex patient. However, the RUC did not agree that a rise in the recognition of certain types of cancer necessarily increases the intensity or complexity of the existing mechanisms for diagnosis of the condition. The specialty next presented evidence that the improvement in technology, including color flow and power Doppler evaluation as well as increased transducer resolution increases the complexity of the examination and the expectations of the patient. The RUC commented that the improvement in technology may increase the information available to review, but that it concurrently improves the test's accuracy and readability, affording the practitioner a more reliable and revealing test result. Lastly, the specialty noted that the code had never been reviewed by the RUC and that the original data used to value to the service may not have included the current practitioners of the service. The RUC noted that lack of RUC review is not compelling evidence to consider an increase in the RVU under the RUC rules defining the review of services identified in the Five-Year Review Process and that there is no evidence that the CMS valuation of 76536 was either inclusive or not inclusive of radiologists and endocrinologists that provide this service. Therefore, the RUC did not agree that the compelling evidence standards, required to recommend a work RVU higher than the current value, for 76536 had been met.

The specialty society presenters provided evidence that the value of 76536 should not be reduced beyond its current work RVU of 0.56. The presenters provided the survey results of 63 radiologists and endocrinologists. The median work RVU identified by the surveyees was 1.00 and the 25th percentile work RVU was 0.74. The presenters noted that the existing total physician time within the RUC database is 18 minutes, which is not allocated between pre-service, intra-service, or post-service time. The survey respondents indicated that the existing physician time is somewhat under-representative and indicated times of 5 minutes pre-service, 15 minutes

intra-service and 5 minutes post-service time. However, the RUC queried and received the independent survey data of radiology vs. endocrinology. Radiologists indicated a lower intra-service time of 10 minutes, compared to 20 minutes for endocrinology.

Radiologist surveyees indicated a key reference service of 76776, *Ultrasound, transplanted kidney, real time and duplex Doppler with image documentation* (work RVU = 0.76, pre-service = 5 minutes, intra-service = 15 minutes, post-service = 5 minutes). The specialty society expert panel indicated that the appropriate physician time for 76536 should be less than 76776 as the reference service is valued slightly higher. Therefore, the specialty recommended physician times of 4 minutes pre-service, 10 minutes intra-service, and 4 minutes post-service. The RUC agreed that the work of 76776 is slightly greater than that of 76536, which justifies the difference in physician time. Further, the RUC agreed that given the survey results, the work RVU of 76536 should not be lower than its current value of 0.56 and that the current value appropriately ranks the service within its family. In further support of this recommendation, the RUC reviewed 99212, *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A problem focused history; A problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family,*(work RVU = 0.45, pre-service = 2, intra-service = 10, post-service = 4). The RUC agreed that the two services are very similar and that the current work RVU for 76536 of 0.56 appropriately accounts for the additional pre-service time and slightly greater intensity. **Therefore, the RUC recommends that the current work RVU for 76536 be maintained at 0.56 and that the physician time be changes to 4 minutes pre-service evaluation, 10 minutes intra-service, and 4 minutes immediate post-service.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
76536		Ultrasound, soft tissues of head and neck (eg, thyroid, parathyroid, parotid), real time with image documentation	XXX	0.56 (No Change)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 50 year old asymptomatic female originally found to have multiple thyroid nodules on routine physical examination by gynecologist one year ago. Initial assessment, including thyroid ultrasound, revealed no evidence of malignancy at that time. Patient now returns for annual follow-up of this condition and thyroid ultrasound is performed to re-evaluate the nodules.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an I&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 1%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:
- Review pertinent clinical information, including history of thyroid or parathyroid disease and any previous thyroid biopsies
- Review any prior applicable imaging studies

Description of Intra-Service Work:

- Supervise technologist to ensure that the thyroid gland itself and any thyroid nodules have been measured in the same manner as the previous exam to facilitate accurate comparison review measurements of thyroid lobes and isthmus and assess for interval change in size between exams
- Evaluate overall echo texture of the thyroid
  Assess vascularity of the thyroid gland and thyroid nodules with color doppler imaging
  Review measurements of specific nodules and compare measurements to the previous exam
- Assess internal architecture of measured thyroid nodules for signs suggestive of tumor such as micro calcifications
- Evaluate and characterize surrounding anatomic structures to assess for possible adjacent lymphadenopathy or parathyroid tissue
- Generate report for the medical record

Description of Post-Service Work:

- Discuss significant findings such as change in nodule size or characteristics with the referring service
- Review and sign final report

dditional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACR, ASNR, AACE, and TES convened a panel that included a number of physicians familiar with this service to review the RUC survey data. The reference code selected most commonly was code 99214 (E/M service) with work value of 1.42. From the survey data the median recommended work value for code 76536 is 1.00, with times as follows: 5 min pre, 15 min intra, and 5 min post. The survey respondents indicated that code 76536 entails greater intensity and complexity than the 99214 reference code.

The societies are recommending the 25th percentile work value of 0.74 as well as the 25th percentile for physician time of 4 min pre, 10 min intra, and 4 min post. The panel believes that the 25th percentile values are more in line with another reference service code 76776 (Ultrasound, transplanted kidney, real time and duplex Doppler with image documentation), which was the second most commonly selected reference code. Code 76776 was recently RUC valued and has a work value of 0.76 with 5 min pre, 10 min intra, and 5 min post, which is similar in RVU and time to our respondents' 25th percentile times. As such our panel elected to recommend the 25th percentile times for 76536. If the median times were maintained, the closest reference in the ultrasound family would be the recently RUC valued obstetrical ultrasound code 76801 with 0.99 RVU with 5 min pre, 15 min intra and 7 min post. The panel is not recommending 76536 be valued at that level because it would create a substantial number of rank order anomalies with other RUC valued ultrasound codes.

Since this code is part of the Five Year Review process, we recognize that compelling evidence standards must be met to change the value from the existing value. This meets a number of the requisites including the following:

Compelling Evidence for Change in Value:
1) Since the original valuation, the patient population has changed due to the increasing incidence and prevalence of thyroid cancer. This increases the complexity of the typical patient. Careful full neck lymph node assessment is essential for all thyroid cancer patients.

2) The technology available including color flow and power Doppler evaluation and increased transducer resolution increases the complexity of the examination and the expectation of the information it can provide.

3) This code has never been RUC surveyed. Applying the current survey data to the existing value would create rank order anomalies as compared to other RUC surveyed ultrasound codes.

4) The current survey includes input from a number of specialties performing the procedure, some of which did not have input into the original valuation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 76536

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Endocrinology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1347000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services for 76536 in a one year period is estimated to be 915,960.

Specialty Radiology Frequency 915960 Percentage 68.00 %

Specialty Endocrinology Frequency 175110 Percentage 13.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 449,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2007 Medicare data estimates that CPT code 76536 was billed approximately 306,000 times.

Specialty Radiology Frequency 306000 Percentage 68.15 %

Specialty Endocrinology Frequency 56000 Percentage 12.47 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 76776. Physician work involved for code 76536 is more in line with code 76776.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
CMS Request

April 2009

Radiation Treatment Delivery, Stereotactic Radiosurgery – Practice Expense Recommendation Only

In the 2009 *Final Rule*, CMS received comments including one from a single free-standing non-facility provider stating that the there was a drastic difference in payment between the proposed OPPS payment $7,608 and the PFS payment $1,260. Further, the commenters stated that existing practice expense inputs are incorrect because they excluded extra clinical labor time due to Nuclear Regulatory Commission (NRC) requirements for both the physicist and the registered nurse. Because of these comments, CMS requested that practice expense inputs associated with this service be reviewed.

The RUC reviewed the direct practice expense inputs as presented by the specialty society in response to the CMS 2009 *Final Rule.* The specialty had requested an additional 99 minutes of clinical labor time to account for moderate sedation in the intra-service time. The specific recommended changes to the intra-service time were:

1892

1. The specialty also recommended the elimination of the Registered Technician time and reassigning the remaining activities to Medical Physicist. (RUC agreed)
2. Changing several clinical labor activities from RN/LPN/MA to RN (RUC did not agree)
3. The addition of 10 minutes to the post monitoring time. (RUC agreed)
4. The addition of 45 minutes of RN assist physician time during the procedure for conscious sedation (RUC agreed)
5. Additional 44 minutes of time for miscellaneous activities (RUC did not agree)

In addition, the specialty requested minor changes to supplies and equipment. The RUC agreed with the specialty that additional time, supplies, and equipment were necessary to provide the service, however the RUC agreed to only 54 minutes of additional clinical labor time to assist in intra service and post service monitoring for moderate sedation. **The RUC recommends an additional 54 minutes of clinical labor time and other recommended medical supplies and equipment direct practice expense inputs as recommended by the specialty society for CPT code 77371. The RUC also recommends this service be placed on CPT's appendix G to indicate that Moderate Sedation is inherent to the procedure.**

Re: CPT Code 77371 PE Recommendations

Attached are the revised PE recommendations for CPT Code 77371. In response to public comments received (not from ASTRO) CMS asked ASTRO to develop revised PE recommendations for this CPT code. In the MFS Final Rule for 2009 CMS discussed comments received. Commenters stated that:

> *The PE RVUs listed in Addendum B for CPT 77371 were exceptionally inadequate. The commenters also stated that they believe the direct PE inputs are incorrect since the cost data they had gathered from other facility providers of this stereotactic radiosurgery (SRS) service included extra clinical labor time due to Nuclear Regulatory Commission (NRC) requirements for both the physicist and the registered nurse. In addition, they disagreed with our decision to treat the Cobalt 60 radiation source (recommended by the AMA RUC as a 1-month renewable equipment item) as an indirect PE cost in the CY 2007 PFS final rule with comment period.*
> *(Federal Register / Vol. 73, No. 224 / Wednesday, November 19, 2008 / Rules and Regulations p.69737)*

CMS asked the AMA RUC to review the direct PE inputs for this code in light of these comments. In the interim, they believed the commenters raised sufficient questions regarding the propriety of the direct PE inputs and PE RVUs established for this new code in 2007 to warrant contractor pricing for CPT 77371 for CY 2009. The Medicare Part B Claims data for 2007 reports 50 claims, while the OPPS data has for 2007 reported approximately 4,000 claims.

Historical Information

Original PEAC Submission (Sept 2005) = 373 minutes
Approved PEAC (Sept 2005) = 234 minutes *(attachment)*
Current IRSA Request = 730 minutes (+496 minutes) *(attachment)*
Current Recommendations = 333 minutes (+99 minutes) *(attachment)*

Clinical Time

- Facility Time: No Changes
- Non Facility Time: Pre & Post No Changes

AMERICAN SOCIETY FOR RADIATION ONCOLOGY
8280 WILLOW OAKS CORPORATE DRIVE · SUITE 500 · FAIRFAX, VA 22031 · 800 962.7876 · 703.502 1550 · FAX: 703 502 7852
www.astro.org · www.rtanswers.org

- Non Facility: Intra Service Changes
    1. Total Intra Time increased from 222 minutes to 321 minutes
    2. Eliminated the RT and reassigned remaining activities to Medical Physics
    3. Changed post monitor time back to 30 minutes from 20 minutes
    4. Changed several nurse designated activities from RN/LPN/MA to RN

Supplies

Changes have been made to the supply list. We deleted several items related to (1) x-ray films and (2) starting the IV. We added miscellaneous supplies, such as the syringes (for administering meds through the IV during treatment), topical antibiotic, gauze, etc.

Equipment

Minor changes have been made to the equipment list. We added a stretcher, blood pressure monitor and the conscious sedation equipment items. We will contact IRSA representatives and requested that they provide copies of invoices to CMS for the updated prices on the Gamma Knife system and the Cobalt 60 sources.

The major issue that remains with the equipment list is the cost of the radioactive source(s). CMS policy currently treats the radioactive source for CPT Code 77371 as an indirect cost *(Federal Register / Vol. 71, No. 231 / Friday, December 1, 2006 / Rules and Regulations p.69747.)*

These recommendations are also supported by AANS. Please let us know if you have any questions.

AMA/Specialty Society Update Process
PEAC Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: **Radiation treatment delivery, stereotactic radiosurgery (SRS) (complete course of treatment of cerebral lesion(s) consisting of one session); multisource Cobalt 60 based. (For Radiation treatment management, use 77432)**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ASTRO developed these PE recommendations by Consensus Panel. The Panel had several radiation oncologists and medical physicists, including SRS experts. The Panel reviewed the historical information for CPT Code 77371 including the comments received by CMS. The recommendations were also discussed with AANS.

Please describe the clinical activities of your staff:

The head-frame has been previously attached by the neurosurgeon, as described in CPT Code(s) 61796 or 61798.

Pre-Service Clinical Labor Activities:
The pre-service period includes time allocated for: completing pre-service diagnostic and referral forms; coordinating pre procedure services; for the facility setting, scheduling the service; and finally providing education and obtaining the patient consent.

Intra-Service Clinical Labor Activities:
When the patient arrives at the office for their treatment, service requires the involvement of the Oncology Nurse, and the Medical Physicist (in addition to the Doctor). The physicist has acquired the data needed for the particular patient, and enters this data into the treatment machine. Once the data is entered, the nurse leads the patient into the treatment room.

The patient is taken into the treatment room, and the physician and the physicist together review the original and new films, the prescription, and the data that was entered into the treatment machine. To ensure the accuracy of the treatment setup, the physicist then verifies the stereotactic isocenter using the Winston-Lutz phantom test. While this is occurring, the nurse is assisting the patient in getting comfortable and then takes the patients vital signs, such as their temperature, blood pressure, pulse, and respiration. Once these vitals have been documented, the patient is then placed on the treatment couch. The nurse and physicist position the patient with the appropriate immobilization system, and the head ring is calibrated to the stereotactic isocenter and the test that were performed to validate the patient setup. Once the patient is then positioned, the nurse then inserts the IV for the patient, and the SRS treatment delivery begins.

During the treatment delivery, the nurse and physicist are in the room at all times to monitor the delivery procedure. The nurse will monitor the oxygen (O_2) saturation of the patient, as well as to track the shots of radiation that are given.

Post-Service Clinical Labor Activities:
After the last segment of radiation is given, the patient is taken out of the immobilization apparatus, and the neurosurgeon removes the head frame, as described in CPT Code(s) 61796, 61797, 61798 or 61799. The patient is then taken into a separate room for recovery for up to two hours. While the patient is resting, the nurse cleans the room and any of the materials that may have been used during the procedure, monitors vital signs, and provides post treatment education and schedules the follow up appointments.

Phone calls are made by the nurse to follow up on side effects and phone in prescriptions.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
CMS Request

April 2009

End Stage Renal Disease Practice Expense and Physician Time Recommendation

CMS requested in the 2009 *Final Rule*, that the RUC review the practice expense inputs associated with the end stage renal disease (ESRD) codes to ensure that they accurately reflect the typical direct resources required to perform these services and to review the physician time for 90960 and 90961.

Practice Expense Clinical Labor Time

The specialty society convened an expert panel to review the direct practice expense clinical labor time for the adult and pediatric ESRD codes. The specialty panel agreed that 42 minutes of clinical staff time, for all of the varied and unpredictable services to a typical patient with 6 co-morbid conditions and on more than 7 drugs over the course of a month, was not sufficient to reflect the clinical staff activities performed in support of monthly dialysis care. The specialty panel determined that an additional 24 minutes of clinical staff pre-service time for the pediatric codes and 18 additional minutes for the adult codes, would accurately reflect the services provided over an entire month. The clinical activities that the expert panel believed had been under-represented were:

(1) unscheduled follow up phone calls and prescription drug review-6 minutes (12 minutes for pediatrics patients)
(2) lab and x-ray review-3 minutes
(3) evaluation of dialysis access problems-3 minutes
(4) transplant evaluation-1 minute
(5) multidisciplinary care team meetings-5 minutes

By adding these clinical labor time increments both the pediatric and adult ESRD monthly codes would have a total of 60 minutes of clinical labor time. The RUC agreed with the addition of this clinical labor time. In addition, this monthly time of 60 minutes was recommended to be applied to all of the codes in the code family, including the home dialysis codes (CPT codes 90963-90966), and proportionately to the daily dialysis codes (CPT codes 90967-90970), the values for which have been historically based on 1/30th of the monthly code value.

The RUC therefore recommends that the monthly outpatient dialysis codes (CPT codes 90951-90966), representing both in-center and home dialysis care, be assigned an additional 24 minutes of clinical staff time per code for the pediatric codes and 18 minutes of clinical staff time per code for the adult codes, and that this revision also be applied proportionately to the daily dialysis service codes (CPT codes 90967-90970) to reflect the clinical staff activities currently necessary to provide services to the typical adult and pediatric ESRD patients. Therefore, the total clinical staff time for all monthly codes should now be 60 minutes.

Physician Time for CPT code 90960 and 90961

Upon reviewing the physician time for CPT codes 90960 and 90961, the RUC concurred with CMS that for practice expense purposes, the physician time needed additional review. The specialty noted that the unit level code, 90962, was provided with 38 minutes of physician time for Care Plan Oversight (from procedure code G0182), while the services with increased physician visits and activity, 90960 and 90961, were not. The RUC agreed that even though the physician time recommendations for codes 90960 and 90961 are based on a higher number of building blocks, the degree of care plan oversight activities for these services is no less than that for the unit level code and, for practice expense purposes, were not captured by the office visit building blocks currently comprising the recommendations for these services. **The RUC recommends that CPT codes 90960 and 90961 be assigned an additional 38 minutes of physician time for practice expense purposes to reflect the care plan oversight activities currently necessary to provide services to the typical adult ESRD patient. The new total time for CPT code 90960 is 128 minutes and 113 minutes for 90961.**

Re: Discussion of Recommendations for Practice Expense Value Clinical Staff Times for Monthly Adult and Pediatric Dialysis Services, and for Practice Expense Physician Times for CPT Codes 90960 and 90961

Introduction

This document is a proposal for the revaluation of the practice expense clinical staff times for the monthly dialysis services for both adult and pediatric patients, and for the physician times associated with two of the adult monthly dialysis codes, CPT code 90960 (adult monthly dialysis, four or more visits) and CPT code 90961 (adult monthly dialysis, 2-3 visits). This revaluation was prompted by a request from CMS as outlined in the final rule for the 2009 Medicare Physician Fee Schedule.

By way of review, these codes were originally valued at the February 2008 RUC meeting based on the use of a survey instrument vetted by the RUC Research Subcommittee and approved by the full RUC at the September 2007 RUC Meeting which attempted to use the 90 day global surgery form for obtaining a month's worth of work by the nephrologist caring for an ESRD patient. This instrument required the reporting of the physician separately from the physician extender services at the 85 percentile even though the physician extender did not bill independently and their work was part of that physicians bundle of services. The performance of the survey and the development of proposed values proved to be extremely difficult, due in most part to the unique nature of the monthly dialysis services themselves. This is a capitated payment where every patient receives a unique variety of services. Rather than seeking to determine the work associated with a single episode of care, for these monthly codes survey respondents had to account for the multiplicity of services and diversity of physician activity, as well as the attendant practice costs, necessary to provide the variable and unpredictable mix of services associated with appropriate care for an ESRD patient, over a month's time. The typical adult patient is over 65 years of age and has diabetes, hypertension and vascular disease as well as ESRD. The survey instrument approved by the RUC did seek to

provide an appropriate mechanism for capturing these activities and expenses, but challenges remained nonetheless.

These challenges were exacerbated on the pediatric side by the finite census of pediatric nephrologists in the U.S., and the small number of actual billed codes in the <2 year old and 2-11 year old age group, resulting in a limited survey response. It should be noted that children account for less than 2% of all ESRD patients, and thus the Medicare claims utilization for services provided to pediatric dialysis patients is of a similarly limited nature.

This document will discuss typical ESRD patients in aggregate, provide historical background on how the entire family of dialysis codes arrived at their current structure and were valued at the February 2008 RUC meeting, and offer recommendations for the reconsidering the clinical staff times for the entire code family, and the physician times for CPT codes 90960 and 90961.

ESRD Patients in Aggregate

Typically, adult ESRD patients suffer from a series of chronic illnesses in addition to their kidney disease, including Type II diabetes mellitus, vascular disease, and hypertension. There is an approximate 19% annual mortality rate among adult ESRD patients. The typical adult ESRD patient has 2.0 hospital admissions per year, or on average 14 hospitalization days per year.

Pediatric ESRD patients present unique challenges that impact the physician work and practice expense involved in providing their treatment. Children who require chronic dialysis have a wide spectrum of underlying diseases, including congenital renal anomalies present since birth, like renal dysplasia and obstructive uropathy, or rare hereditary diseases that present early in life, such as primary hyperoxaluria, cystinosis and autosomal recessive polycystic kidney disease, or rare acquired glomerular diseases, such as nephrotic syndrome from focal glomerulosclerosis, membranoproliferative GN, rapidly progressive GN, IgA nephropathy or hemolytic uremic syndrome. Less than 3% have underlying diabetes or hypertension as the cause of their ESRD. Before reaching ESRD, most of the children have long standing chronic kidney disease that has disrupted growth and development, compromised bone health and resulted in behavioral and learning problems and family dysfunction. Those with congenital anomalies have required multiple urologic surgeries. Many of the children with disease since infancy also have other organ failure, such as hypoplastic lung disease, congenital hepatic fibrosis, cardiomyopathy and spina bifida. Concomitant deafness and seizure disorders are common. The pediatric ESRD dialysis population is not just a healthy group of children who suddenly developed renal failure and were otherwise normal.

Infants requiring chronic dialysis present the biggest challenge and typically are the sickest with a disease burden that includes catheter access problems, renal osteodystrophy, anemia, acidosis, growth failure, developmental delay, anorexia and feeding problems, family dysfunction related to a technologically dependent infant, modified childhood

immunizations, and polypharmacy (>7 medications) and require more intensive physician services. Older children and adolescents will have similar disease burdens along with varying, age-dependent stages of behavioral issues. Infants are hospitalized an average of 3 times per year, and older children and adolescents between 2-2.5 times a year. Average yearly hospitalization days are 12 days for hemodialysis and 14 days for peritoneal dialysis patients. The most common causes of hospitalization are infection (including peritonitis and dialysis catheter line sepsis), malnutrition, fluid overload and dialysis access problems. Annual mortality for pediatric dialysis patients is about 100 times higher than for the general pediatric population, and the probability of 5-year survival for children on dialysis is only 0.81.

Historical Background of MCP Valuation—Bulleted Summary

- In the December 8, 1994 issue of the *Federal Register* setting forth the Medicare Fee Schedule for 1995, then-HCFA established a process for development of work values for the Monthly Capitated Payment (MCP) for ESRD services that utilized different office visit codes as "building blocks" for the MCP.

- HCFA noted that the mix of the "visit code building blocks most appropriately represents the typical mix of encounters with the ESRD patient who is dialyzed in an ESRD facility and accounts for the service intensity and complexity of decision-making and the pre-service and post-service work for a month's care of a typical dialysis patient."

- A panel of carrier medical directors (CMDs) that included a representative of the RUC determined that the appropriate building block mix for adults was four counts of the work RVUs for CPT code 99212 and two counts of the work RVUs for CPT code 99214 (representing a reduction from the original RUC recommendations). This resulted in a work RVU of 3.09 for CPT code 90921, rather than the higher RUC proposed bundle 5.24 work RVUs. The same building blocks were used for the pediatric codes, except with proportionally higher work values for infants, older children and adolescents (e.g. for <2 year old, 16 counts of CPT 99212 and 4 counts of CPT 99214 work RVUs; for 2-11 year old, 0.73x <2 year old CPT work RVUs; for 12-19 year old, 0.6x<2 year old CPT work RVUs).

- These values remained in place until the rulemaking cycle for the 2004 Medicare Fee Schedule, in which now-CMS established a stratified MCP payment system based on the number of face-to-face interactions between the MCP physician and the ESRD patient.

- This system established a mid-level adult MCP code (G-0318) based on the previous adult MCP code (CPT code 90921) and representing 2-3 physician-ESRD patient interactions, and provided additional RVUs for 4 physician-ESRD patient interactions (G-0317) and fewer RVUs for 1 physician-ESRD patient interaction (G-0319). This methodology was derived to be budget neutral rather

than fact based and also was applied to the pediatric series of monthly dialysis services, codes G-0308-G0310 for patients less than two years of age, codes G-0311-G0313 for patients between the ages of two and eleven, and codes G-0314-G0316 for patients ages twelve to nineteen. A new set of codes (G-0320-0323) were created for home dialysis and not based on actual number of face-to-face visits, but determined to be a level of RVUs equal to the 2-3 visit G-codes by age group.

- When the Five-Year Review of E&M Codes increased the work RVUs for selected E&M codes in 2006, the E&M value increases were applied to all global surgical packages with E&M elements. These increases were however not applied to the MCP family of ESRD MCP codes. As a result, RPA petitioned CMS to apply these increases in the MCP building block codes to the current MCP as part of its comments on the 2007 Medicare Fee Schedule Proposed Rule.

- RPA's recommendation called for CMS to revise the ESRD MCP codes based on the previously determined building blocks and using the mid-level code (G-0318) as an anchor since that code most closely approximated the previous adult MCP code (CPT code 90921), with the same methodology being applied to the pediatric series of monthly dialysis services. This recommendation would have increased the work RVUs for the adult codes by approximately 9% (from a WRVU of 4.24 for G-0318 to a WRVU of 4.64), and for the pediatric codes by approximately 21% (from a WRVU of 10.61 for G-0309 to a WRVU of 12.88). However, the recommendation was not accepted and CMS referred RPA to the RUC for valuation of the services associated with the ESRD MCP G-codes.

- In September 2007 the family of monthly dialysis codes was presented to the CPT Editorial Panel, and that proposal was accepted and referred to the RUC for valuation.

- In February 2008 the RUC valued the services for physician work and practice expense for the entire outpatient dialysis code family. The values generated by the RUC are available elsewhere in this tab.

- When CMS released the final rule for the 2009 Medicare Fee Schedule, it requested the RUC to review elements of the practice expense values that were developed by the RUC and included in the RUC recommendations sent to CMS in May 2008. Specifically, the Agency requested review of the clinical staff times for CPT codes 90951-90970, as well as the physician times (for practice expense purposes) of CPT codes 90960 and 90961.

- During the February 2009 RUC meeting, RPA/ASPN representatives proposed that 18 minutes of additional clinical staff time be added to the 42 minutes of clinical staff time assigned to the codes during the original review. These original 42 minutes were based on a direct crosswalk from the 36 minutes of

RN/LPN/MTA time assigned to CPT code 99375 (Care Plan Oversight) and six minutes of RN/LPN/MTA time for two phone calls.

- RPA/ASPN representatives also noted the structural similarity between the ESRD monthly services and activities associated with the recently valued medical home demonstration codes. The Tier 3 medical home patient was assigned 80 minutes of clinical staff time, and the Tier 2 medical home patient was assigned 66 minutes of clinical staff time, for treatment of patient populations generally with fewer co-morbid conditions and on fewer prescriptions.

- The RUC PE Subcommittee generally agreed that approximately 16 to 18 minutes of additional time seemed appropriate but referred RPA and ASPN to an informal facilitation group for development of a more structured proposal.

- The informal facilitation group determined that since using three different methodologies for determining the clinical staff time for the monthly codes brought the total to a range of 58-60 minutes, the correct value is likely within that range. The three methodologies were: (1) the PEAC methodology from 2002 that included CPT code 99211 as a building block for the codes at that time and would bring the total of clinical staff time for these services from 42 minutes to 58 minutes; (2) use of the clinical staff times from 99375, two phone calls, and 99211 (36 + 6 + 16 = 58 minutes); and (3) the use of the pre-service clinical staff time from 99375, two phone calls, and the staff time from 99213 (18 + 6 + 36 = 60 minutes). All three of these methodologies were transcribed into an Excel spreadsheet for distribution among the PE Subcommittee.

- At the subsequent meeting of the PE Subcommittee, once again it became apparent that while the subcommittee believed the 58-60 minute range was reasonable and appropriate, evaluating the proposal was difficult as the minutes were not indicated on the standard RUC PE form. Further, PE subcommittee members questioned the urgency of pursuing this code proposal at this meeting, noting that it might be better for RPA/ASPN to revise its proposal and pursue it at the April 2009 RUC meeting.

- CMS staff also underscored to RPA/ASPN representatives the fundamental role that physician times play in the development of practice expense values, and urged the subspecialties to review the physician times assigned to CPT codes 90960 and 90961 to ensure that the practice expense associated with these services is appropriately captured in the revised values.

Discussion of Practice Expense Relative Value Unit Recommendations

Clinical Staff Times for Outpatient Dialysis Services

As noted above, subsequent to CMS' request for review of the PE direct inputs for the monthly and daily dialysis codes, an RPA/ASPN expert panel evaluated the clinical staff

times assigned during the February 2008, and concurred with CMS that the inputs merited review.

Specifically, the expert panel believed that the 42 minutes of clinical staff time, again for a month's worth of varied and unpredictable services to a typical patient with 6 co-morbid conditions and on more than 7 drugs, was not sufficient to reflect the clinical staff activities performed in support of monthly dialysis care. The panel determined that with an additional 18 minutes of clinical staff pre-service time, the inputs would accurately reflect the month's services. Among the clinical activities that the expert panel believed had been under-represented: (1) unscheduled follow up phone calls and prescription drug review-6 minutes; (2) lab and x-ray review-3 minutes; (3) evaluation of dialysis access problems-3 minutes; (4) transplant evaluation-1 minute; and (5) multidisciplinary care team meetings-5 minutes. These values are indicated on the RUC PE form appended to this document.

The RPA/ASPN expert panel believes that these 18 minutes of additional clinical staff time should be applied to all of the monthly codes (both adult and pediatric) in the outpatient dialysis service family. It is our strong belief that it is appropriate that the PE be constant across the groupings of codes by age category, since all patients, regardless of the number of physician work/face-to-face encounters, require a similar baseline level of clinical staff support.

Since it is our belief that the recommendation above should apply to all of the codes in the code family, they thus should apply to the home dialysis codes (CPT codes 90963-90966), and proportionately to the daily dialysis codes (CPT codes 90967-90970), the values for which have been historically based on $1/30^{th}$ of the monthly code value.

RPA/ASPN therefore recommend that the monthly outpatient dialysis codes (CPT codes 90951-90966), representing both in-center and home dialysis care, be assigned an additional 18 minutes of clinical staff time per code, and that this revision also be applied proportionately to the daily dialysis service codes (CPT codes 90967-90970) to reflect the clinical staff activities currently necessary to provide services to the typical adult and pediatric ESRD patients.

Practice Expense Physician Times for CPT code 90960 and 90961

Upon reviewing the physician times for CPT codes 90960 and 90961, the RPA/ASPN expert panel again concurs with CMS that for practice expense purposes, the physician times merit additional review. Please recall that for the adult monthly dialysis codes, the RUC determined that a building block methodology should be utilized to evaluate these codes and accordingly made the following recommendations:

90960 *End-stage renal disease (ESRD) related services monthly, for patients twenty years of age and over; with 4 or more face-to-face physician visits per month*

1 – 99213 Office/Outpt Visit, Est	0.92	15 minutes

3 – 99214 Office/Outpt Visit, Est	(1.42 x 3) 4.26	75 minutes
90960	**5.18 RVUs**	**90 minutes**

90961 *End-stage renal disease (ESRD) related services monthly, for patients twenty years of age and over; with 2-3 face-to-face physician visits per month*

3 – 99214 Office/Outpt Visit, Est	(1.42 x 3) 4.26	75 minutes
90961	**4.26 RVUs**	**75 minutes**

90962 *End-stage renal disease (ESRD) related services monthly, for patients twenty years of age and over; with 1 face-to-face physician visit per month*

1 – G0182 Care Plan Oversight	1.73	38 minutes
1 – 99214 Office/Outpt Visit, Est	1.42	25 minutes
90962	**3.15 RVUs**	**63 minutes**

In reviewing the recommendations, the RPA/ASPN expert panel in retrospect noted the fact that the unit level code, 90962, was provided with 38 minutes of physician time for Care Plan Oversight (from procedure code G0182), while the services with increased physician visits and activity, 90960 and 90961, were not. It is RPA/ASPN's belief that even though the recommendations for codes 90960 and 90961 are based on a higher number of building blocks, the degree of care plan oversight activities for these services is no less than that for the unit level code and, for practice expense purposes, are not captured by the office visit building blocks currently comprising the recommendations for these services.

RPA therefore recommends that CPT codes 90960 and 90961 be assigned an additional 38 minutes of physician time for practice expense purposes to reflect the care plan oversight activities currently necessary to provide services to the typical adult ESRD patient.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
CMS Request

February 2009

Speech-Language Pathology

On July 15 2008, H.R. 6331 Medicare Improvements for Patients and Providers Act of 2008 was signed into law. Section 143 of HR 6331 specifies that speech-language pathologists may independently report services they provide to Medicare patients. Starting in July 2009, speech-language pathologists will be able to bill Medicare independently as private practitioners.

On October 9, 2008, the American Speech-Language-Hearing Association (ASHA) sent a request to CMS that in light of the recent legislation, speech-language pathology services be based on professional work values and not through the practice expense component. CMS requested that the RUC review the speech-language pathology codes for professional work as requested by ASHA. ASHA indicated that it will survey the 13 speech-language pathology codes over the course of the CPT 2010 and CPT 2011 cycles.

1930

At the February 2009 meeting, the RUC reviewed codes 92597 *Evaluation for use and/or fitting of voice prosthetic device to supplement oral speech* and 92610 *Evaluation of oral and pharyngeal swallowing function.*

92597

The RUC reviewed the survey data from 31 speech-language pathologists and 5 otolaryngologists for code 92597. The survey data between both specialties was comparable. The specialty societies confirmed that this service is not included in the 090-day global period of performing a laryngectomy 31360 *Laryngectomy; total, without radical neck dissection* or 31365 *Laryngectomy; total, with radical neck dissection* which does not involve placing a fistula or dilating a stoma. However, the specialty societies recommended and the RUC agreed that the survey respondents slightly overestimated the time required to perform this service. Therefore, the RUC recommends pre-service package 5-Non-facility procedure without sedation/anesthesia care (7 minutes evaluation), a reduction of the intra-service time by 15 minutes to 40 minutes, and the immediate post-service time by 2 minutes to 13 minutes. The RUC also compared 92597 to code 97001 *Physical therapy evaluation* (work RVU = 1.20, 4 minutes pre-, 30 minutes intra- and 8 minutes immediate post-service time) and determined that 92597 required slightly more work and time to perform than 97001. The RUC determined that the decrease in physician time and survey median work RVU of 1.48 appropriately reflects the work required to

perform this service. **The RUC recommends a work RVU of 1.48 for code 92597.**

92610

The RUC reviewed the survey data from 125 speech-language pathologists and 5 otolaryngologists for code 92610. The specialty society recommended and the RUC agreed that the survey respondents slightly overestimated the time required to perform this service. Therefore, the RUC recommends pre-service package 5-Procedure without sedation/anesthesia care (7 minutes evaluation), a reduction in the intra-service time by 10 minutes to 35 minutes, and a reduction of the immediate post-service time by 5 minutes to 10 minutes. The RUC also compared 92610 to codes 97001 *Physical therapy evaluation* (work RVU = 1.20, 4 minutes pre-, 30 minutes intra- and 8 minutes immediate post-service time) and 92557 *Comprehensive audiometry threshold evaluation and speech recognition* (work RVU = 0.60 and 3minute pre-time, 20 minutes intra-time and 5 minutes immediate post service time). The RUC determined that 92610 required slightly more work and time to perform than 97001 and required approximately double that of the time and work required for 92557. The RUC determined that the decrease in physician time and surveyed 25th percentile work RVU of 1.30 appropriately reflects the work required to perform this service. **The RUC recommends a work RVU of 1.30 for code 92610.**

1931

Practice Expense

The RUC recommends removing the associated speech-language pathologists' time from the direct practice expense inputs, as all physician and speech-language pathologist work is captured in the work RVU. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

PLI

The RUC recommends that code 92597 and 92610 be crosswalked to 92557.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
92597	Evaluation for use and/or fitting of voice prosthetic device to supplement oral speech	XXX	1.48
92610	Evaluation of oral and pharyngeal swallowing function	XXX	1.30

SUMMARY OF RECOMMENDATION

CPT Code:92597 Tracking Number Specialty Society Recommended RVU: **1.48**

Global Period: XXX RUC Recommended RVU: **1.48**

CPT Descriptor: Evaluation for use and/or fitting of voice prosthetic device to supplement oral speech

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male diagnosed with laryngeal carcinoma required a total laryngectomy and bilateral neck dissection. As part of the primary laryngectomy surgery, the surgeon created a tracheoesophageal fistula to permit alaryngeal communications via a voice prosthesis. Patient is evaluated for use of and fitted with a tracheoesophageal voice prosthesis.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review medical records, assemble materials for removal of sutures and for measurement, fitting, and placement of tracheoesophageal prosthesis

Description of Intra-Service Work: Instruct patient in procedure, examine and clean puncture site, remove suture holding the stent in place and remove catheter, dilate puncture site, prepare prosthesis for insertion, size the puncture, fit prosthesis, verify placement, instruct patient in use of prosthesis and verify patient can phonate and speak in sentences

Description of Post-Service Work: Discuss care, precautions, and cleaning of prosthesis with patient/family, write report, communicate with referring physician, write orders for patient supplies

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.42	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

Post-Service intensity/complexity	3.00	3.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has usea IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Speech-Language-Hearing Association (ASHA) conducted a survey of speech language pathologists (SLPs) and the American Academy of Otolaryngology-Head and Neck Surgery (AAO-HNS) also surveyed this code. A

total of 36 complete responses were received (31 from ASHA and 5 from AAO-HNS). This is the first set of work surveys which SLPs have completed so there is an absence of well-established reference codes for SLP services. (Currently, SLP time is valued only through the practice expense component.) The most frequently selected reference code was Code 99214, established office visit, which has an RVW of 1.42 and pre, intra and post time of 5, 25, and 10 minutes.

We are recommending an RVW of 1.48 based on the combined median survey data. We are also recommending professional time of 10 minutes pre, 40 minutes intra and 13 minutes post time. The pre, intra, and post times recommended are lower than the medians. This results in an IWPUT of about 0.024 which is much less than one-half of the IWPUT for the reference code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Speech-Language Pathology How often? Sometimes

Specialty Otolaryngology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 10000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We do not have reliable frequency data for this code since it is primarily performed in hospital settings which are billed to intermediaries. Therefore, the frequency data for this code in the RUC data base only reflects a fraction of the total billings. There were 1,727 total billings in the RUC data base mostly performed in the office setting. We estimate that at least twice that were performed on Medicare patients in the hospital setting resulting in a total volume of about 5,100 with most done on Medicare patients. We estimate that perhaps 10,000 are the total volume of procedures.

Specialty Speech-Language Pathology Frequency 8000 Percentage 80.00 %

Specialty Otolaryngology Frequency 2000 Percentage 20.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5100 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We do not have reliable frequency data for this code since it is primarily performed in hospital settings which are billed to intermediaries. Therefore, the frequency data for this code in the RUC data base only reflects a fraction of the total billings. There were 1,727 total billings in the RUC data base mostly performed in the office setting. We estimate that at least twice that were performed on Medicare patients in the hospital setting resulting in a total volume of about 5,100 with most done on Medicare patients. We estimate that perhaps 10,000 are the total volume of procedures.

Specialty Speech-Language Pathology Frequency 4080 Percentage 80.00 %

Specialty Otolaryngology Frequency 1020 Percentage 20.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale. 99214

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

SUMMARY OF RECOMMENDATION

CPT Code:92610 Tracking Number Specialty Society Recommended RVU: **1.30**

Global Period: XXX RUC Recommended RVU: **1.30**

CPT Descriptor: Evaluation of oral and pharyngeal swallowing function

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 75 year old out-patient with Parkinson's Disease complains of recent weight loss with limited food intake and increased time in eating. He also has difficulty swallowing some solids, gets food caught in his cheek and exhibits some choking with liquids. An assessment of the structures and functions of swallowing is completed using a variety of liquid consistencies and food textures.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 5%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review medical records, assemble materials for oral-motor examination, prepare materials for swallowing trials

Description of Intra-Service Work: Interview patient, evaluate oral-motor function, assess laryngeal function, evaluate swallowing function with continuum of liquid and solid boluses, introduce compensatory strategies, analyze and interpret results

Description of Post-Service Work: Discuss findings with patient/family, instruct caregiver on compensatory strategies, communicate with referring physician, refer for instrumental assessment if warranted

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Cardiology Services

93307, 93320, and 93325

In September 2007, the RUC made its recommendations for physician work and practice expense for then new code 93306 *Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, complete, with spectral Doppler echocardiography, and with color flow Doppler echocardiography.* Code 93306 is a bundled code comprised of codes 93307 *Echocardiography, transthoracic, real-time with image documentation (2D) with or without M-mode recording; complete*, 93320 *Doppler echocardiography, pulsed wave and/or continuous wave with spectral display (List separately in addition to codes for echocardiographic imaging); complete* and 93325 *Doppler echocardiography color flow velocity mapping (List separately in addition to codes for echocardiography).* At that time, the RUC made its practice expense recommendations based on the sum of the codes' parts. The RUC made minor edits to the recommended clinical labor and medical supplies, and the equipment was recommended to remain the same. These recommendations were then forwarded to CMS in 2008 for implementation in 2009.

In the 2009 Final Rule, CMS stated that prior to accepting the RUC's recommendation for code 93306, they would like the RUC to review the practice expense inputs of 93307, 93320, and 93325 to ensure that they are consistent with the recommended direct inputs for 93306. In the interim, they would continue to use the established practice expense RVUs for these services.

In February 2009, the RUC reviewed the practice expense inputs for codes 93307, 93320, and 93325 in comparison with 93306. The RUC understood that the sum of the practice expense inputs of codes 93307, 93320, and 93325 should be greater than the inputs for code 93306 because of economies of scale. The RUC agreed with the specialty's recommendations for clinical labor, medical supplies, and equipment. **The RUC recommends the attached practice expense direct inputs for codes 93307, 93320, and 93325.**

93510 - 93556

As follow-up to a letter sent by the American College of Cardiology (ACC) in the summer of 2008, the ACC addressed the severe discrepancies in Medicare reimbursement for select services performed inside and outside the hospital setting, and had asked that CMS maintain the non-facility practice expense RVUs at the 2008 level until the agency can implement new indirect cost data that is representative of the providers of these services. In September 2008, the CMS then asked the RUC review the practice expense inputs of cardiac catheterization procedures (93510 – 93556) at its February 2009 meeting. At the meeting, ACC maintained that it continues

to agree with the direct practice expense input recommendations submitted by the RUC and accepted by CMS in 2007, and recommended no changes in the direct practice expense at this meeting. **The RUC agreed with the specialty and recommends no changes in the practice expense inputs for CPT codes 93510, 93543, 93545, 93555 and 93556.** The ACC noted that the society is developing a code proposal to re-write cardiac catheterization codes as bundled procedures for initial discussion at the June 2009 CPT Meeting.

93017

As follow-up to a letter sent by the American College of Cardiology (ACC) in the summer of 2008, the ACC addressed the severe discrepancies in Medicare reimbursement for select services performed inside and outside the hospital setting, and had asked that CMS maintain the non-facility practice expense RVUs at the 2008 level until the agency can implement new indirect cost data that is representative of the providers of these services. In September 2008, the CMS then asked the RUC review the practice expense inputs of cardiac catheterization procedures (93510 – 93556) at its February 2009 meeting. At the meeting, ACC maintained that it continues to agree with the direct practice expense input recommendations submitted by the RUC and accepted by CMS in 2007, and recommended no changes in the direct practice expense at this meeting. **The RUC agreed with the specialty and recommends no changes in the practice expense inputs for CPT code 93017.**

1949

CPT Code	CPT Descriptor	Global Period	Recommendation
93017	Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; tracing only, without interpretation and report	XXX	No Recommendation to Change PE Inputs
93307	Echocardiography, transthoracic, real-time with image documentation (2D) with or without M-mode recording; complete	XXX	PE Recommendation Only
93320	Doppler echocardiography, pulsed wave and/or continuous wave with spectral display (List separately in addition to codes for echocardiographic imaging); complete (Use 93320 in conjunction with 93303, 93304, 93307, 93308, 93312, 93314, 93315, 93317, 93350)	XXX	PE Recommendation Only

December 20, 2008

William L. Rich, MD, FACS
Chair, Relative Value Update Committee
American Medical Association
515 N State St
Chicago IL 60610

Dear Dr. Rich:

The American College of Cardiology (ACC) notes that there was a CMS request to review practice expense inputs for cardiac catheterization procedures (codes 93510-93556) at the January 2009 RUC meeting. This issue was placed on the RUC agenda as the result of a CMS response to a letter sent by ACC in the summer of 2008.

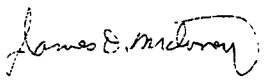
In that letter, the ACC addressed the recent changes in practice expense methodology that had caused a substantial reduction in payment for cardiac catheterization services performed in the physician office setting. In that letter, the ACC stated that it did not challenge the practice expense inputs that had been recommended by the RUC and accepted by CMS in 2007, but did have some concerns about the applications of two policies, one of which is relevant to RUC activities.

CMS has not assigned a technical and professional split for the injection procedures (93539-93545) that accompany the cardiac catheterization procedures, which means that those outpatient cardiac catheterization facilities that are organized and categorized as independent diagnostic testing facilities are unable to receive payment for the technical portion of those services.

It is not the understanding of the ACC that the RUC has ever been asked to deliver an opinion on a technical and professional component split and that this process is automatically performed based on a CMS formula. Therefore, the ACC has not recommended any changes to the practice expense inputs for cardiac catheterization. The ACC asks that the RUC reaffirm this policy that technical and professional component splits are established by CMS and support the ACC recommendation that these injection procedures be assigned such values according to the normal formula.

In addition to the issues identified above, it should be noted that the ACC is currently working to rewrite all of the cardiac catheterization codes as bundled procedures under the direction of the Joint CPT/RUC Workgroup that identified code pairs that are commonly reported together. The ACC intends to submit this proposal in February of 2009 for discussion at the June 2009 CPT Editorial Panel meeting. If the panel approves the changes recommended by the ACC, the existing cardiac catheterization codes will be deleted in 2011.

Sincerely,



James Maloney, MD
RUC Advisor

However, we are currently using the indirect practice cost index (IPCI) associated with cardiology to calculate 95 percent of the rates for these services. Since cardiology has the highest IPCI, these services receive high indirect cost payments relative to almost all other physician fee schedule services. We will review the issue further when we incorporate the data from the new physician practice expense survey currently being conducted by the American Medical Association.

Physician Fee Schedule Payment vs. Outpatient Hospital Payment

Services performed in outpatient cardiac catheterization labs are paid under the physician fee schedule. We must follow the statutory formula for setting payments under this system. Payment for similar services under the hospital Outpatient Prospective Payment System (OPPS) will be different because the law requires that we pay for those services under a different methodology. In addition, we expect that the overhead associated with operating an outpatient hospital would be substantially different from the overhead associated with operating a clinic or other free standing facility such as a cardiac catheterization lab.

AMA RUC

The CMS has worked with the Cardiovascular Outpatient Center Alliance (COCA) extensively this past year in regard to their concerns related to the current and future practice expense RVU calculations associated with cardiac catheterization services. We have met with COCA on numerous occasions to discuss their concerns. In December 2007, COCA provided CMS with their revised direct cost inputs for review. CMS analyzed these data in comparison to the RUC recommended data and did not identify any problems with the direct cost inputs recommended to CMS by the RUC. However, we decided to again request that the RUC review the direct cost inputs for cardiac catheterization services. We informed the RUC that COCA believed that the current RUC process to establish direct cost inputs may not be appropriate for cardiac catheterization services. We requested that the RUC consider these concerns when they send out a level of interest (LOI) solicitation to the specialty societies for these common procedural codes (CPT). To date, CMS has not received any recommended changes from the RUC regarding the direct cost inputs for these services.

However, based on the concerns outlined in your letter, CMS will once again request that the RUC send out another LOI on all of the cardiac catheterization and injection services for review at an upcoming RUC meeting. This will be the third time that CPT codes 93510, 93543, 93545, 93555, 93556, 93307, 93320, 93325, and 93017 have been examined by the RUC.

I appreciate you making us aware of your concerns and hope this information is helpful.

Sincerely,

Jeffrey B. Rich, M.D.
Director
Center for Medicare Management

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
CMS Request

April 2009

Cardiac Device Monitoring

In the 2009 *Final Rule*, CMS stated that these services were not reviewed with the other cardiac device monitoring services, that were reviewed by the RUC in April 2008. CMS requested that these codes, as part of the family of cardiac device monitoring codes, be reviewed.

The RUC reviewed their previous recommendations for the cardiac device monitoring codes from April 2008 and determined that the wearable holter monitor codes may be not be in the proper rank order. The RUC agreed that the recently reviewed device monitoring codes relative values are based on 30 days and the wearable monitor codes, not reviewed as part of this family, are based on 24 hours of work, yet are valued the same. **The RUC recommends that the wearable cardiac monitoring family of codes, 93224-93272, that have work RVUs be referred to CPT for revision and resurvey.**

1960

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
93230	Wearable electrocardiographic rhythm derived monitoring for 24 hours by continuous original waveform recording and storage without superimposition scanning utilizing a device capable of producing a full miniaturized printout; includes recording, microprocessor-based analysis with report, physician review and interpretation	XXX	Refer to CPT Editorial Panel with entire family of codes 93224-93272
93233	Wearable electrocardiographic rhythm derived monitoring for 24 hours by continuous original waveform recording and storage without superimposition scanning utilizing a device capable of producing a full miniaturized printout; physician review and interpretation	XXX	Refer to CPT Editorial Panel with entire family of codes 93224-93272

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Measure Blood Oxygen Level

In October 2008 the RUC's Five Year Identification Workgroup reviewed 94762 *Noninvasive ear or pulse oximetry for oxygen saturation; by continuous overnight monitoring (separate procedure)* as part of the CMS Fastest Growing Procedures screen and noted that it consists of practice expense only, with independent testing facilities predominantly performing this procedure. The Workgroup recommended that this code and the other codes in the family (94760 *Noninvasive ear or pulse oximetry for oxygen saturation; single determination* and 94761 *Noninvasive ear or pulse oximetry for oxygen saturation; multiple determinations (eg, during exercise)*) be referred to the RUC's Practice Expense Subcommittee for review of the direct practice expense inputs.

In January 2009 the RUC carefully reviewed the typical clinical labor, medial supplies, and equipment recommended by the specialty society for codes 94760, 94761, and 94762. The RUC made few edits and changes and agreed with the modified specialty recommendations. **The RUC recommends the attached direct practice expense inputs for codes 94760, 94761, and 94762.**

1961

CPT Code	CPT Descriptor	Global Period	Recommendation
94760	Noninvasive ear or pulse oximetry for oxygen saturation; single determination	XXX	Practice Expense Inputs Only
94761	Noninvasive ear or pulse oximetry for oxygen saturation; multiple determinations (eg, during exercise)	XXX	Practice Expense Inputs Only
94762	Noninvasive ear or pulse oximetry for oxygen saturation; by continuous overnight monitoring (separate procedure)	XXX	Practice Expense Inputs Only

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor:
94760 Noninvasive ear or pulse oximetry for oxygen saturation; single determination
94761 Noninvasive ear or pulse oximetry for oxygen saturation; multiple determinations (eg, during exercise)
94762 Noninvasive ear or pulse oximetry for oxygen saturation; by continuous overnight monitoring (separate procedure)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
The practice expenses were developed by the ACCP Practice Management Committee and the American Thoracic Society Clinical Practice Committee. There is good practice-type and geographical representation with the two pulmonary groups involved.

Please describe the clinical activities of your staff:
Pulse oximetry is performed to monitor saturation of arterial blood oxygen levels and heart rate to assess patient oxygenation and monitor treatment and interventions, requiring physician oversight and the adherence of staff following protocol. Pulse oximetry is performed by trained personnel in a variety of settings, for example, hospitals, clinics, office and home.
94760 (single) and 94761 (multiple) and 94762 (overnight)
Pre-Service Clinical Labor Activities:

- Obtain a physician's order including indication for monitoring and alarm limits for multiple determinations or overnight monitoring.
- A focus history is taken, and vital signs obtained.

Intra-Service Clinical Labor Activities:

- Remove blue, black, green or any metallic flaked nail polish with an acetone pad.
- The age-appropriate sensor is selected and placed appropriately on an area where light passes through a capillary bed. In adult patients, the sensors may be placed on the ear, finger, toes or feet.
- Perfusion at the sensor site is assured by signal strength, plethysomograph waveform or perfusion readings on the pulse oximeter.
- The patients palpable pulse rate is compared with the pulse rate indicated on the pulse oximeter.
- Sensor site should be periodically checked and changed if indicated, per manufactures recommendation depending on the site used (every 2 - 8 hours).
- For multiple determinations and overnight monitoring (94761 and 94762), Hi and Low alarm limits must be set. Alarm volume and alarm delay must also be set.

Post-Service Clinical Labor Activities:

- Document the SpO2 findings and the clinical decisions based on the measurement in the medical record, detailing the conditions under which the readings were obtained: probe site, inspired oxygen concentration or flow, and alarms settings.
- In addition, for 94762 overnight pulse oximetry data is downloaded and evaluated. This becomes part of the patient's medical record.

Subject: HCPAC Recommendations

Dear Ms. Bassano:

It is with pleasure that we submit to the Centers for Medicare and Medicaid Services (CMS), on behalf of the RUC Health Care Professionals Advisory Committee (HCPAC) Review Board, work relative value and direct practice expense inputs for the American Speech Language Hearing Association/CMS Request codes for CPT 2010.

These work relative value and direct practice expense input recommendations address Speech-Language Pathology codes 92526 *Treatment of swallowing dysfunction and/or oral function for feeding* and 92611 *Motion fluoroscopic evaluation of swallowing function by cine or video recording*.

The RUC HCPAC Review Board looks forward to continued CMS representation at our meetings and your effort to ensure a fair review of the enclosed recommendations.

If you have any questions please contact AMA staff, Susan Clark, at (202) 789-7495 or via e-mail at Susan.Clark@ama-assn.org.

Sincerely,

Arthur R. Traugott, MD

Summary of Recommendations
CMS Request

February 2009 and April 2009

Speech-Language Pathology Services

On July 15 2008, H.R. 6331 Medicare Improvements for Patients and Providers Act of 2008 was signed into law. Section 143 of HR 6331 specifies that speech-language pathologists may independently report services they provide to Medicare patients. Starting in July 2009, speech-language pathologists will be able to bill Medicare independently as private practitioners.

On October 9, 2008, the American Speech-Language-Hearing Association (ASHA) sent a request to CMS that in light of the recent legislation, speech-language pathology services be based on professional work values and not through the practice expense component. CMS requested that the RUC review the speech-language pathology codes for professional work as requested by ASHA. ASHA indicated that it will survey the 13 speech-language pathology codes over the course of the CPT 2010 and CPT 2011 cycles.

1967

92611

In February 2009, the HCPAC reviewed the American Speech-Language-Hearing Association (ASHA) recommendation for 92611 *Motion fluoroscopic evaluation of swallowing function by cine or video recording.* The HCPAC recognized that since this speech language pathology service is converting from practice expense only inputs to work, survey respondents had limited reference services to identify with. The HCPAC reviewed the pre-service time and determined that 7 minutes of pre-service time appropriately accounted for the time required to review the patients medical records, review the patient history, prepare the barium liquids, prepare items of different consistencies, and dress in the appropriate radiation deterrent gowns. The HCPAC reviewed the intra-service time and determined that 30 minutes appropriately accounted for the time to feed the patient the numerous substances while watching the video fluoroscopy and make determinations on the subsequent liquid consistencies to utilize and patient posture to employ. The HCPAC reviewed the immediate post-service time survey results and recommended reducing the time from 15 minutes to 10 minutes. The HCPAC determined that 10 minutes of immediate post-operative time appropriately accounts for time required discussing findings with the patient/family, writing a report and communicating necessary information with the referring physician.

The HCPAC compared 92611 to 97001 *Physical therapy evaluation* (work RVU = 1.20, 4 minutes pre-service, 30 minutes intra-service, and 8 minute post-service time) and 92602 *Diagnostic analysis of cochlear implant, patient younger than 7 years of age; subsequent reprogramming* (work RVU = 1.30, 5 minutes pre-service, 50 minutes intra-service, and 10 minutes immediate post-service time). The HCPAC determined that 92611 is more intense than 97001 and 92602 as more management and follow-up strategy determination is required.

The HCPAC also compared 92611 to code 99203 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU = 1.34, pre-service time = 4 minutes, intra-service time = 20 minutes and immediate post-service time = 5 minutes), and determined that the survey 25th percentile work RVU of 1.34 is identical to 99203 and appropriately accounts for the work required to perform this service. **The HCPAC recommends a work RVU of 1.34 for code 92611.**

In April 2009, the HCPAC reexamined code 92611 to assure no rank order anomaly exists with the two codes which were reviewed at the RUC in February 2009 (92597 *Evaluation for use and/or fitting of voice prosthetic device to supplement oral speech* (RUC recommended work RVU = 1.48) and 92610 *Evaluation of oral and pharyngeal swallowing function* (RUC recommended work RVU = 1.30). **The HCPAC reaffirmed the recommended physician work RVU of 1.34 for code 92611 which was reviewed in February 2009.**

1968

92526

At the February 2009 HCPAC meeting the HCPAC reviewed code 92526 *Treatment of swallowing dysfunction and/or oral function for feeding.* After a robust discussion of the intra-service work and episodes of therapy, the HCPAC recommended postponing recommending a work value for this service until additional frequency data was gathered, the length of treatment session was defined and the RUC had reviewed codes 92597 *Evaluation for use and/or fitting of voice prosthetic device to supplement oral speech* and 92610 *Evaluation of oral and pharyngeal swallowing function.*

In April 2009, the HCPAC reviewed code 92526 and determined that it is typically performed 10 times to treat dysphagia in the outpatient setting, approximately once a week. The HCPAC recognized that since this speech-language pathology service is converting from practice expense only inputs to work, that survey respondents had limited reference services to identify with. The HCPAC reviewed the pre-service time and determined to decrease the surveyed pre-time to 5 minutes as it appropriately accounts for the time required to review the previous progress note and prepare the materials. The HCPAC reviewed the intra-service time and determined that 45 minutes appropriately accounted for the time to instruct a variety of oral motor and pharyngeal/laryngeal swallow exercises and assess the patient's ability to achieve criterion performance levels of a variety of therapy activities. The HCPAC

reviewed the immediate post-service time and agreed with the specialty society recommended reduction to 5 minutes. The HCPAC determined that 5 minutes appropriately accounts for time required discussing findings with the patient/family and writing a report.

The HCPAC compared 92526 to codes 97001 *Physical therapy evaluation* (work RVU = 1.20, 4 minutes pre-service, 30 minutes intra-service, and 8 minute post-service time) and 97003 *Occupational therapy evaluation* (work RVU = 1.20, 7 minutes pre-service, 45 minutes intra-service, and 5 minutes immediate post-service time). The HCPAC determined that 92526 is more intense than 97001 and 92602 as the type of patient is more fragile and typically cognitively impaired/post CVA. **The HCPAC recommends a work RVU of 1.34 for code 92526.**

Practice Expense
The HCPAC recommends removing the previous speech-language pathologist's time from the practice expense inputs for codes 92526 and 92611, as well as replacing outdated recording output VHS tape with a DVD for the non-facility setting for code 92611.

PLI
The HCPAC recommends that codes 92526 and 92611 be crosswalked to 92557.

CPT Descriptor: Treatment of swallowing dysfunction and/or oral function for feeding

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70 year-old male patient, 1 week post-CVA, presents with swallowing dysfunction contributing to weight loss, choking and possible aspiration. The treatment plan calls for treatment of oral and pharyngeal phase problems.

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 4%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review of previous progress note, preparation of materials

Description of Intra-Service Work: Interview of patient re: past home practice. Instruct in variety of oral motor and pharyngeal/laryngeal exercises and assess patient's ability to perform each in 2 sets of 10.

Description of Post-Service Work: Discuss progress with patient/family, write note, write home exercises for patient

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.42	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

Intra-Service intensity/complexity	5.00	4.00
Post-Service intensity/complexity	3.00	3.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Speech-Language-Hearing Association (ASHA) conducted a survey of speech language pathologists (SLPs). A total of 121 complete responses were received. This is the first set of work surveys which SLPs have completed so there is an absence of well-established reference codes for SLP services. (Currently, SLP time is valued only through the practice expense component.). The most frequently selected reference code was Code 99214, established office visit, which has an RVW of 1.42 and pre, intra and post time of 5, 25, and 10 minutes.
We are recommending an RVW of 1.34 based on the median RVW of the survey responses. We are also recommending professional time of 5, 45, and 5 minutes respectively. We are recommending a reduction of the median pre and post survey time to 5 minutes each. This code is done a number of times for an individual patient and there is an economy of scale in the pre and post time which the survey respondents might not have fully factored into their estimate. We do believe that the median survey estimate for intra time is a very reasonable estimate. This results in an IWPUT of 0.025 which is about a little over half of the IWPUT of the selected reference code (0.045).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Speech-Language Pathology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1933691
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We used the Medicare number and added 25% to estimate the number of times this might be performed nationally.

Specialty Speech-Language Pathology Frequency 1933691 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,546,953 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This number came from 2002 Medicare information

Specialty Speech-language pathology Frequency 1546953 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 92557

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 21 **% of respondents:** 38.1 %

TIME ESTIMATES (Median)	CPT Code: 92611	Key Reference CPT Code: 99214	Source of Time RUC Time
Median Pre-Service Time	7.00	5.00	
Median Intra-Service Time	30.00	25.00	
Median Immediate Post-service Time	10.00	10.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	

Prolonged Services Time	0.0	0.00
Median Total Time	**47.00**	**40.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	5.00	4.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.00	4.00
Urgency of medical decision making	5.00	4.00

Technical Skill/Physical Effort (Mean)

Technical skill required	5.00	4.00
Physical effort required	3.00	3.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	5.00	3.00
Outcome depends on the skill and judgment of physician	5.00	4.00
Estimated risk of malpractice suit with poor outcome	4.00	4.00

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.00	3.00
Intra-Service intensity/complexity	5.00	4.00
Post-Service intensity/complexity	4.00	4.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Speech-Language-Hearing Association (ASHA) conducted a survey of speech language pathologists (SLPs) who provide this service. A total of 56 complete responses were received. This is the first set of work surveys which SLPs have completed so there is an absence of well-established reference codes for SLP services. (Currently, SLP time is valued only through the practice expense component.). The most frequently selected reference code was Code 99214 established patient office visit, which has an assigned RVW of 1.42 and pre, intra and post time of 5, 25 and 10 minutes respectively .

We are recommending an RVW of 1.50 based on the median survey data and the complexity and the risk of the service. We are recommending an RVW of 1.50 based on the median survey data, as well as the complexity and risk of the service. The procedure is performed by a speech-language pathologists specializing in dysphagia, that is, not by all speech-language pathologists. There is a great risk to the patient if the evaluation is not performed correctly because an incorrect diagnosis can lead to faulty intervention not to mention the possibility of aspiration pneumonia. We are also recommending professional time of 10, 30 and 15 minutes post time. This results in an IWPUT of about 0 031 which is about one-quarter less than the IWPUT for the reference code although the surveyed code was rated more complex.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT 92611 is reported with 74230 Swallowing function, with cineradiography/videoradiography. The RUC database shows a work RVU of 0.52 and 12 minutes total physician time for the radiological service with no differentiation of pre, intra, and post times. The speech-language pathologist's procedure is independent of that of the radiologist.

3.

CPT	Global Period	Work RVU	Total Time
74230	XXX	0.52	12 minutes

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Speech-Language Pathology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 467200
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Speech-Language Pathology Frequency 467200 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 359,375 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Speech-Language Pathology Frequency 359375 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 92557

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical
