Subject: RUC Recommendations

Dear Ms. Bassano:

The American Medical Association (AMA)/Specialty Society RVS Update Committee (RUC) submits the enclosed recommendations for work relative values and direct practice expense inputs to the Centers for Medicare and Medicaid Services (CMS). These recommendations relate to new and revised codes for *CPT 2010*, as well as to existing services identified by the RUC's Five-Year Review Identification Workgroup and CMS. If implemented, the RUC recommendations should result in a positive adjustment to the Medicare conversion factor.

Cost estimates for medical supplies and equipment not listed on the "CMS labor, Supply, and Equipment List for the Year 2010" are based on provided source(s) as noted, such as manufacturer's catalogue prices and may not reflect the wholesale prices, quantity, or cash discounts, prices for used equipment or any other factors that may alter the cost estimates. The RUC shares this information with CMS without making specific recommendations on the pricing for supplies and equipment.

CPT 2010 New and Revised Codes

Enclosed are two binders containing RUC recommendations, including those for new and revised CPT codes. The total number of coding changes for *CPT 2010* is 288, including 119 additions, 128 revisions, and 41 deletions. Twenty-Nine of these new and revised codes are not payable on the RBRVS (eg, laboratory services and vaccines), and accordingly, the RUC does not submit any information on these codes. The RUC submits recommendations for 218 new and revised CPT codes. The RUC is recommending that three of these codes be contractor priced in 2010. 121 of the RUC recommendations for new and revised codes initially originated from the Five-Year Review process.

Existing Services Identified by RUC and CMS for Review

The majority of the RUC recommendations for new/revised codes relate to the initial identification of services by the RUC's Five-Year Review Identification Workgroup, followed by action of the CPT Editorial Panel. The *Table of Contents* clearly articulates the category of review for each of the services. In addition, the RUC submits recommendations for 160 services identified by the RUC or CMS as potentially misvalued. The RUC recommends that 87 CPT codes require either modifications to descriptors or clarification within *CPT Assistant.* The work and/or practice expense were reviewed for 65 services. The RUC has recommended that CMS review claims data for seven services and will have no further comment on these codes, unless CMS requests review. Finally, the RUC requests that CMS consider a change in the global period for 66761 *Iridotomy/iridectomy by laser surgery (eg, for glaucoma) (1 or more sessions)* from 90 days to 10 days. A summary table of these recommendations is included in the attached binder. Also included in these binders, and on the enclosed CD are:

- RUC Recommendation Status Report for New and Revised Codes
- RUC Recommendation Status Report for more than 500 services identified to date by the Five-Year Workgroup and CMS as potentially misvalued.
- RUC Referrals to the CPT Editorial Panel – both for CPT nomenclature revisions and *CPT Assistant* articles.
- Physician Time File: A list of the physician time data for each of the CPT codes reviewed at the September 2008, February 2009, and April 2009 RUC meetings.
- Pre-Service Time Packages Table: The RUC has recently developed physician pre-service time packages which have been incorporated into these recommendations. The intent of these packages is to streamline the RUC review process as well as create standard pre-service time data for all codes reviewed by the RUC.
- PLI Crosswalk Table: The RUC has committed to selecting appropriate professional liability insurance crosswalks for new and revised codes and existing codes under review. We have provided a PLI Crosswalk Table listing the reviewed code and its crosswalk code for easy reference. We understand that several of the RUC recommendations for decreased PLI relative values were not implemented in 2009, resulting in $11 million in excess payments for certain services. We hope that the provision of this table will assist CMS in reviewing and implementing the RUC recommendations.
- New Technology List and Flow Chart – In April 2006, the RUC adopted a process to identify and review codes that represent new technology or services that have the potential to change in value. To date, the RUC has identified 139 of these procedures through the review of new CPT codes. A table of these codes identified as new technology services is enclosed, as well as a flow chart providing a detailed description of the process to be utilized to review these services.

2012 Five-Year Review Process

The RUC played an instrumental role in the 1997, 2002 and 2007 Five-Year Review processes to review the physician work component of the Resource-Based Relative Value Scale (RBRVS). This review is required according to Section 1848(C)2(B) of the Omnibus Budge Reconciliation Act of 1990, which requires the CMS to comprehensively review all relative values at least every five years and make any needed adjustments. The RUC submits this proposed process, work plan, and timetable for CMS to consider in its planning for this upcoming review.

This proposal will use the framework and ground rules from the previous Five-Year Review to outline a process, work plan, and timeframe for the upcoming Five-Year Review to begin in February 2010 and conclude with the implementation of the values on January 1, 2012. The timeline for this Five-Year Review will be similar to the previous processes. The RUC looks forward to working with CMS in this fourth Five-Year Review of current services in the Physician Payment Schedule.

We appreciate your consideration of these RUC recommendations. If you have any questions regarding the attached materials, please contact Sherry Smith at (312) 464-5604.

On a personal note, I want to convey my utmost respect and appreciation to the CMS staff that observe our RUC meetings. My term as RUC Chairman concludes on May 31. Doctor Barbara Levy will assume the role on June 1. I know that Doctor Levy will continue to work closely with you to ensure that the RUC recommendations are accepted and implemented by CMS.

Sincerely,

William L. Rich, III, MD, FACS

AMA/Specialty Society RVS Update Committee

Five-Year Review of the Work Component of the RBRVS
Proposed Process, Work Plan, and Timetable
May 2009

The American Medical Association (AMA)/Specialty Society RVS Update Committee (RUC) played an instrumental role in the 1997, 2002 and 2007 Five-Year Review processes to review the physician work component of the Resource-Based Relative Value Scale (RBRVS). This review is required according to Section 1848(C)2(B) of the Omnibus Budge Reconciliation Act of 1990, which requires the Centers for Medicare and Medicaid Services (CMS) to comprehensively review all relative values at least every five years and make any needed adjustments. CMS is expected to announce the initiation of the 2012 Five-Year Review in the November 2009 *Final Rule* and call for comments on the physician work relative values. The RUC submits this proposed process, work plan, and timetable for CMS to consider in its planning for this upcoming review.

This proposal will use the framework and ground rules from the previous Five-Year review to outline a process, work plan, and timeframe for the upcoming Five-Year Review to begin in February 2010 and conclude with the implementation of the values on January 1, 2012. It should be noted that the time for this Five-Year Review will be similar to the previous processes, as the RUC will have approximately seven months to complete its review.

Historical Overview of Previous Five-Year Review Processes:

On February 23, 1995, the Health Care Financing Administration (HCFA) sent 70 comments on approximately 700 codes to the AMA/Specialty Society RVS Update Committee (RUC) to review and develop specific work relative value unit (RVU) recommendations for submission back to HCFA by September 1995. HCFA also forwarded comments from Medicare Carrier Medical Directors (CMDs) for 300 codes. In addition, large studies from the American Society of Anesthesiology and the American Academy of Orthopaedic Surgeons were sent for review. The American Academy of Pediatrics had also requested more than 1,500 new CPT codes to identify varying levels of work from different age groups. The RUC took on the challenge of reviewing this magnitude of codes and delivered the recommendations to HCFA, on time, seven months after receiving notice of the specific codes to be reviewed.

The RUC accomplished this task by developing a detailed process, work plan, and timetable prior to the submission of the codes to HCFA. The RUC's efforts were successful, as more than 93% of the RUC recommendations were accepted by HCFA, with a greater number accepted after a refinement panel review. Many anomalies in the RBRVS were corrected, including gynecological and neurosurgical services. In addition, the work relative values for the Evaluation and Management services were increased,

both for the individual codes and all of the codes with global surgical periods. The 1997 Five-Year Review did not result in increases for all codes as the RUC also recommended decreases for more than 100 codes.

In the November 2, 1999 *Final Rule*, HCFA announced the second, Five-Year Review (2002) and stated its intention to share comments the agency received with the RUC. HCFA noted that the RUC process used during the 1997 Five-Year Review was "beneficial" and further states:

> *The RUC's perspective will be helpful because of its experience in recommending relative values for codes that have been added to, or revised by, the CPT Editorial panel since we implemented the physician fee schedule in 1992. Furthermore, the RUC, by virtue of its multi-specialty membership and consultation with approximately 65 specialty societies, involves the medical community in the refinement process. We emphasize, however, as we reiterated for the first Five-Year Review, that we retain the responsibility for analyzing the comments in the 2000 physician fee schedule, developing the proposed rule for 2001, evaluating the comments on the proposed rule, and deciding whether to revise relative value units. We are not delegating this responsibility to the RUC or any other organization.*

CMS received only 30 public comments in response to its solicitation of misvalued codes to be reviewed in the second, Five-Year Review. However, 870 codes were identified for review as several specialties (general surgery, vascular surgery and cardiothoracic surgery) commented that nearly all of the services performed by their specialty were misvalued. The process that the RUC utilized in the 2002 Five-Year Review was very similar to the process utilized in the 1997 Five-Year Review. Multidisciplinary workgroups were utilized to review the large number of codes. The entire RUC then reviewed and discussed the reports of these workgroups.

In October 2000, the RUC submitted recommendations to: increase the work relative values for 469 CPT codes; decrease the work relative values for 27 CPT codes; and maintain the work relative values for 311 CPT codes. As in the 1997 Five-Year Review, the RUC also referred 63 codes to the CPT Editorial Panel to consider coding changes. In addition, the RUC reviewed a comment from the American Society of Anesthesiologists that the anesthesia conversion factor was too low. The RUC was able to review a simulated work relative value for 19 anesthesia services and made specific recommendations related to these codes to CMS. The CMS published a Proposed Rule on June 8, 2001, and a Final Rule on November 1, 2001, announcing the agency's intention to accept and implement more than 95% of the RUC's recommendations on January 1, 2002.

In the November 15, 2004, *Final Rule*, CMS solicited comments from the public on misvalued codes. CMS stated that the Agency would also be identifying codes that they

felt were potentially misvalued. The RUC Five-Year Review Compelling Evidence Standards were published in this *Final Rule* and CMS requested that those commenting consider these standards and reference them in their comment letters. As a result of these two processes, CMS received public comments from 44 specialties in response to its solicitation.

In October 2005, February 2006, March 2007 and May 2007 the RUC submitted recommendations on 751 individual CPT codes to CMS. The RUC has recommended improvements to the work RVUs for numerous services including the Evaluation and Management Services, for both stand alone visits and those performed in the post-operative period of surgical procedures. The RUC submitted recommendations to: increase the work relative values for 285 codes; decrease the relative values for 33 codes and maintain the relative values for 294 codes. The RUC also referred 139 codes to the CPT Editorial Panel to consider coding changes prior to consideration of the work relative value.

The third Five-Year Review specifically included review of 35 evaluation and management services and post-induction period procedure anesthesia (PIPPA) intensity. The RUC agreed that incorrect assumptions were made in the previous valuation of E/M services. The RUC recommended and CMS approved an increase in work RVUs for 28 services and maintained the work RVUs for seven services. Furthermore, the RUC recommended and CMS accepted that the full increase of the E/M service be incorporated into the surgical and global periods for each CPT code with global periods of 010 and 090 days.

The RUC considered the request from CMS to assign PIPPA intensity. In addition, CMS referred to the RUC the question of how and whether to apply the E/M Five-Year Review increases to the pre-and post-work of anesthesia services. Based on the extensive review of a building block approach that could be used to evaluate the work of all anesthesia service components other than the post-induction period and validation of PIPPA, the RUC reached agreement that anesthesia services were undervalued by 32%. CMS accepted this recommendation and increased the work of anesthesia services by 32% on January 1, 2008.

In November 2006, CMS published a Final Rule in the Federal Register announcing the agency's final decision regarding these services. CMS accepted 97% of the RUC's recommendations. The relative value changes were implemented on January 1, 2007.

In 2006, the RUC formed the Five-Year Review Identification Workgroup. The purpose of this workgroup is to identify potentially misvalued services using objective mechanisms for reevaluation during the upcoming Five-Year Review. The Workgroup is also charged with developing and maintaining processes associated with the identification and reconsideration of the value of "new technology" services. The Workgroup was established by the RUC following numerous comments from the Medicare Payment Advisory Commission urging CMS to be more diligent in the identification of both

potentially over- and under- valued services within the payment schedule for review during the Five-Year Reviews.

The Five-Year Review Identification Workgroup continues to identify and review services during the interim of each Five-Year Review. The Workgroup's identification screening process to date has addressed services often billed together; fastest growing procedures; services with shifts in the site-of-service; and services with high intensity, relative to other physician services.

Potential Scope of the 2012 Five-Year Review

The scope of the 2012 Five-Year Review is unknown at this time, as CMS comment period will not be initiated until November 2009. AMA RUC staff asked specialty societies to share their intentions regarding the next five-year review. Forty-one specialties responded to this query. Half of the specialties responded that they do not intend on identifying any codes, the other half indicated that as many as 250 CPT codes could be identified. Therefore, it will be prudent, and realistic, to assume that CMS will receive comments on a fair number of codes and a special process will need to be developed to review these codes. Due to the low number of codes anticipated for review, compared to the previous Five-Year Reviews, an additional special meeting in August 2010, may not be necessary. Instead, the entire Five-Year Review could be accomplished at the September 30 - October 3, 2010, RUC meeting, with the possibility of adding one additional day (September 29).

Final Rule Comment Process

In the past, CMS has announced at least a 60 day comment period for the public to identify any misvalued code for review and clarified that the scope of the review will be limited to the work relative values. The practice expense relative values were fully implemented on January 1, 2002, refined and transitioned 2007-2010 and may be further refined by CMS based on the recent Physician Practice Information (PPI) Survey. The professional liability insurance (PLI) relative values were implemented on January 1, 2000, and will be refined for January 1, 2010. The RUC agrees that the 2010 Five-Year Review should be restricted to the review physician work relative values. While it is expected that certain elements of the direct practice expense inputs will be modified due to changes in physician time and/or number of follow-up visits, the RUC considers any independent review of practice expense to be unnecessary at this time.

In the previous comment processes, CMS has stated that their preferred format for submitting a code for review is to include the following:

- CPT code
- Clinical description of the service
- Discussion of how the work of that service is analogous to one or more reference services

- Additional information for services with global periods:
    - physician time - on the same date as the service
    - whether the patient goes home, to a hospital bed, or to an ICU on the same day
    - number, time, type of physician visits after the day of procedure until the end of the global period (distinguish between outpatient and inpatient visits).
    - CMS requests that commenters provide nationally representative data from operating room logs, reports, or medical charts to explain this post-service time.

The RUC has extensively discussed measures to ensure that each specialty society, contractor medical director, or any member of the general public has equal opportunity to comment on misvalued codes and present their argument in a uniform manner. The RUC has developed compelling evidence standards and proposes that these standards be utilized throughout the process. The RUC recommends that the existing work relative value for a code should be considered to be appropriate unless compelling evidence is provided to convince the RUC that the value is either undervalued or overvalued.

These compelling evidence standards have been reviewed by the specialty societies who participate in the RUC process. The RUC believes that these standards should be reviewed by the contractor medical directors and the public prior to their use in the comment period. Therefore, the RUC requests that CMS publish these standards in the *Proposed Rule* this spring and review comments before publishing final compelling evidence standards in the *Final Rule* in November 2009. The RUC envisions that CMS would specify the format of comment letters to include documentation of compelling evidence. The RUC also requests that CMS review and screen comment letters to make sure that they meet the minimal standards regarding compelling evidence prior to sharing with the RUC for review. The comment letter should include a compelling evidence rationale for each code submitted. The compelling evidence standards developed by the RUC are as follows:

Compelling Evidence Standards
The RUC operates with the initial presumption that the current values assigned to the codes under review are correct. This presumption can be challenged by a society or other organization presenting a compelling argument that the existing values are no longer rational or appropriate for the codes in question. The argument for a change must be substantial and meet the RUC's compelling evidence standards. This argument must be provided in the comment letter to CMS, and then later to the RUC in writing on the Summary of Recommendation form. The following guidelines may be used to develop a "compelling argument" that the published relative value for a service is inappropriately valued:

- Documentation in the peer-reviewed medical literature or other reliable data that there have been changes in physician work due to one or more of the following:

    - technique

- knowledge/technology
- patient population
- site-of-service
- length of hospital stay
- physician time

- An anomalous relationship between the code being valued and other codes. For example, if code A describes a service that requires more work than codes B, C, and D, but is nevertheless valued lower. The specialty would need to assemble evidence on service time, technical skill, patient severity, complexity, length of stay and other factors for the code being considered and the codes to which it is compared. These reference services may be both inter- and intra-specialty.

- Evidence that technology has changed physician work (ie, diffusion of technology).

- Analysis of other data on time and effort measures, such as operating room logs or national and other representative databases.

- Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:

    - a misleading vignette, survey and/or flawed crosswalk assumptions in a previous evaluation;

    - a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values; and/or

    - a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.

Timetable

May 2009	Submission of RUC Proposal on Five-Year Review to CMS
December 30, 2009	Comment period closes on public solicitation of codes to be reviewed. *Assumes publication date of CMS Final Rule of November 1, 2009*
February 1, 2010	CMS staff to send AMA staff list of codes to be reviewed, along with supporting documentation.
February 2010	CMS staff to send AMA staff list of codes to be reviewed, along with supporting documentation.

February 4-7, 2010	Research Subcommittee to review any changes to the existing RUC survey instrument.
February 16, 2010	AMA to send Level of Interest (LOI) forms to all specialty societies and HCPAC organizations. LOI package to include all materials received by CMS.
March 16, 2010	Responses to the LOI due to the AMA.
March 2010	Five-Year Review Workgroup to Review Comment Letters for codes in which there is no interest expressed to determine next steps for the review of these services.
April 28 – May 2, 2010	Summary of codes under review and specialty society assignments Research Subcommittee to review any alternative methodologies introduced.
May 10, 2010	Surveys to be mailed to all specialty societies and HCPAC organizations that have identified an interest in surveying.
August 3, 2010*	Recommendations due to the AMA from specialty societies.
August 26-28, 2010*	Five-year review workgroups meet and review recommendations.
September 13, 2010*	Workgroup recommendations and consent calendars sent to the RUC.
September 30 – October 3, 2010	RUC meeting to review workgroup recommendations and consent calendars
October 31, 2010	RUC recommendations submitted to CMS.
November 2010-February 2011	CMS Review
March 2011	Notice of Proposed Rulemaking (NPRM) on Five-Year Review
November 2011	Final Rule on Five-Year Review
January 1, 2012	Implementation of new work relative value units.

**Dates dependent on volume of codes to be reviewed. May only meet Sept/Oct 2010.*

Process, Work Plan, and Policies

Drawing on the ground rules and policies from the previous five-year reviews, the following proposed process should provide the framework for the 2012 Five-Year Review.

CMS Submission and Level of Interest Process

CMS has shared the comments received within three weeks of receipt in all three previous Five-Year Review processes. Therefore, we would request to receive the comments by February 1, 2010. It would also be preferable to receive the comments and list of codes in a similar format as the previous five-year reviews. This format is illustrated in *attachment A*, and included the following fields:

1. CPT Code
2. Short or Medium CPT Descriptor
3. Control Number - linked the code back to a comment letter where the specific comment was identified.
4. Freq – 2008 frequency of claims for the code
5. Commenter - the specialty society or individual commented on the code (a key was provided to define acronyms).
6. Current RVU - the 2010 work RVU would be included here.
7. Rec RVU - the recommended RVU - or a note that the presenter requested an increase or decrease.
8. 1 Ref Code - Code number for a reference code identified
9. 2 Ref Code - Code number for second reference code identified
10. % Dif. - the percentage difference between the work RVU requested and the current work RVU
11. Impact - difference in work RVU x conversion factor x frequency

The inclusion of this information in the material to the RUC was very important and crucial in the compressed schedule to review these services. The RUC will request that CMS follow this same format.

The specialty societies were extremely responsive in the previous five-year reviews in coordinating the Level of Interest process in a few weeks. The same timeframe will be necessary for this five-year review.

Initial Screen of Codes

In 2006, the RUC formed the Five-Year Review Identification Workgroup. The purpose of this workgroup is to identify potentially misvalued services using objective mechanisms for reevaluation prior to the upcoming Five-Year Review. By February 2010, the Five-Year Review Identification Workgroup's identification screening processes will have addressed services often billed together; fastest growing procedures; services with shifts in the site-of-service; and services with high intensity, relative to other physician

services. Therefore, the RUC believes that additional screens are not necessary for the 2010 Five-Year Review.

Although the RUC agreed that an automated screening process is not necessary for the 2010 Five-Year Review, the RUC is also concerned that codes not be excluded from the review if an interest has not been expressed in reviewing the code(s). Therefore, the Five-Year Review Workgroup will convene following the Level of Interest Process to review any codes for which a specialty society has not indicated an interest in involvement to determine the disposition of these comments.

Surveys and Alternative Methodologies

The Research Subcommittee will review the current RUC survey used to develop work RVU recommendations at the February 2010 RUC meeting to determine if any changes need to be incorporated for the Five-Year Review. During the previous Five-Year Reviews, the survey instrument was substantially improved and used for the new and revised code review process after these Five-Year Reviews were completed. However, there may be relevant questions that should be added to the current survey. Such as in the last Five-Year Review in which the question on how the service has changed in past five years was added.

The Research Subcommittee will also be charged with reviewing any alternative methodologies introduced for this Five-Year Review. At this time, it is not known whether any specialty society will be submitting any such study or request the RUC to review a specialty methodology for their services. However, if this does occur, the Research Subcommittee will be prepared to discuss these issues in April and the RUC will determine the appropriateness of any such study/methodology at their April 2010 meeting. Previously approved methodologies are acceptable and will not require a new review by the Research Subcommittee (eg, mini-survey methodology previously utilized by the Society for Vascular Surgery).

The surveys for the Five-Year Review will be mailed to the specialty societies May 10, 2010. As in the past, specialty societies may, if they choose, share their vignettes with the workgroup who will be reviewing their codes to receive feedback prior to the release of their surveys. Copies of all final survey instruments, including vignettes and cover letters, must be provided to the AMA for filing. The completed summary of recommendation forms will be submitted to the AMA RUC staff by August 3, 2010.

Workgroups

The previous Five-Year Review processes incorporated workgroups to review the recommendations. Eight workgroups were utilized with six RUC members or RUC alternate members on each workgroup. For planning purposes, a similar structure will be implemented in the 2012 Five-Year Review process. The assignment of the workgroup

Chairs, composition, and topics to be addressed will be done prior to the April 2010 RUC meeting. The RUC Chair will assign individuals to these workgroups. The workgroups will meet for organizational purposes at the April RUC meeting and for 1 and 1/2 days in August 2010 to review their assigned codes.

If the volume of codes to review in the 2012 Five-Year Review is low, the workgroups will convene for an extra day as part of the Sept/October meeting in lieu of the August 2010 meeting and pre-facilitate all codes.

It should be noted that for services performed only by non-MDs/DOs, the Health Care Professionals Review Board would meet in April and September 2010 to discuss these issues.

Workgroup Rules and Policies

The attached document, *Procedures for August Workgroup and September/October RUC Meetings* was developed to guide the workgroups and to ensure consistency in the rules used by each workgroup. The Workgroup on the Five-Year Review agrees that principles in this document were appropriate and recommends that an update version of this document be forwarded as instructions for the August 2010 workgroup meetings. A few key points from this document are as follows:

- All specialty societies will have equal opportunity to collect and present data to the Workgroup meetings in August 2010. Specialty societies will not be provided with additional opportunity to collect new data following these meetings.

- Following the presentation of each code or issue, the workgroup members will ask questions of the presenters. Time permitting, other RUC members, specialty society advisors, or staff who are present should also feel free to make comments about the codes. The workgroup on the Five-Year Review also recommends that it be explicitly stated that the entire workgroup process will be open to the presenters, and all other RUC participants who wish to attend, including the decision-making process regarding the codes under review.

For each code, the workgroup should attempt to reach consensus on one of the following actions that it will recommend to the RUC:

1. Adopt the recommended increase in RVUs
2. Maintain the current RVUs
3. Adopt the recommended decrease in RVUs
4. Suggest a new RVU
5. Refer the code to CPT
6. No consensus
7. Accept withdrawal by commenter, without prejudice

The workgroup may want to suggest a new RVU (action #4) if, for example, it agrees with the commenter and/or specialty society that the RVUs should be increased or decreased, but believes that a different key reference service is more equivalent to the service under review than the one initially presented by the commenter or specialty.

For each of the above actions, the workgroup should have a reason for the action it takes. Recommended increases or decreases should only be adopted if compelling evidence has been provided by either the specialty society or those commenting that the current relative values are incorrect. Rationale must also be provided for referrals the CPT Editorial Panel and for decisions to maintain the current relative values. The only situation in which a detailed discussion and rationale may not be necessary is if the specialty society originally recommended a change and now believes that it has not developed sufficient evidence to support the change and agrees that the current RVUs should be maintained.

Any commenter may withdraw their own comments/codes from the Five-Year Review. In this case, the action key will be recorded as action key #7. Only the original commenter may withdraw a comment/code from the Five-Year Review.

In order to report "no consensus" (action #6) to the RUC, the workgroup or individual(s) who are in the minority must offer a rationale for the lack of consensus. If there is a minority opinion (ie, if five workgroup members believe the specialty's recommendation should be adopted and one member does not) that member must offer some rationale for not adopting the recommendation.

An AMA staff member will attend each workgroup's meeting to record the discussion and decisions at the meeting and draft a report from each group to the RUC. These reports will include the nature of the group discussion, the action taken and rationale for it, and other expressed opinions about the action. Workgroup members will have an (brief) opportunity to review and comment on these drafts before they are disseminated to the full RUC.

- Because preliminary review of the materials is so important, no substitutions for attendance by workgroup members at meetings will be permitted.

RUC Review/Consent Calendar Process

At the September 30 - October 3, 2010 RUC meeting, the recommendations from each workgroup will be presented to the RUC in the form of a consent calendar. There will be five consent calendars for each topic within each workgroup, following each of the first five action keys. Codes for which the workgroup does not reach consensus will be listed individually. During the previous Five-Year Review, there were not significant issues concerning the ability to reach consensus within the workgroups.

The workgroups will meet in executive session to discuss the codes to be extracted, any new information on codes for which they could not reach consensus in August and other issues that may arise between the August and September/October meetings.

Appeals Process

Codes on the consent calendar may be extracted by any RUC member or specialty society advisor who disagrees with the workgroup's recommendation or wishes to have the code discussed by the full RUC. If a RUC member extracts a code for further discussion, the workgroup recommended relative value is the value to be voted upon. However, if a specialty society withdraws a code from the consent calendar and presents its recommendation to the full RUC, the specialty society work value should be the value voted upon. As required by the RUC's Structure and Functions document, a vote by two-thirds of the representatives present at the RUC meeting shall constitute passage of each RVS recommendation.

If a facilitation committee is needed for an issue, the issue will be referred to the same facilitation group to which it was originally assigned. This facilitation committee may be augmented with additional individuals at the request of the specialty society, the workgroup, or the RUC chair.

The RUC also has a formal appeals (re-consideration) process included in the RUC's Rules and Procedures document. This formal appeal would occur after the September/October 2010 RUC meeting and any re-consideration would occur at a future RUC meeting. These appeals process is outlined as follows:

II. **Appeals Process for Reconsideration of RUC Recommendations**

A. If a specialty requests an appeal of a RUC recommendation, the Chair will appoint an Ad Hoc Facilitation Committee as in I.F.1. If time permits, the RUC will hold the relevant portion of the final recommendation of the RUC while the reconsideration process continues.

B. The Ad Hoc Facilitation Committee shall meet in person or by telephone conference within two weeks of receipt of a written request for an appeal.

C. All appeals of RUC decisions shall be in writing.

D. The Ad Hoc Facilitation Committee shall invite appellants to meet with the Ad Hoc Facilitation Committee in person or by telephone to discuss the rationale for RUC decisions or to provide written comments.

E. The Ad Hoc Facilitation Committee will notify anyone who previously commented on an issue under appeal and elicit further comments.

F. The Ad Hoc Facilitation Committee shall vote to recommend to the RUC whether the RUC should reconsider its previous recommendation and, if so, shall develop a new recommendation for consideration by the RUC.

G. The Ad Hoc Facilitation Committee shall provide its recommendation to the AMA for distribution to the RUC at least two weeks prior to the next meeting of the RUC and shall communicate to all relevant parties in a timely manner.

H. An appeal request of a RUC recommendation submitted less than two weeks prior to an upcoming RUC meeting will be deferred to the subsequent RUC meeting to permit at least two weeks notice to all parties.

I. In the event the RUC reconsiders an action by this appeal process, the RUC decision will be final.

J. Approval of reconsideration of a vote which required a two-thirds majority shall itself require a two-thirds majority

Submission to CMS

AMA staff will develop detailed recommendations to be submitted to CMS immediately following the September/October 2010 RUC meeting. These recommendations will be circulated to the RUC for comment prior to their submission to CMS in October 2010.

CMS Review of RUC recommendations

The RUC will request to be invited to any Contractor Medical Director or other committee meetings convened by CMS to review the RUC recommendations. The RUC believes that this participation is necessary to clarify any questions that may arise regarding the RUC recommendations. CMS will publish a *Proposed Rule* in spring of 2011 announcing its review of the RUC's recommendations.

93544	Injection procedure during cardiac catheterization; for aortography	CPT						X		
93545	Injection procedure during cardiac catheterization; for selective coronary angiography (injection of radiopaque material may be by hand)	CPT						X	X	
93555	Imaging supervision, interpretation and report for injection procedure(s) during cardiac catheterization; ventricular and/or atrial angiography	CPT						X	X	
93556	Imaging supervision, interpretation and report for injection procedure(s) during cardiac catheterization; pulmonary angiography, aortography, and/or selective coronary angiography including venous bypass grafts and arterial conduits (whether native or use	CPT						X	X	

RUC Recommendations for Existing Codes

CPT Code	Descriptor	RUC Recommendation	Site of Service Screen	High IWPUT	RUC High Volume	CMS Fastest Growing	Shift from PE to Work	Codes Reported Together	CMS Request PE Review	CMS Request Final Rule
93922	Noninvasive physiologic studies of upper or lower extremity arteries, single level, bilateral (eg, ankle/brachial indices, Doppler waveform analysis, volume plethysmography, transcutaneous oxygen tension measurement)	CPT				X				
93923	Noninvasive physiologic studies of upper or lower extremity arteries, multiple levels or with provocative functional maneuvers, complete bilateral study (eg, segmental blood pressure measurements, segmental Doppler waveform analysis, segmental volume plet	CPT				X				
93924	Noninvasive physiologic studies of lower extremity arteries, at rest and following treadmill stress testing, complete bilateral study	CPT				X				
94014	Patient-initiated spirometric recording per 30-day period of time; includes reinforced education, transmission of spirometric tracing, data capture, analysis of transmitted data, periodic recalibration and physician review and interpretation	CMS to review claims			X					
94015	Patient-initiated spirometric recording per 30-day period of time, recording (includes hook-up, reinforced education, data transmission, data capture, trend analysis, and periodic recalibration)	CMS to review claims			X					
94016	Patient-initiated spirometric recording per 30-day period of time; physician review and interpretation only	CMS to review claims			X					
94450	Breathing response to hypoxia (hypoxia response curve)	CMS to review claims			X					
94760	Noninvasive ear or pulse oximetry for oxygen saturation; single determination	New PE inputs							X	
94761	Noninvasive ear or pulse oximetry for oxygen saturation, multiple determinations (eg, during exercise)	New PE inputs							X	
94762	Noninvasive ear or pulse oximetry for oxygen saturation, by continuous overnight monitoring (separate procedure)	New PE inputs				X			X	
94770	Carbon dioxide, expired gas determination	Should be N/A for Non-Facility PE			X					
95803	Actigraphy testing, recording, analysis, interpretation, and report (minimum of 72 hours to 14 consecutive days of recording)	New PE inputs							X	
95922	Testing of autonomic nervous system function, vasomotor adrenergic innervation (sympathetic adrenergic function), including beat-to-beat blood pressure and R-R interval changes during Valsalva maneuver and at least five minutes of passive tilt	CPT			X	X				
95956	Monitoring for localization of cerebral seizure focus by cable or radio, 16 or more channel telemetry, electroencephalographic (EEG) recording and interpretation, each 24 hours	CPT				X				
G0179	Physician re-certification for Medicare-covered home health services under a home health plan of care (patient not present), including contacts with home health agency and review of reports of patient status required by physicians to affirm the initial implementation of the plan of care that meets patient's needs, per re-certification period	CPT				X				
G0180	Physician certification for Medicare-covered home health services under a home health plan of care (patient not present), including contacts with home health agency and review of reports of patient status required by physicians to affirm the initial implementation of the plan of care that meets patient's needs, per certification period	CPT				X

RUC Referrals to CPT Editorial Panel

Code	Screen	RUC Review Date	Specialty	Background	CPT Meeting & Tab
11040	Site of Service Anomaly	September 2007	ACS, AAOS	Descriptor enables a bi-modal typical patient. Additional granularity in descriptor will provide greater clarity and more accurate valuation based on only one typical patient.	Feb 09 Tab 5 resulting in CPT Excision and Debridement Workgroup Formed
11041	Site of Service Anomaly	September 2007	ACS, AAOS	Descriptor enables a bi-modal typical patient. Additional granularity in descriptor will provide greater clarity and more accurate valuation based on only one typical patient.	Feb 09 Tab 5 resulting in CPT Excision and Debridement Workgroup Formed
11042	Site of Service Anomaly	September 2007	ACS, AAOS	Descriptor enables a bi-modal typical patient. Additional granularity in descriptor will provide greater clarity and more accurate valuation based on only one typical patient.	Feb 09 Tab 5 resulting in CPT Excision and Debridement Workgroup Formed
11043	Site of Service Anomaly	September 2007	ACS, AAOS	Descriptor enables a bi-modal typical patient. Additional granularity in descriptor will provide greater clarity and more accurate valuation based on only one typical patient.	Feb 09 Tab 5 resulting in CPT Excision and Debridement Workgroup Formed
11044	Site of Service Anomaly	September 2007	ACS, AAOS	Descriptor enables a bi-modal typical patient. Additional granularity in descriptor will provide greater clarity and more accurate valuation based on only one typical patient.	Feb 09 Tab 5 resulting in CPT Excision and Debridement Workgroup Formed
14300	Site of Service Anomaly / CMS Fastest Growing	October 2008	ACS, AAD, ASPS, AAO-HNS	The specialty society commented that the descriptor does not accurately describe the work that may be involved in this service. Specifically, the work that is involved in performing the procedure in one area of the body may vary greatly from the work that is involved in performing the procedure in other areas of the body. The specialty society recommended and the RUC agreed that the code be referred to the CPT Editorial Panel for revision.	Feb 09 Tab 9 Code Deleted

15740	Site of Service Anomaly / CMS Fastest Growing	April 2008	AAD, ASPS	CPT code 15740 was identified through the RUC's Five Year Review Identification Workgroup as a site of service anomaly in September 2007. After discussion amongst the specialties that provide the service, there was confusion as to how this service, as described, was performed in the office and hospital setting. All societies agreed that this service needed clarification and recommended forwarding the code to CPT to better delineate instructions as to how to code this service properly, and develop a CPT assistant article to assist in coding properly. The society plans to create a code change proposal for introductory language to be published in the CPT, and provide its membership with instructions and clarification in coding as well. The RUC recommends CPT code 15740 be referred to the CPT Editorial Panel for instructional language development to be submitted by July 23, 2008. The physician time will be reverted back to its original physician time components in place prior to the RUC's Five Year Review Identification Workgroup's site of service anomalies activities. Feb 2009, CPT added introductory language to clarify reporting.	Feb 09 Tab 11 Complete
19357	Site of Service Anomaly	April 2009	ASPS	Originally referred to CPT because of differences in delayed and immediate breast reconstruction enables a bi-modal typical patient. Specialty requests RUC reconsider referral. In April 2009 Workgroup reviewed this issue and reaffirmed its original recommendation that this code be referred to CPT. Given its bi-modal distribution, code 19357 may be separated into two separate codes to describe interval and immediate reconstruction.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
20005	Site of Service Anomaly	September 2007	ACS, APMA	Refer to CPT to consider description change to clarify target. The dominant specialties are not consistent because deep abscess is unlikely to be performed in the office	June 09 Tab 15
21015	Site of Service Anomaly	September 2007	ACS, AAOS, AAO-HNS, ASPS	CPT developed new coding structure for soft tissue tumor procedures.	June 08 Tab 06 New code structure complete
21557	Site of Service Anomaly	September 2007	ACS, AAOS	CPT developed new coding structure for soft tissue tumor procedures.	June 08 Tab 06 New code structure complete
21935	Site of Service Anomaly	September 2007	ACS, AAOS	CPT developed new coding structure for soft tissue tumor procedures.	June 08 Tab 06 New code structure complete

22554	Codes Reported Together	February 2008	AANS/CNS, NASS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship. CPT proposal to be submitted by November 5, 2008	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
22849	CMS Fastest Growing	February 2009	AAOS, NASS, AANS	The Workgroup recommends that the specialty develop changes to the CPT instructions and/or parenthetical to limit reporting with other procedures.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
22851	CMS Fastest Growing	October 2008	AAOS, NASS, AANS	The Workgroup agreed that this service was potentially misvalued and asks that either the service be revised at CPT to bundle with the base code or may need to be resurveyed.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
22900	Site of Service Anomaly	September 2007	ACS, AAOS	CPT developed new coding structure for soft tissue tumor procedures.	June 08 Tab 06 New code structure complete
23076	Site of Service Anomaly	September 2007	ACS, AAOS	CPT developed new coding structure for soft tissue tumor procedures.	June 08 Tab 06 New code structure complete
26080	Site of Service Anomaly	February 2008	ASSH, AAOS	A majority of these services are performed in the out-patient hospital setting, though the survey respondents overwhelmingly state that the service is always performed as an in-patient procedure. The only variance among respondents was the length of stay which was estimated to be between one and six days. Based on these differences, the specialty society concluded and the RUC agreed that there is no appropriate typical patient for the code as currently described. The RUC concurred that greater granularity of the CPT descriptor is a more appropriate path.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
27048	Site of Service Anomaly	September 2007	ACS, AAOS	CPT developed new coding structure for soft tissue tumor procedures.	June 08 Tab 06 New code structure complete
27370	High Volume Growth / CMS Fastest Growing	February 2009	AAOS, ACR	These procedures were referred to CPT for possible deletion of 73580 and 27370 and creation of a new code accurately describing the procedure that is being performed, including the radiologic guidance in the procedure codes.	SS will submit coding proposal by July 15 for October 09 CPT Mtg

27615	Site of Service Anomaly	September 2007	ACS, AAOS	CPT developed new coding structure for soft tissue tumor procedures.	June 08 Tab 06 New code structure complete
27619	Site of Service Anomaly	September 2007	ACS, AAOS	CPT developed new coding structure for soft tissue tumor procedures.	June 08 Tab 06 New code structure complete
27640	Site of Service Anomaly	February 2008	AOFAS, AAOS	CPT Editorial Panel addressed in June 2008 by clarifying that 27635 should be used for exostosis excision, leaving 27640 and 27641 with typical patients requiring an inpatient stay	June 08 Tab 07 Complete
27641	Site of Service Anomaly	February 2008	AOFAS, AAOS	CPT Editorial Panel addressed in June 2008 by clarifying that 27635 should be used for exostosis excision, leaving 27640 and 27641 with typical patients requiring an inpatient stay	June 08 Tab 07 Complete
29220	High Volume Growth	April 2008	AAFP	The specialty society was unable to identify any physician that performs this service and recommended to the Workgroup that the service be referred to the CPT Editorial Panel for deletion. The Workgroup accepts the action plan of the specialty society and recommends that 29220 be referred to the CPT Editorial Panel for possible deletion. Specialty society to prepare CPT coding change proposal to delete code.	Oct 08 Tab 10 Code Deleted
33213	CMS Fastest Growing	October 2008	ACC	The RUC discovered that this service was billed 76% of the time with the removal code, despite the fact that 33213 describes an insertion or replacement. The RUC agrees that this is inappropriate and recommends that the service be referred to CPT for revision of the descriptor and/or instructions.	
35470	CMS Fastest Growing	October 2008	ACC, ACR, SIR	The code is part of a component coding structure. It should be reviewed by CPT along with the other services reported together (bundled services). Percutaneous atherectomy and angioplasty will both be reviewed by CPT.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
35471	CMS Fastest Growing			The code is part of a component coding structure. It should be reviewed by CPT along with the other services reported together (bundled services). Percutaneous atherectomy and angioplasty will both be reviewed by CPT.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
35472	CMS Fastest Growing			The code is part of a component coding structure. It should be reviewed by CPT along with the other services reported together (bundled services). Percutaneous atherectomy and angioplasty will both be reviewed by CPT.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting

.35473	CMS Fastest Growing			The code is part of a component coding structure. It should be reviewed by CPT along with the other services reported together (bundled services). Percutaneous atherectomy and angioplasty will both be reviewed by CPT.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
35474	CMS Fastest Growing	October 2008	ACC, ACR, SIR	The code is part of a component coding structure. It should be reviewed by CPT along with the other services reported together (bundled services). Percutaneous atherectomy and angioplasty will both be reviewed by CPT.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
35475	CMS Fastest Growing			The code is part of a component coding structure. It should be reviewed by CPT along with the other services reported together (bundled services). Percutaneous atherectomy and angioplasty will both be reviewed by CPT.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
35476	CMS Fastest Growing			The code is part of a component coding structure. It should be reviewed by CPT along with the other services reported together (bundled services). Percutaneous atherectomy and angioplasty will both be reviewed by CPT.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
35490	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 – Postponed to Oct 09 CPT Mtg
35491	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 – Postponed to Oct 09 CPT Mtg
35492	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 – Postponed to Oct 09 CPT Mtg
35493	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 – Postponed to Oct 09 CPT Mtg
35494	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 – Postponed to Oct 09 CPT Mtg
35495	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 – Postponed to Oct 09 CPT Mtg

36145	Codes Reported Together	February 2008	ACR	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - proposal by Nov 2008. Code was deleted and replaced with new codes to report arteriovenous shunt access imaging coming to April 2009 RUC meeting under arteriovenous shunt imaging tab.	Feb 09 Tab 31 Code Deleted
36248	CMS Fastest Growing	October 2008	ACR, SIR	The code is part of a component coding structure. It should be reviewed by CPT along with the other services reported together (bundled services)	SS to develop coding proposal by July 15 for Oct 09 CPT mtg
36834	Site of Service Anomaly	September 2007	SVS, ACS	The RUC referred the service to CPT for clarification of the "plastic repair" language within the descriptor	Feb 09 Tab 18 Code Deleted
37760	Site of Service Anomaly	September 2007	SVS, ACS	The RUC referred the service to CPT for clarification of the descriptor and asked the specialty to consider creation of code for minor perforator ligation	Feb 09 Tab 19 Complete
45170	Site of Service Anomaly	February 2008	ACS, ASCRS, ASGS	CPT code 45170 Excision of rectal tumor, transanal approach was identified by the RUC's Five-Year Review Identification Workgroup as a site of service anomaly utilizing information from the current physician time data and the Medicare claims data. The physician time data for this code currently includes hospital visits and discharge management services, however, the Medicare claims data indicate that the service is typically performed in an outpatient setting. CMS agreed with the RUC that this service should be evaluated. The specialty society requested that this service be referred to the CPT Editorial Panel to distinguish the size of the tumor as the removal of different size tumors would reflect different patient populations and different physician work. Further the descriptor should be clarified to indicate that this service represents a full thickness excision of the rectal wall which can result in several patient complications including pelvic sepsis, urinary retention, hemorrhage and rectal/vaginal fistulas. For these reasons, the RUC recommends that 45170 be referred to the CPT Editorial Panel.	Oct 08 Tab 18 Code Deleted
47490	CMS Fastest Growing	February 2009	ACR	This service was referred to CPT to include a code to include guidance. The number of hospital visits varies widely among physicians (i.e., who is managing post-operative care) and it would be more appropriate to change this service to a 000 day global procedure. The Workgroup recommends that it be valued as a 000 day global procedure.	June 09 Tab 17

49420	Site of Service Anomaly	April 2008	ACS	At the April 2008 RUC meeting, the specialty society requested that codes 49420 and 49421 be referred to the CPT Editorial Panel for clarification. The specialty society is concerned that the original intention of these descriptors has changed over time because of the addition of new catheter codes. Additionally, the specialty society indicated that some inadvertent miscoding may be occurring because the descriptor is vague with respect to catheter placement for "drainage" and whether the code is meant for open or percutaneous placement. The RUC recommends that codes 49420 and 49421 be referred to the CPT Editorial Panel for clarification.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
49421	Site of Service Anomaly	April 2008	ACS	At the April 2008 RUC meeting, the specialty society requested that codes 49420 and 49421 be referred to the CPT Editorial Panel for clarification. The specialty society is concerned that the original intention of these descriptors has changed over time because of the addition of new catheter codes. Additionally, the specialty society indicated that some inadvertent miscoding may be occurring because the descriptor is vague with respect to catheter placement for "drainage" and whether the code is meant for open or percutaneous placement. The RUC recommends that codes 49420 and 49421 be referred to the CPT Editorial Panel for clarification.	SS will submit coding proposal by July 15 for Oct 09 CPT Meeting
51726	Codes Reported Together	February 2008	AUA	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - proposal by Nov 2008. Deleted 51772 and 51795, revised 51797 and added three new codes to combine the services.	Feb 09 Tab 24 Complete
51772	Codes Reported Together / CMS Fastest Growing	February 2008	AUA	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - proposal by Nov 2008. Deleted 51772 and 51795, revised 51797 and added three new codes to combine the services.	Feb 09 Tab 24 Code Deleted
51795	Codes Reported Together	February 2008	AUA	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - proposal by Nov 2008. Deleted 51772 and 51795, revised 51797 and added three new codes to combine the services.	Feb 09 Tab 24 Code Deleted
51797	Codes Reported Together	February 2008	AUA	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - proposal by Nov 2008. Deleted 51772 and 51795, revised 51797 and added three new codes to combine the services.	Feb 09 Tab 24 Code Revised

55866	New Technology / CMS Fastest Growing	February 2008	AUA	The specialty society reported that it will submit coding change proposals to the CPT Editorial Panel to request new CPT codes. Code 55866 Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing will remain. Additional CPT coding change proposals will be submitted for the following: 5586X *Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing; with total pelvic lymphadenectomy* and 5586X *Laparoscopy, robotic assisted surgical prostatectomy, retropubic radical, including nerve sparing*, and 5586X, *with total pelvic lymphadenectomy*, in time for discussion at the February 2009 CPT Editorial Panel Meeting. In February 2008 the Five-Year Review Identification Workgroup recommended that the specialty society develop a coding proposal to separate code 55866 into two codes to distinguish between robotic and non-robotic laparoscopic prostatectomy. The CPT Editorial Panel determined that the codes should be surveyed and describe the typical method and not separated into two codes. The Workgroup recommends that 55866 be reviewed at the October 2009 RUC meeting. The Workgroup indicated that it is at the discretion of the society if they wish to revise the vignette and resurvey 55866 or utilize survey data from last year.	RUC review Oct 09
57155	Site of Service Anomaly	September 2007	ACOG, ASTRO	ACOG conducted original survey however, service is performed by radiation oncologists 83% if the time. The typical patient may have changed requiring modification to the descriptor	SS will submit coding proposal by July 15 for October 09 CPT Mtg
61795	CMS Fastest Growing	February 2009	NASS, AAO-HNS, AANS	The specialty commented that the descriptor does not accurately describe the work and recommends that the service be referred to CPT to create several more granular codes. The Workgroup agreed and recommends that the service be referred to CPT.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
61885	Site of Service Anomaly	February 2009	AANS/CNS	The RUC approved the specialty society recommendation to refer to CPT	SS will submit coding proposal by July 15 for October 09 CPT Mtg
63056	CMS Fastest Growing	February 2009	NASS, AANS	The specialty noted that the increase in utilization may be due to some inappropriate reporting of procedures that should be described using 62287 and another procedure that does not have a CPT code. The Workgroup recommends referral to CPT for changes to the instructions and possible creation of a new CPT code.	SS will submit coding proposal by July 15 for October 09 CPT Mtg

63075	Codes Reported Together	February 2008	AANS/CNS, NASS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship. CPT proposal to be submitted by November 5, 2008	SS will submit coding proposal by July 15 for October 09 CPT Mtg
63660	Site of Service Anomaly / CMS Fastest Growing	February 2008	AAPM, AANS/CNS, ASA, ISIS, NASS	The RUC recommend that this code be referred to the CPT Editorial Panel to more clearly define the service as the current CPT descriptor makes this code difficult to survey and value, i.e. the descriptor includes remove or revise.	Oct 08 Tab 19 Code Deleted
64416	Site of Service Anomaly	September 2007	ASA	The RUC recommended change to 000 global for accuracy & consistency of valuation; change in descriptor is necessary as it implies a different global. Change in descriptors & globals for entire family is necessary for uniformity and accuracy.	Feb 08 Tab 31 Complete
64446	Site of Service Anomaly / High Volume Growth	September 2007	ASA	The RUC recommended change to 000 global for accuracy & consistency of valuation; change in descriptor is necessary as it implies a different global. Change in descriptors & globals for entire family is necessary for uniformity and accuracy.	Feb 08 Tab 31 Complete
64448	Site of Service Anomaly / High Volume Growth / CMS Fastest Growing	September 2007	ASA	The RUC recommended change to 000 global for accuracy & consistency of valuation; change in descriptor is necessary as it implies a different global. Change in descriptors & globals for entire family is necessary for uniformity and accuracy.	Feb 08 Tab 31 Complete
64449	Site of Service Anomaly	September 2007	ASA	The RUC recommended change to 000 global for accuracy & consistency of valuation; change in descriptor is necessary as it implies a different global. Change in descriptors & globals for entire family is necessary for uniformity and accuracy.	Feb 08 Tab 31 Complete
64470	High Volume Growth	April 2008	ASA, NASS, AAPM, ISIS	The RUC recommended that the specialty develop a coding change proposal to include work that was once a part of the add-on service but is now typically performed with the base code within the base code.	Feb 09 Tab 28 Code Deleted
64472	High Volume Growth	April 2008	ASA, NASS, AAPM, ISIS	The RUC recommended that the specialty develop a coding change proposal to include work that was once a part of the add-on service but is now typically performed with the base code within the base code.	Feb 09 Tab 28 Code Deleted
64475	High Volume Growth	April 2008	ASA, NASS, AAPM, ISIS	The RUC recommended that the specialty develop a coding change proposal to include work that was once a part of the add-on service but is now typically performed with the base code within the base code.	Feb 09 Tab 28 Code Deleted
64476	High Volume Growth	April 2008	ASA, NASS, AAPM, ISIS	The RUC recommended that the specialty develop a coding change proposal to include work that was once a part of the add-on service but is now typically performed with the base code within the base code.	Feb 08 Tab 28 Code Deleted

64483	CMS Fastest Growing	October 2008	AAPM, ISIS, ASA, NASS, AAPMR	The RUC recommended that this service along with the other codes in its family (64470, 64472, 64475, 64476, 64479, 64480, 64483, 64484) be referred to CPT to be bundled with the appropriate guidance procedure(s).	June 09 Tab 19
64484	CMS Fastest Growing	October 2008	AAPM, ISIS, ASA, NASS, AAPMR	The Workgroup recommended that this service along with the other codes in its family (64470, 64472, 64475, 64476, 64479, 64480, 64483, 64484) be referred to CPT to be bundled with the appropriate guidance procedure(s).	June 09 Tab 19
64573	Site of Service Anomaly	February 2009	AANS/CNS	RUC approved the specialty society recommendation to refer to CPT.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
64581	Site of Service Anomaly	April 2008	AUA	Specialty to develop coding change proposal	SS will submit coding proposal by July 15 for Oct 09 CPT Mtg
64622	High Volume Growth / CMS Fastest Growing	April 2008	ASA, NASS, AAPM, ISIS	CPT Executive Committee addressed on May 1 and added parenthetical to instruct use of unlisted code for pulsed radiofrequency.	May 08 EC- B Complete
64623	High Volume Growth	April 2008	ASA, NASS, AAPM, ISIS	CPT Executive Committee addressed on May 1 and added parenthetical to instruct use of unlisted code for pulsed radiofrequency.	May 08 EC- B Complete
64626	High Volume Growth / CMS Fastest Growing	April 2008	ASA, NASS, AAPM, ISIS	CPT Executive Committee addressed on May 1 and added parenthetical to instruct use of unlisted code for pulsed radiofrequency.	May 08 EC- B Complete
64627	High Volume Growth / CMS Fastest Growing	April 2008	ASA, NASS, AAPM, ISIS	CPT Executive Committee addressed on May 1 and added parenthetical to instruct use of unlisted code for pulsed radiofrequency.	May 08 EC- B Complete
64712	Site of Service Anomaly	April 2008	AOFAS, ASSH, AAOS, ASPS	The specialty society has identified this as a CPT issue requiring new codes for catheter injection, not only of the sciatic nerve, but also of the lumbar plexus (ie, code 64714) which also appears to have the same shift in reporting since the introduction of the Racz catheter. The RUC agreed and recommended that this service be referred to the CPT Editorial Panel for revision.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
66761	High IWPUT	April 2009	ASCRS (cataract), AAO	In April 2009 the Workgroup determined that the specialty society should clarify and re-requet that CMS change 66761 to a 010-day global period. However, if the global period change is not acceptable, the specialty society should develop a coding proposal to clarify.	
67210	High IWPUT	April 2008	AAO	Specialty to develop coding change proposal. Thereafter, RUC will request CMS to change global to 010 and subsequent survey	5 Year ID Workgroup Item – Oct 09

67220	High IWPUT	April 2008	AAO	Specialty to develop coding change proposal. Thereafter, RUC will request CMS to change global to 010 and subsequent survey	5 Year ID Workgroup Item – Oct 09
67228	High IWPUT	April 2008	AAO	Specialty to develop coding change proposal. Thereafter, RUC will request CMS to change global to 010 and subsequent survey	5 Year ID Workgroup Item – Oct 09
72192	CMS Fastest Growing	October 2008	ACR	The specialty society indicated that this service is included within the specialties review of Bundled services. The RUC agreed and recommends that the service be addressed through a revision of the CPT code.	June 09 Tab 38
72194	Codes Reported Together / CMS Fastest Growing	February 2008	ACR	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship. CPT proposal to be submitted by November 5, 2008	June 09 Tab 38
73580	High Volume Growth / CMS Fastest Growing	February 2009	AAOS, ACR	These procedures were referred to CPT for possible deletion of 73580 and 27370 and creation of a new code accurately describing the procedure that is being performed, including the radiologic guidance in the procedure codes.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
74170	Codes Reported Together	February 2008	ACR	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship. CPT proposal to be submitted by November 5, 2008	June 09 Tab 38
74175	CMS Fastest Growing	October 2008	ACR	RUC requested that it be reviewed by CPT to consider the appropriateness of component coding and other services it may be typically performed with.	June 09 Tab 38
75790	Codes Reported Together	February 2008	ACR	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship. CPT proposal to be submitted by November 5, 2008	Feb 09 Tab 31 Code Deleted
75992	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 - Postponed to Oct 09 CPT Mtg
75993	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 - Postponed to Oct 09 CPT Mtg

75994	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 - Postponed to Oct 09 CPT Mtg
75995	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 - Postponed to Oct 09 CPT Mtg
75996	High Volume Growth	April 2008	SIR, ACR, SVS	The RUC recommended that a CPT coding change proposal be developed to address the changing technology, which accounts for some of the growth in volume	Feb 09 Tab 17 - Postponed to Oct 09 CPT Mtg
76513	High Volume Growth	April 2008	AAO, ASCatRS	CPT Executive Committee addressed on May 1 and added parenthetical to instruct not to report 76513 where 0187T is appropriate. Specialty to develop CPT Assistant article. The specialty has requested to re-emphasize this issue.	May 08 EC- F Complete
77427	Site of Service Anomalies	October 2008	ASTRO	The RUC Research Subcommittee discussed the development of a modified survey instrument for this service and commented that the coding structure of 77427 does not adequately reflect the practice of this service and that perhaps the code needs to return to the CPT Editorial Panel to address the perceived different levels of intensity of providing this service. The specialty agreed and will bring forward a coding change proposal in March 2009 for the June 2009 CPT Meeting	June 09 Tab 21
77782	High Volume Growth / CMS Fastest Growing	February 2008	ASTRO	Deleted from CPT at February 2008 CPT Editorial Panel Meeting	Feb 08 Tab 36 Code Deleted
78465	Codes Reported Together	February 2008	SNM/ACR/AAC/ASNC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - Type A codes are bi-directionally paired. That is, when Code 1 is reported, Code 2 is also reported greater than the threshold % of occurrences and when Code 2 is reported, Code 1 is also reported greater than the threshold % of occurrences. Subsequently, these two codes are submitted independently "rarely". Foremost, the workgroup will ask specialties to consider coding change proposals to condense each Type A code pair into a single code and eliminate the original two codes.	Oct 08 Tab 23 Code Deleted

78478	Codes Reported Together	February 2008	SNM/ACR/ACC/ASNC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - Type A codes are bi-directionally paired. That is, when Code 1 is reported, Code 2 is also reported greater than the threshold % of occurrences and when Code 2 is reported, Code 1 is also reported greater than the threshold % of occurrences. Subsequently, these two codes are submitted independently "rarely". Foremost, the workgroup will ask specialties to consider coding change proposals to condense each Type A code pair into a single code and eliminate the original two codes.	Oct 08 Tab 23 Code Deleted
78480	Codes Reported Together	February 2008	SNM/ACR/ACC/ASNC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - Type A codes are bi-directionally paired. That is, when Code 1 is reported, Code 2 is also reported greater than the threshold % of occurrences and when Code 2 is reported, Code 1 is also reported greater than the threshold % of occurrences. Subsequently, these two codes are submitted independently "rarely". Foremost, the workgroup will ask specialties to consider coding change proposals to condense each Type A code pair into a single code and eliminate the original two codes.	Oct 08 Tab 23 Code Deleted
78483	High Volume Growth	February 2008	SNM/ACR/ACC/ASNC	Referral to CPT for deletion, clarification, or revision and to explore the possibility of increased use caused by billing this service in conjunction with CPT 78465.	Oct 08 Tab 23 Code Deleted
92541	Codes Reported Together	February 2008	AAO-HNS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - code pair is reported together greater than 95% in a bi-directional relationship.	Feb 09 Tab 54 Complete
92542	Codes Reported Together	February 2008	AAO-HNS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship.	Feb 09 Tab 54 Complete
92544	Codes Reported Together	February 2008	AAO-HNS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - code pair is reported together greater than 95% in a bi-directional relationship.	Feb 09 Tab 54 Complete
92545	Codes Reported Together	February 2008	AAO-HNS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - code pair is reported together greater than 95% in a bi-directional relationship.	Feb 09 Tab 54 Complete

92557	Codes Reported Together	February 2008	AAO-HNS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship.	Feb 09 Tab 54 Complete
92567	Codes Reported Together	February 2008	AAO-HNS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship.	Feb 09 Tab 54 Complete
92568	Codes Reported Together	February 2008	AAO-HNS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship.	Feb 09 Tab 54 Complete
92569	Codes Reported Together	February 2008	AAO-HNS	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship.	Feb 09 Tab 54 Code Deleted
92587	CMS Fastest Growing		AAO-HNS	The specialty noted that this is now a very useful test for a wider range of patients. Previously, these patients were diagnosed via MRI, whereas this service is less expensive. The Workgroup recommends that this service be referred to CPT and subsequently surveyed for physician work and practice expense be reviewed.	June 09 Tab 27
93236	High Volume Growth	February 2008	ACC	In February 2008 the Workgroup recommended referral to CPT for deletion, clarification, or revision. This may also include the development of a CPT Assistant article or review of the impact of previous CPT Assistant articles on volume. In April 2009, the Workgroup recommended that code 93236 be removed from the high volume growth screen as it is carrier priced and does not have work or practice expense RVUs.	Removed from screen
93510	Codes Reported Together	February 2008	ACC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - code pair is reported together greater than 95% in a bi-directional relationship. Specialty is to submit CPT proposal by March 4 2009 for the June 2009 CPT meeting.	June 09 Tab 28
93526	Codes Reported Together	February 2008	ACC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship. Specialty is to submit CPT proposal by March 4 2009 for the June 2009 CPT meeting.	June 09 Tab 28

93539	Codes Reported Together	February 2008	ACC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship. Specialty is to submit CPT proposal by March 4 2009 for the June 2009 CPT meeting.	June 09 Tab 28
93540	Codes Reported Together	February 2008	ACC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship. Specialty is to submit CPT proposal by March 4 2009 for the June 2009 CPT meeting.	June 09 Tab 28
93543	Codes Reported Together	February 2008	ACC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - code pair is reported together greater than 95% in a bi-directional relationship. Specialty is to submit CPT proposal by March 4 2009 for the June 2009 CPT meeting.	June 09 Tab 28
93544	Codes Reported Together	February 2008	ACC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type B code - code pair is reported together greater than 95% in a unidirectional relationship. Specialty is to submit CPT proposal by March 4 2009 for the June 2009 CPT meeting.	June 09 Tab 28
93545	Codes Reported Together	February 2008	ACC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - code pair is reported together greater than 95% in a bi-directional relationship. Specialty is to submit CPT proposal by March 4 2009 for the June 2009 CPT meeting.	June 09 Tab 28
93555	Codes Reported Together	February 2008	ACC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - code pair is reported together greater than 95% in a bi-directional relationship. Specialty is to submit CPT proposal by March 4 2009 for the June 2009 CPT meeting.	June 09 Tab 28
93556	Codes Reported Together	February 2008	ACC	Referred to the CPT Editorial Panel for development of coding change proposals to condense pairs into a single code and create new coding structures. Type A code - code pair is reported together greater than 95% in a bi-directional relationship. Specialty is to submit CPT proposal by March 4 2009 for the June 2009 CPT meeting.	June 09 Tab 28

93922	CMS Fastest Growing	February 2009	ACC, APMA	The Workgroup accepted the specialty recommendation to refer these services to CPT as there are a number of examples included in the code descriptor. The entire family of services (93922, 93923, 93924) are recommended to be referred to CPT.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
93923	CMS Fastest Growing	February 2009	ACC, APMA	The Workgroup accepted the specialty recommendation to refer these services to CPT as there are a number of examples included in the code descriptor. The entire family of services (93922, 93923, 93924) are recommended to be referred to CPT.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
93924	CMS Fastest Growing	February 2009	ACC, APMA	The Workgroup accepted the specialty recommendation to refer these services to CPT as there are a number of examples included in the code descriptor. The entire family of services (93922, 93923, 93924) are recommended to be referred to CPT.	SS will submit coding proposal by July 15 for October 09 CPT Mtg
G0179	CMS Fastest Growing	October 2008	AAFP, ACP, AAHCP	The Workgroup agreed that this service would be more appropriately reported with a CPT Category I code.	ACP discussing with CMS
G0180	CMS Fastest Growing	October 2008	AAFP, ACP, AAHCP	G0180 was identified as part of the code family to be reviewed with G0179. The Workgroup agreed that this service would be more appropriately reported with a CPT Category I code.	ACP discussing with CMS

RUC Recommendations to Develop CPT Assistant Articles

Code	Descriptor	Screen	Date	Recommendation	Specialty	Background	CPT Asst Status
13120	Repair, complex, scalp, arms, and/or legs; 1.1 cm to 2.5 cm	CMS Fastest Growing	Apr-09	Review September 2011	AAD	The Workgroup believed that 13120, 13121, and 13122 were regularly performed at the same time as excision of lesion services and may need to be referred to CPT to create bundled services. However, the specialty society provided a robust analysis of utilization data showing that this family of codes is not typically reported by the same physician at the time of any excision codes. The Workgroup recommends that this service be reviewed again in 2 years. The Workgroup recommends that the specialty develop a CPT Assistant article to provide correct coding instructions. Prior to this identification screen, SS submitted a CPT Assistant article on this issue in Aug 2006. In April 2009 the RUC reviewed the 2006 article and determined that it did not sufficiently address the current issue or have any impact on Medicare utilization. **The Workgroup recommends that another CPT Assistant article be written to address this issue, specifically focusing on the second and higher volume code.**	
13121	Repair, complex, scalp, arms, and/or legs; 2.6 cm to 7.5 cm	CMS Fastest Growing	Apr-09	Review September 2011	AAD	The Workgroup believed that 13120, 13121, and 13122 were regularly performed at the same time as excision of lesion services and may need to be referred to CPT to create bundled services. However, the specialty society provided a robust analysis of utilization data showing that this family of codes is not typically reported by the same physician at the time of any excision codes. The Workgroup recommends that this service be reviewed again in 2 years. The Workgroup recommends that the specialty develop a CPT Assistant article to provide correct coding instructions.	

Code	Descriptor	Screen	Date	Recommendation	Specialty	Background	CPT Asst Status
						Prior to this identification screen, SS submitted a CPT Assistant article on this issue in Aug 2006. In April 2009 the RUC reviewed the 2006 article and determined that it did not sufficiently address the current issue or have any impact on Medicare utilization. **The Workgroup recommends that another CPT Assistant article be written to address this issue, specifically focusing on the second and higher volume code.**	
13122	Repair, complex, scalp, arms, and/or legs; each additional 5 cm or less (List separately in addition to code for primary procedure)	CMS Fastest Growing	Apr-09	Review September 2011	AAD	The Workgroup believed that 13120, 13121, and 13122 were regularly performed at the same time as excision of lesion services and may need to be referred to CPT to create bundled services. However, the specialty society provided a robust analysis of utilization data showing that this family of codes is not typically reported by the same physician at the time of any excision codes. The Workgroup recommends that this service be reviewed again in 2 years. The Workgroup recommends that the specialty develop a CPT Assistant article to provide correct coding instructions. Prior to this identification screen, SS submitted a CPT Assistant article on this issue in Aug 2006. In April 2009 the RUC reviewed the 2006 article and determined that it did not sufficiently address the current issue or have any impact on Medicare utilization. **The Workgroup recommends that another CPT Assistant article be written to address this issue, specifically focusing on the second and higher volume code.**	
20005	Incision of soft tissue abscess (eg, secondary to osteomyelitis); deep or complicated	Site of Service Anomalies	Sep-07	Refer to CPT	ACS, APMA	Refer to CPT to consider description change to clarify target - dominant specialty followed closely by podiatry does not make sense because deep abscess is unlikely to be done in office; Request CPT Assistant to publish an article on correct coding. The specialty commented that they believe the Medicare database, which indicates that	SS submitted coding proposal for review at CPT June 09 meeting

Code	Descriptor	Screen	Date	Recommendation	Specialty	Background	CPT Asst Status
						podiatrists represent 23% of the providers is not reflective of the general population requiring this service and incorrectly reduces this service to slightly below 50% inpatient. They believe the typical patient is staying in the facility and the discrepancy in site-of-service data is caused by normal statistical variation and/or incorrect claim forms.	
22533	Arthrodesis, lateral extracavitary technique, including minimal discectomy to prepare interspace (other than for decompression); lumbar	CMS Fastest Growing	Oct-08	CPT Asst Article	AAOS, NASS, AANS	The Workgroup accepted the specialty society's rationale for the growth in volume and agreed with the recommendation to draft a CPT Assistant article. The article should include the other services in the family, 22532 and 22534.	SS to submit article to CPT by June 2009
29220	Strapping; low back	High Volume Growth	Apr-08	Refer to CPT	AAFP	Specialty society to prepare CPT coding change proposal to delete code. This code change proposal is under consideration at the October 2008 CPT Meeting. The specialty should consider the impact of the April 2002 CPT Assistant on the utilization of this service.	Deleted at Oct 2008 CPT meeting – no further action necessary.
36516	Therapeutic apheresis; with extracorporeal selective adsorption or selective filtration and plasma reinfusion	CMS Fastest Growing	Oct-08	CPT Asst Article	ACP, ASH	The Workgroup noted that this was a new service in 2002 and has relatively low volume. The Workgroup agreed with the specialty society and recommends development of a CPT Assistant article to clarify coding.	Submitted CPT Assistant article Mar 25, 2009 To be published in August 2009
43236	Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed submucosal injection(s), any substance	CMS Fastest Growing	Oct-08	Review September 2011	ACG, AGA, ASGE	Develop CPT Assistant article and look at volume again in 3 years	April 2009
43242	Upper gastrointestinal endoscopy, simple primary examination (eg, with small diameter flexible endoscope) (separate procedure)	CMS Fastest Growing	Oct-08	Review September 2011	ACG, AGA, ASGE	The Workgroup agreed with the specialty society and recommends development of a CPT Assistant article. Further, the Workgroup noted that utilization should be reviewed again in three years to assess the effectiveness of the article.	March 2009

Code	Descriptor	Screen	Date	Recommendation	Specialty	Background	CPT Asst Status
43259	Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with endoscopic ultrasound examination, including the esophagus, stomach, and either the duodenum and/or jejunum as appropriate	CMS Fastest Growing	Oct-08	Review September 2011	ACG, AGA, ASGE	The Workgroup agreed with the specialty society and recommends development of a CPT Assistant article. Further, the Workgroup noted that utilization should be reviewed again in three years to assess the effectiveness of the article.	March 2009
45381	Colonoscopy, flexible, proximal to splenic flexure; with directed submucosal injection(s), any substance	CMS Fastest Growing	Oct-08	Review September 2011	ACG, AGA, ASGE	The Workgroup agreed with the specialty society's rationale for volume growth and recommended that a CPT Assistant article be drafted to discuss the gastroenterology services. Further, the Workgroup noted that utilization should be reviewed again in three years to assess the effectiveness of the article.	March 2009
50605	Ureterotomy for insertion of indwelling stent, all types	CMS Fastest Growing	Oct-08	Refer to CPT	AUA	Urologists are not typically the primary physician and are not performing the opening or closing, and descriptor of physician work should reflect this.	Date of Article received 4-8-09 To be published in July 2009
52214	Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands	High Volume Growth	Oct-08	Review September 2011	AUA	In April 2008, RUC recommends CPT Assistant article; review again in 2 years; and review for PE	Submitted CPT Assistant article Apr 8, 2009 To be published in September 2009
52224	Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) or treatment of MINOR (less than 0.5 cm) lesion(s) with or without biopsy	High Volume Growth	Oct-08	Review September 2011	AUA	In April 2008, RUC recommends CPT Assistant article; review again in 2 years; and review for PE	Submitted CPT Assistant article Apr 8, 2009 To be published in September 2009
64555	Percutaneous implantation of neurostimulator electrodes; peripheral nerve (excludes sacral nerve)	High Volume Growth / CMS Fastest Growing	Feb-08	Refer to CPT, Review in September 2011	ISIS, AAPMR, AANS, AUA	Develop CPT Assistant article and/or review of the impact of previous CPT Assistant articles on volume.	Submitted CPT Assistant article Apr 8, 2009 To be published in October 2009

Code	Descriptor	Screen	Date	Recommendation	Specialty	Background	CPT Asst Status
65780	Ocular surface reconstruction; amniotic membrane transplantation	CMS Fastest Growing	Oct-08	CPT Asst Article	AAO, ASCRS	The Workgroup agreed with the specialty society recommendation to draft a CPT Assistant article to clarify correct reporting.	June 2009
66982	Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage	High IWPUT / CMS Fastest Growing	Apr-08	Reduce to 2x99213 and 3x99212; Review in September 2011	AAO, ASCRS (cataract), AOA (optometry)	Post-service office visits less intense than surveyed (5x99213). Reduce to 2x99213 & 3x99212 to reduce disparate IWPUT between 66982 and 66984. Specialty society work with CMS to develop better defined criteria for accurate reporting of 66982, including a CPT Assistant article. The specialty should also review the 2003 CPT Assistant article to determine if this clarification impacted the reporting of this service.	CPT Staff and SS working on article to be published on Sep 2009
71275	Computed tomographic angiography, chest (noncoronary), with contrast material(s), including noncontrast images, if performed, and image postprocessing	CMS Fastest Growing	Feb-09	Review September 2011	ACR	ACR indicated that some of the utilization growth replaces other services (e.g., 78585). Also, some of the growth may be due to miscoding of coronary CTA studies and development of Category III codes in 2008 should eliminate this coding. Further, the procedure was recently reviewed by the RUC in 2001. The Workgroup recommends that the specialty draft an informational article in CPT Assistant article and a comparable ACR publication and review the service again in 2 years (September 2011).	Submitted CPT Assistant article mar 20, 2009. To be published June 2009.
73218	Magnetic resonance (eg, proton) imaging, upper extremity, other than joint; without contrast material(s)	CMS Fastest Growing	Feb-09	Review September 2011	ACR, ACRh	The specialties commented that the increase in utilization is most likely due to inappropriate coding. Rheumatologists have been reporting this service incorrectly and should instead use 73221. The Workgroup recommends that ACRh publish an article within their coding publication and draft a CPT Assistant Q&A. The Workgroup also recommends that it review this service as well as 73221 again in two years (September 2011).	Submitted CPT Assistant article Apr 21, 2009. Additional ACR input needed.

Code	Descriptor	Screen	Date	Recommendation	Specialty	Background	CPT Asst Status
76513	Ophthalmic ultrasound, diagnostic; anterior segment ultrasound, immersion (water bath) B-scan or high resolution biomicroscopy	High Volume Growth	Apr-08	Refer to CPT	AAO, ASCRS (cataract)	CPT Executive Committee addressed on May 1 and added parenthetical to instruct not to report 76513 where 0187T is appropriate. Specialty to develop CPT Assistant article.	Parenthetical addressed and specialty requested CPT Assistant to reemphasize issue
77301	Intensity modulated radiotherapy plan, including dose-volume histograms for target and critical structure partial tolerance specifications	CMS Fastest Growing	Oct-08	Review September 2011	ASTRO	Develop CPT Assistant article and look at volume again in 3 years	Submitted draft of article March 20, 2009 To be published in August 2009
77418	Intensity modulated treatment delivery, single or multiple fields/arcs, via narrow spatially and temporally modulated beams, binary, dynamic MLC, per treatment session	CMS Fastest Growing	Oct-08	Review September 2011	ASTRO	Develop CPT Assistant article and look at volume again in 3 years	Submitted draft of article March 20, 2009 To be published in August 2009
92270	Electro-oculography with interpretation and report	High Volume Growth	Feb-08	Refer to CPT	AAO, AOA (opt)	Specialty to develop CPT Assistant article to clarify appropriate coding.	Article published in August 2008 CPT Assistant. Additional Q&A to be published June 2009. To be published in June 2009
93236	Electrocardiographic monitoring for 24 hours by continuous computerized monitoring and non-continuous recording, and real-time data analysis utilizing a device capable of producing intermittent full-sized waveform tracings, possibly patient activated, monitoring and real-time data analysis with report	High Volume Growth	Apr-09	Refer to CPT. Review in 2 years. Remove from screen	ACC	Referral to CPT for deletion, clarification, or revision. This may also include the development of a CPT Assistant article or review of the impact of previous CPT Assistant articles on volume. Also review the change in utilization after two years of additional data.	RUC removed from the high volume growth screen as it is carrier priced and does not have work or practice expense RVUs. No further action necessary.

Code	Descriptor	Screen	Date	Recommendation	Specialty	Background	CPT Asst Status
95922	Testing of autonomic nervous system function: vasomotor adrenergic innervation (sympathetic adrenergic function), including beat-to-beat blood pressure and R-R interval changes during Valsalva maneuver and at least five minutes of passive tilt	High Volume Growth / CMS Fastest Growing	Apr-08	CPT Assistant article; Review September 2011	ACP, AAN	Recommend that CPT Assistant publish article on correct coding and review in two years (April 2010)	December 2008
95956	Monitoring for localization of cerebral seizure focus by cable or radio, 16 or more channel telemetry, electroencephalographic (EEG) recording and interpretation, each 24 hours	CMS Fastest Growing	Oct-08 Feb-09	RUC recommends that this service be surveyed	AAN	Develop CPT Assistant article and RUC will discuss need for survey at the February 2009 meeting	Submitted draft of article Feb 10, 2009. Draft of article reviewed by Board, sent back to specialty to address comments.

Detailed Description of Pre-Service Time Packages (Minutes)

		FACILITY						NON-FAC	
		1A	1B*	2A	2B*	3	4	5	6
	Total Pre-Service Time	**20**	**25**	**25**	**39**	**51**	**63**	**7**	**23**
	CATEGORY SUBTOTALS								
A	Pre-Service Evaluation (IWPUT =0.0224)	13	19	18	33	33	40	7	17
B	Pre-Service Positioning (IWPUT = 0.0224)	1	1	1	1	3	3	0	1
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	5	6	5	15	20	0	5
	DETAILS								
A	History and Exam (Performance and review of appropriate Pre-Tests)	5	5	10	10	10	15	4	9
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	2	2	2	4	1	1
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	3	3	5	5	5	2	3
A	Communicate with other professionals	0	1	0	3	5	5	0	2
A	Check/set-up room, supplies and equipment	1	1	1	1	5	5	0	1
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	1	1	1	5	5	0	1
A	Prepare/ review/ confirm procedure	1	1	1	1	1	1	0	0
A	Administer moderate sedation/observe (wait) anesthesia care	0	5	0	10	0	0	0	0
B	Perform/ supervise patient positioning	1	1	1	1	3	3	0	1
C	Administer local anesthesia	1	0	1	0	0	0	0	5
C	Observe (wait anesthesia care)	0	0	0	0	10	15	0	0
C	Dress and scrub for procedure	5	5	5	5	5	5	0	0

* Indicates packages that contain moderate sedation

1A Straightforward Patient/Straightforward Procedure (No sedation/anesthesia care)
1B* Straightforward Patient/Straightforward Procedure (With sedation/anesthesia care)
2A Difficult Patient/Straightforward Procedure (No sedation/anesthesia care)
2B* Difficult Patient/Straightforward Procedure (With sedation/anesthesia care)
3 Straightforward Patient/Difficult Procedure
4 Difficult Patient/Difficult Procedure
5 Procedure without sedation/anesthesia care
6 Procedure with sedation/anesthesia care

Notes:

*Roll-over cells for additional detail where available

*Straightforward procedure: Integumentary, Non-incisional endoscopy, natural orifice

*For building block IWPUT purposes whenever the procedure is on Appendix G – (Summary of CPT codes that include moderate (conscious) sedation) the IWPUT should be .0224 for the administration of moderate sedation line item because the physician is responsible for the administration of conscious sedation. If the procedure is one where conscious sedation is not inherent the same line item should have an IWPUT of .0081.

*Additional time may be justified for a straightforward patient undergoing a straightforward procedure (Package 1B), if the procedure is performed under general anesthesia and the surveys support additional pre-service time.

CPT Code	Descriptor	Meeting	Issue	Tab	CPT Year	Date to be Re-reviewed
17106	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); less than 10 sq cm	Oct-08	Destruction of Skin Lesions	11	CPT 2009	September 2013
17107	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); 10.0 to 50.0 sq cm	Oct-08	Destruction of Skin Lesions	11	CPT 2009	September 2013
17108	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); over 50.0 sq cm	Oct-08	Destruction of Skin Lesions	11	CPT 2009	September 2013
19105	Ablation, cryosurgical, of fibroadenoma, including ultrasound guidance, each fibroadenoma	Apr-06	Fibroadenoma Cryoablation	11	CPT 2007	September 2010
20696	Application of multiplane (pins or wires in more than one plane), unilateral, external fixation with stereotactic computer-assisted adjustment (eg, spatial frame), including imaging; initial and subsequent alignment, assessment, and computation of adjustment schedule	Apr-08	Computer Dependent External Fixation	6	CPT 2009	September 2012
20697	Application of multiplane (pins or wires in more than one plane), unilateral, external fixation with stereotactic computer-assisted adjustment (eg, spatial frame), including imaging; exchange (ie, removal and replacement) of strut, each	Apr-08	Computer Dependent External Fixation	6	CPT 2009	September 2012
20985	Computer assisted surgical navigational procedure for musculoskeletal procedures; image-less (List separately in addition to code for primary procedure)	Apr-07	Computer Navigation	7	CPT 2008	September 2011
20986	Computer assisted surgical navigational procedure for musculoskeletal procedures; with image-guidance based on intra-operatively obtained images (eg fluoroscopy, ultrasound), (List separately in addition to code for primary procedure)	Apr-07	Computer Navigation	7	CPT 2008	September 2011
20987	Computer assisted surgical navigational procedure for musculoskeletal procedures; with image-guidance based on pre-operative images (eg, CT, MRI), (List separately in addition to code for primary procedure)	Apr-07	Computer Navigation	7	CPT 2008	September 2011
22526	Percutaneous intradiscal electrothermal annuloplasty, unilateral or bilateral including fluoroscopic guidance; single level	Apr-06	Percutaneous Intradiscal Annuloplast	13	CPT 2007	September 2010
22527	Percutaneous intradiscal electrothermal annuloplasty, unilateral or bilateral including fluoroscopic guidance; one or more additional levels	Apr-06	Percutaneous Intradiscal Annuloplast	13	CPT 2007	September 2010

CPT Code	Descriptor	Meeting	Issue	Tab	CPT Year	Date to be Re-reviewed
22856	Total disc arthroplasty (artificial disc), anterior approach, including discectomy with end plate preparation (includes osteophytectomy for nerve root or spinal cord decompression and microdisection), single interspace, cervical	Apr-08	Cervical Arthroplasty	7	CPT 2009	September 2012
22857	Total disc arthroplasty (artificial disc), including anterior approach, including diskectomy to prepare interspace (other than for decompression), lumbar, single interspace	Feb-06	Lumbar Arthroplasty	8	CPT 2007	September 2010
22861	Revision including replacement of total disc arthroplasty (artificial disc), anterior approach, single interspace, cervical	Apr-08	Cervical Arthroplasty	7	CPT 2009	September 2012
22862	Revision including replacement of total disc arthroplasty (artificial disc) including anterior approach, lumbar, single interspace (includes approach)	Feb-06	Lumbar Arthroplasty	8	CPT 2007	September 2010
22864	Removal of total disc arthroplasty (artificial disc), anterior approach, single interspace, cervical	Apr-08	Cervical Arthroplasty	7	CPT 2009	September 2012
22865	Removal of total disc arthroplasty (artificial disc), including anterior approach, lumbar, single interspace	Feb-06	Lumbar Arthroplasty	8	CPT 2007	September 2010
29828	Tenodesis of long tendon of biceps	Apr-07	Arthroscopic Biceps Tenodesis	17	CPT 2008	September 2011
31626	Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed;with placement of fiducial markers, single or multiple	Apr-09	Fiducial Marker Placement	6	CPT 2010	September 2013
31627	Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with computer-assisted, image-guided navigation	Feb-09	Navigational Bronchoscopy	9	CPT 2010	September 2013
32998	Ablation therapy for reduction or eradication of one or more pulmonary tumor(s) including pleur or chest wall when involved by tumor extension, percutaneous, radiofrequency, unilateral	Apr-06	Percutaneous RF Pulmonary Tumor Ablation	15	CPT 2007	September 2010
33254	Operative tissue ablation and reconstruction of atria, limited (eg, modified maze procedure)	Apr-06	Atrial Tissue Ablation and Reconstruction	17	CPT 2007	September 2010
33255	Operative tissue ablation and reconstruction of atria, extensive (eg, maze procedure); without cardiopulmonary bypass	Apr-06	Atrial Tissue Ablation and Reconstruction	17	CPT 2007	September 2010
33256	Operative tissue ablation and reconstruction of atria, extensive (eg, maze procedure); with cardiopulmonary bypass	Apr-06	Atrial Tissue Ablation and Reconstruction	17	CPT 2007	September 2010

CPT Code	Descriptor	Meeting	Issue	Tab	CPT Year	Date to be Re-reviewed
33257	Operative tissue ablation and reconstruction of atria, limited (eg, modified maze procedure); performed at the time of other cardiac procedure(s) (List in addition to the code for the primary procedure)	Apr-07	Add-on Maze Procedures	23	CPT 2008	September 2011
33258	Operative tissue ablation and reconstruction of atria, extensive (eg, maze procedure); without cardiopulmonary bypass, performed at the time of other cardiac procedure(s) (List in addition to the code for the primary procedure)	Apr-07	Add-on Maze Procedures	23	CPT 2008	September 2011
33259	Operative tissue ablation and reconstruction of atria, extensive (eg, maze procedure); with cardiopulmonary bypass, performed at the time of other cardiac procedure(s) (List in addition to the code for the primary procedure)	Apr-07	Add-on Maze Procedures	23	CPT 2008	September 2011
33265	Endoscopy, surgical; operative tissue ablation and reconstruction of atria, limited (eg, modified maze procedure), without cardiopulmonary bypass	Apr-06	Atrial Tissue Ablation and Reconstruction	17	CPT 2007	September 2010
33266	Endoscopy, surgical; operative tissue ablation and reconstruction of atria, extensive (eg, maze procedure), without cardiopulmonary bypass	Apr-06	Atrial Tissue Ablation and Reconstruction	17	CPT 2007	September 2010
33864	Ascending aorta graft, with cardiopulmonary bypass with valve suspension; with coronary reconstruction and valve sparing aortic annulus remodeling (eg, David Procedure, Yacoub Procedure)	Apr-07	Valve Sparing Aortic Annulus Reconstruction	24	CPT 2008	September 2011
34806	Transcatheter placement of wireless physiologic sensor in aneurysmal sac during endovascular repair, including radiological supervision and interpretation, instrument calibration and collection of pressure data (List in addition to the code for the primary procedure)	Apr-07	Wireless Pressure Sensor Implantation	25	CPT 2008	September 2011
43273	Endoscopic cannulation of papilla with direct visualization of common bile duct(s) and/or pancreatic duct(s) (List separately in addition to code(s) for primary procedure)	Apr-08	Cholangioscopy-Pancreatoscopy	13	CPT 2009	September 2012
43279	Laparoscopy, surgical, esophagomyotomy (Heller type), with fundoplasty, when performed	Apr-08	Laparoscopic Heller Myotomy	12	CPT 2009	September 2012
43281	Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh	Apr-09	Laparoscopic Paraesophageal Hernia Repair	12	CPT 2010	September 2013 *Review volume*

CPT Code	Descriptor	Meeting	Issue	Tab	CPT Year	Date to be Re-reviewed
43282	Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; with implantation of mesh	Apr-09	Laparoscopic Paraesophageal Hernia Repair	12	CPT 2010	September 2013 *Review volume*
43647	Laparoscopy, surgical; implantation or replacement of gastric neurostimulator electrodes, antrum	Apr-06	Gastric Antrum Neurostimulation	26	CPT 2007	September 2010
43648	Laparoscopy, surgical; implantation or replacement of gastric neurostimulator electrodes, antrum; revision or removal of gastric neurostimulator electrodes, antrum	Apr-06	Gastric Antrum Neurostimulation	26	CPT 2007	September 2010
43775	Laparoscopy, surgical, gastric restrictive procedure; longitudinal gastrectomy (ie, sleeve gastrectomy)	Apr-09	Laparoscopic Longitudinal Gastrectomy	14	CPT 2010	September 2013
43881	Implantation or replacement of gastric neurostimulator electrodes, antrum, open	Apr-06	Gastric Antrum Neurostimulation	26	CPT 2007	September 2010
43882	Revision or removal of gastric neurostimulator electrodes, antrum, open	Apr-06	Gastric Antrum Neurostimulation	26	CPT 2007	September 2010
46707	Repair of anorectal fistula with plug (eg, porcine small intestine submucosa [SIS])	Apr-09	Fistula Plug	15	CPT 2010	September 2013
50593	Ablation, renal tumor(s), unilateral, percutaneous, cryotherapy	Apr-07	Percutaneous Renal Tumor Cryotherapy	A	CPT 2008	September 2011
53855	Insertion of a temporary prostatic urethral stent, including urethral measurement	Feb-09	Temporary Prostatic Urethral Stent Insertion	12	CPT 2010	September 2013
55706	Biopsies, prostate; needle, transperineal, stereotactic template guided saturation sampling including image guidance	Apr-08	Saturation Biopsies	15	CPT 2009	September 2012
57423	Paravaginal defect repair (including repair of cystocele, if performed), laparoscopic approach	Apr-07	Laparoscopic Paravaginal Defect Repair	C	CPT 2008	September 2011
57425	Laparoscopy, surgical, colpopexy (suspension of vaginal apex)	Oct-08	Laparoscopic Revision of Prosthetic Vaginal Graft	7	CPT 2010	September 2013
57426	Revision (including removal) of prosthetic vaginal graft; laparoscopic approach	Oct-08	Laparoscopic Revision of Prosthetic Vaginal Graft	7	CPT 2010	September 2013
58541	Laparoscopy, surgical, supracervical hysterectomy, for uterus 250 grams or less;	Feb-06	Laparoscopic Supracervical Hysterectomy	13	CPT 2007	September 2010
58542	Laparoscopy, surgical, supracervical hysterectomy, for uterus 250 grams or less; with removal of tube(s) and/or ovary(s)	Feb-06	Laparoscopic Supracervical Hysterectomy	13	CPT 2007	September 2010

CPT Code	Descriptor	Meeting	Issue	Tab	CPT Year	Date to be Re-reviewed
58543	Laparoscopy, surgical, supracervical hysterectomy, for uterus greater than 250 grams;	Feb-06	Laparoscopic Supracervical Hysterectomy	13	CPT 2007	September 2010
58544	Laparoscopy, surgical, supracervical hysterectomy, for uterus greater than 250 grams; with removal of tube(s) and/or ovary(s)	Feb-06	Laparoscopic Supracervical Hysterectomy	13	CPT 2007	September 2010
58570	Laparoscopy, surgical, with total hysterectomy, for uterus 250 g or less;	Apr-07	Laparoscopic Total Hysterectomy	D	CPT 2008	September 2011
58571	Laparoscopy, surgical, with total hysterectomy for uterus 250 grams or less; with removal of tubes and/or ovary(s)	Apr-07	Laparoscopic Total Hysterectomy	D	CPT 2008	September 2011
58572	Laparoscopy, surgical, with total hysterectomy for uterus greater than 250 gram	Apr-07	Laparoscopic Total Hysterectomy	D	CPT 2008	September 2011
58573	Laparoscopy, surgical, with total hysterectomy for uterus greater than 250 grams; with removal of tubes and/or ovary(s)	Apr-07	Laparoscopic Total Hysterectomy	D	CPT 2008	September 2011
63620	Stereotactic radiosurgery (particle beam, gamma ray or linear accelerator); one spinal lesion	Apr-08	Stereotactic Radiosurgery	16	CPT 2009	September 2012

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Multi-Layer Compression System Application

In February 2009, the CPT Editorial Panel created a new code to describe treatment of chronic venous insufficiency with ulceration with multi-layer compression strapping systems.

The RUC reviewed the specialty society survey data for code 29581 *Application of multi-layer venous wound compression system, below knee* and compared it to reference code 29580 *Unna boot* (work RVU = 0.55, 8 minutes pre-service time, 12 minutes intra-service time and 7 minutes immediate post-service time). The RUC determined that 29581, application of a multi-layer compression system is more intense and complex and requires more time to apply than 29580, a single layer zinc-oxide ointment containing strapping system. The multi-layer systems come with very specific instructions for use and the various layers must be applied in a bias pattern with respect to one another. The specialty society indicated and the RUC agreed that pre-service package 5 – Non-Facility procedure without sedation/anesthesia (7 minutes) is appropriate, reflecting that the typical patient requires more complex dressings, has a larger ulcer and advanced surrounding venous skin. The survey respondents indicated an intra-service time of 15 minutes, 3 minutes more than 29580, which the specialty society and RUC agreed was appropriate to apply this multi-layer system. Additionally, the RUC agreed with the specialty society recommended immediate post-service time of 5 minutes, noting that the survey respondents indicated that this is lower than 29580 by 2 minutes even though a thorough neurovascular evaluation must be performed after application of this tight multi-layer system.

The specialty society indicated and the RUC agreed that the survey 25th percentile work RVU of 0.60 appropriately accounted for the physician work and time required to perform 29581 and placed this service in the proper rank order. The RUC also compared 29581 to a slightly more intense MPC reference code 11056 *Paring or cutting of benign hyperkeratotic lesion (eg, corn or callus); 2 to 4 lesions* (work RVU = 0.61) to further support this work RVU. **The RUC recommends the survey 25th percentile, 0.60 work RVU for 29581.**

Practice Expense

The RUC reviewed the practice expense and made minor edits to the medical supplies for code 29581.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
29540		Strapping; ankle and/or foot (Do not report 29540 in conjunction with 29581)	000	0.51 (No Change)
•29581	S1	Application of multi-layer venous wound compression system, below knee (Do not report 29581 in conjunction with 29540, 29580)	000	0.60
29580		Unna boot (Do not report 29580 in conjunction with 29581)	000	0.55 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:29581 Tracking Number S1 Specialty Society Recommended RVU: **0.60**

Global Period: 000 RUC Recommended RVU: **0.60**

CPT Descriptor: Application of multi-layer venous wound compression system, below knee

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman returns to the office for treatment of a medial calf ulcer. It measures 3x3 cm and demonstrates no signs of infection. She has palpable pedal pulses. Pigmented skin changes in the gaiter distribution of both lower extremities are consistent with chronic venous insufficiency. The wound is examined, cleansed and a multilayer venous ulcer compression dressing is applied.

Percentage of Survey Respondents who found Vignette to be Typical: 77%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 100%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: An abbreviated history is obtained. All prior dressings are removed, taking care to avoid injuring the underlying skin. Physical exam is performed which assesses adequate arterial flow, the presence of infection, the degree of swelling, and the size/depth of the lower extremity ulcer. Treatment options are reviewed and communication occurs with the patient (and/or the patient's family) to explain the procedure, including a discussion of possible risks and complications.

Description of Intra-Service Work: The ulcer is cleansed, and a primary wound dressing is then applied. With the foot in a dorsiflexed position, application of the compression bandage is initiated with a circular winding at the base of the toes. The second circular winding follows and covers the top of the foot and articulating aspect of the ankle joint. The next winding is applied and covers the back of the heel and the calf. Frequent checks are performed to ensure the foot is in a neutral position relative to the ankle. Each subsequent application is applied at the specific stretch needed for the desired compression.

Description of Post-Service Work: The patient's neurovascular status is evaluated after the dressing system has been completely applied and is allowed to "set" for a few minutes. A surgical shoe is fitted on the patient. Instructions are provided for care and activity. Progress note and any correspondence with referring physicians are completed.

Intra-Service intensity/complexity	3.05	2.88
Post-Service intensity/complexity	2.00	2.10

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

RATIONALE

Clinical Overview: Maintenance therapy for chronic venous insufficiency in patients without ulceration is usually accomplished with medical-grade graduated compression stockings. However, the mainstay of therapy in treating chronic venous insufficiency with ulceration is compression strapping systems. The Unna boot (29580) is a single layer

zinc-oxide ointment containing strapping system. New code 29581 describes a newer multi-layer compression device that has been demonstrated in numerous scientific analyses, including a Cochrane review, to provide faster and superior wound healing. The multi-layer systems are more sophisticated than the single layer Unna boot and require more time and more attention to detail to apply correctly.

RVW Recommendation: The multi-specialty consensus committee recommends **the survey 25th percentile work RVU or 0.60** which is slightly greater than key reference code 29850. This value reflects the incremental time and complexity of the multi-layer system compared with the key reference, Unna boot.

Pre-Time Considerations: We recommend package 5 (non-facility procedure without sedation/anesthesia care)

- Evaluation: no change (7 min)

It should be noted that this is a very substantial reduction from the actual survey Pre-Service time of 26.

Work Comparison to key reference code: 29850 Unna boot

New code 2985X Application of multi-layer venous wound compression system is more complex and more time consuming than application of an Unna boot. The multi-layer systems come with very specific Instructions for Use, and the various layers must be applied in a bias pattern with respect to one another. This additional work is reflected in the survey data by an additional 3 minutes of intra-service time. Also, 9 of the 11 intensity and complexity measures are greater for 2958X than 29580, confirming that the intra-work is slightly more complex.

Pre-service time is 2 minutes longer for 2958X than 29580, reflecting the fact that the typical patient requiring this more complex dressing has a larger ulcer and more advanced surrounding venous skin changes than the typical 29580 patient. Removing the prior dressing and cleansing the wound and adjacent limb take longer and requires more attention. It should be noted that the actual survey Pre-Service time was 26 minutes, and our Expert Panel reduced that value to 10 minutes to be in keeping with package 5 and to be more appropriately related to the key reference service pre-time of 8 minutes.

Immediate post-service time in the survey median value is 5 minutes. This is actually 2 minutes less than post-service time of 29580 Unna boot. A thorough neurovascular evaluation must be performed after application of this tight, strong, multi-layer dressing. It doesn't make any clinical sense that the post-time would be 2 minutes less than the reference service, but we decided not to change it.

Given all these considerations, including 3 additional minutes of total time over the key reference, we believe that the recommended RVW of 0.60 is appropriately valued when compared to the 0.55 RVW of the key reference.

Work Comparison to MPC List Code: 11056 Paring or cutting of benign hyperkeratotic lesion (eg, corn or callus); 2 to 4 lesions

11056 is a RUC-surveyed MPC list service valued at 0.61. It has 8 minutes of intra-service time and 15 minutes total time. 11056 is commonly performed by podiatrists, as will be the new code 29581. The new code has twice the intra-time (15 compared to 8 minutes) and twice the total time (30 compared to 15 minutes), while the reference code is slightly more intense. By this comparison, a recommended RVW of 0.60 is appropriate, perhaps conservative.

Work Comparison to Another MPC List Code: 29075 Application of short arm cast.

29075 is application of a short arm cast, typically performed for a fracture, while 29581 will be performed on the lower extremity for an ulcer. 29075 is a RUC surveyed service (2005) with Intra-time of 15 minutes and total time of 25 minutes. 29581 has the same intra time (15 minutes) and 5 more minutes total time (30 compared to 25 minutes). 29075 has somewhat greater complexity because the fractured limb must be maintained in alignment while the cast is applied. Both services require a thorough neurovascular check during post-service, and both require instructions be given to the

patient. 29075 has an RVW of 0.77. Given the similarities noted here, we believe an RVW of 0.60 for the new service ranks it appropriately with respect to this MPC reference.

IWPUT

IWPUT for short and low intensity services does not seem to have the discriminative value that it does for large 90-day global services, but at the recommended RVW and time values, the IWPUT of this service is 0.020, which is the same as the key reference service. At very least, this indicates that our recommendation of 0.60 is not over-valued when considered with respect to the time involved.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) When a patient undergoes initial evaluation of a leg ulcer, a consultation E&M code will be appropriately reported because there is a wide differential diagnosis for skin wounds and ulcers. The patient will need all elements of History, ROS, PMH, FHSH, Meds, Allergies, full physical exam, diagnostic study evaluation and significant medical decision making. However, once the diagnosis of venous ulcer is established and the course of wound care prescribed, the patient undergoing multi-layer dressing will not need a coincident E&M service during a typical visit. ONLY the 2958X code will be reported. This pattern is analogous to the 29580 Unna boot code, wherein Todd Klemp of AMA RUC determined that 70% of 29580 services are reported WITHOUT a coincident E&M.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. As noted above, typical scenario for multiple codes will be first time evaluation of patient with leg ulcer. In this case a level 2 or level 3 outpatient consultation is likely to be co-reported. Subsequently, an established patient office visit would be reportable ONLY if the patient has suffered a significant deterioration in status such that a full reconsideration of his/her status must be undertaken. In that situation, appropriate documentation would be required to justify co-reporting of 29581 and the established patient visit. As noted above, Mr. Klemp determined that only 30% of the parent code 29580 are reported with an E&M service (therefore 70% without E&M).

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) We believe the majority of these services have been reported as 29580. However, one of the ma. reasons for requesting this code is fact that several carriers deny payment for 29580 when a multilayer dressing is used instead of an Unna boot. It is impossible to determine how large this component is, and whether providers who are routinely denied payment for this reason are submitting (or resubmitting) using an unlisted service code.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Podiatry How often? Commonly

Specialty Vascular Surgery How often? Sometimes

Specialty General Surgery How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 300000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We have no way of accurately predicting the utilization of this new CPT code, however, the number will not be trivial. It has been estimated that 2.5 million patients have venous ulcers in the US, but it is not known how many of those patients seek professional medical advice for the problem. CPT 29580, the single layer Unna boot is reported almost 450,000 times to Medicare per year, and since venous ulcers occur commonly in individuals younger than Medicare age, we could estimate the overall frequency may be twice Medicare, perhaps as many as 900,000 per year. Some proportion of these will be switched from 29580 to the new code. Also, we don't have estimates of how many multi-layer dressings are reported as unlisted service to Carriers who deny 29580 for this purpose. Podiatrists are the dominant provider of 29580 Unna boot, which is the only current CPT code used to report an analogous product. We believe the new service will be provided along similar specialty proportionality lines: Podiatry 36%, General Surgery 20%, Vascular Surgery 10%, Family Practice 7%, Derm 7%, Nurse Practitioner 5%, Internal Medicine 4%, PA 2%, PT 2%

Specialty Podiatry	Frequency 180000	Percentage 60.00 %
Specialty General Surg	Frequency 60000	Percentage 20.00 %
pecialty Vasc Surg	Frequency 30000	Percentage 10.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 150,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The assumption here is that one-third of dressings currently reported as 29580 will be switched to 29581, and another contribution to frequency will derive from providers who currently use an unlisted code for this service. The latter is impossible to predict, so we chose one-third of the 29580 frequency.

Specialty Podiatry	Frequency 90000	Percentage 60.00 %
Specialty Gen Surg	Frequency 30000	Percentage 20.00 %
Specialty Vasc Surg	Frequency 15000	Percentage 10.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

. no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The direct non-facility practice expense details were discussed by a consensus committee of podiatrists, vascular surgeons, general surgeons, and physical therapists representing a variety of practice types and geographic settings.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:

The procedure room is prepared, making certain supplies and equipment necessary are available. Clinical staff reviews the chart to be certain all pre-procedure information is available and the H&P is current. The patient will be greeted and gowned. The procedure is reviewed with the patient/family. The prior dressing is removed. Clinical staff assists the physician with cleansing the wound, preparing for the new dressing, and positioning the patient and leg. Clinical staff will assist physician 2/3 of total physician intra-time. After completion of the procedure, clinical staff will monitor the patient who needs to maintain position while dressing dries; clean the room; provide instructions on dressing protection/care and activities (eg, bathing, leg elevation); discuss follow-up visits; and assist the physician with surgical shoe placement and adjustment.

Post-Service Clinical Labor Activities

Clinical staff will respond to phone call(s) from patient/family/caregiver regarding dressing protection/care and activities (eg, bathing, leg elevation).

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
April 2009

Fiducial Marker Placement

Stereotactic radiosurgery (SRS) is now performed throughout the entire body as existing technology is being utilized in an array of different permutations with variable physician and clinician collaboration models. Currently, there are CPT codes for fiducial placement for the prostate, brain, and spine, however the FDA has approved SRS to be performed for lesions, tumors and conditions anywhere in the body. Current coding schemes do not accurately reflect the components, shared work, and reality that multiple clinicians contribute to the delivery of this complex services, and thoracic and abdominal SRS have become more common over the past several years for treatment of inoperable tumors. In February 2009, the CPT Editorial Panel developed two new codes to cover fiducial placement in the thorax and abdomen and one code to describe electromagnetic navigation bronchoscopy of the pulmonary tract for the purposes of placing radiosurgical markers for SRS or for the purposes of placing dye markers for surgical assistance in video-assisted thoracic surgery (VATS) procedures.

31626 ***Bronchoscopy, rigid or flexible, including fluoroscopic guidance; with placement of fiducial markers, single or multiple***
The RUC reviewed the specialty survey results from 38 pulmonologists. The survey respondents chose CPT code 31629 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with transbronchial needle aspiration biopsy(s), trachea, main stem and/or lobar bronchus(i)* (Work RVU = 4.09, 000 day global) as the key reference service. Code 31626 is typically performed in the facility setting and is considered straight forward requiring sedation/anesthesia care, much like its reference service. The survey respondents indicated a median physician work relative value slightly higher than the reference code, with similar physician complexities and intensities. The survey respondents indicated that the intra-service period is 15 minutes longer for 31626 than reference code 31629 because precision is required to inject dye markers into the soft lung tissue. The RUC agreed with the survey respondents median work relative value of 4.16 which provides for the proper work valuation and rank order for this new service in comparison to the reference code. **The RUC recommends a physician work relative value of 4.16 RVUs for new code 31626.** Moderate sedation is also required for this service and it will be displayed in appendix G for CPT 2010.

32553 ***Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-thoracic, single or multiple***
The RUC reviewed the specialty's survey results carefully and concurred that the appropriate pre-service time package for this service should reflect a straightforward patient and procedure with sedation/anesthesia care, pre-time package 1b. This change aligns the

physician time and work with similar services such as new code 31626 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance; with placement of fiducial markers, single or multiple* (recommended Work RVU = 4.16, 000 day global), however the RUC concurred that this new service requires less work to perform as it does not involve a bronchoscopy. The RUC also reviewed the specialties key reference service 32998 *Ablation therapy for reduction or eradication of one or more pulmonary tumor(s) including pleura or chest wall when involved by tumor extension, percutaneous, radiofrequency, unilateral* (Work RVU = 5.68, 000 day global) in relation to new code 32553, and agreed 32998 required somewhat similar techniques; however, the service is much more complex, and intense, and required more physician time. 32998 was surveyed having 60 minutes of intra-service time whereas 32553 was indicated to have 45 minutes. In addition to the specialty's key reference service, the RUC reviewed another similar service 31628 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with transbronchial lung biopsy(s), single lobe* (Work RVU = 3.80, 000 day global, 40 minutes intra-service time) and agreed the physician work value of new code 32553 should be aligned with 31628 as the surveyed physician time, intensities, and complexities were similar. Although a value of 3.80 RVUs is below the low of the specialty's surveyed RVW results the RUC agreed it is appropriate and preserves rank order amongst other similar services. **The RUC recommends a physician relative work value of 3.80 for CPT code 32553.** To support the relativity amongst services the committee also reviewed the work, time, and intensities of codes 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (Work RVU 4.17, 000 day global) and 36556 *Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older* (Work RVU = 2.50, 000 day global).

49411 ***Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-abdominal, intra-pelvic (except prostate), and/or retroperitoneum), single or multiple***

The RUC reviewed the specialties survey results carefully and concurred that the appropriate pre-service time package for this service should reflect a straightforward patient and procedure with sedation/anesthesia care, pre-time package 1b. CPT code 49411 is slightly more complex when compared to new code 32553 as reflected in the median survey data which shows 5.70 Work RVUs 32553 and 6.00 work RVUs for 49411. The specialty societies explained and the RUC agreed that there is a greater degree of difficulty in placing fiducial markers in the abdomen because of the increased number of anatomic structures in the abdomen (ie. liver, spleen, stomach, bowel, pancreas) as compared to the anatomic structures in the thorax (ie, lungs) which makes 49411, as compared to 32553, more difficult to reach the tumor. It was also agreed that the greater difficulty posed by the increased number of structures outweighed the risk of pneumothorax in the chest. This 0.02 work RVU increment between 49411 and 32533 accurately reflects the difference in difficulty in performing the procedure The RUC also reviewed code 31630 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with tracheal/bronchial dilation or closed reduction of fracture* (work RVU = 3.81, 45 minutes intra-service time) in relation to the new code as well. After reviewing all of the survey data in its entirety, the RUC concurred that 49411 should be valued at 3.82 Work RVUs. **The RUC recommends a physician work relative value of 3.82 for CPT code 49411.**

New Technology
The RUC recommends that codes 31626, 32553, and 49411 be placed on the new technology list.

Direct Practice Expense Inputs
The practice expense direct inputs recommended by the specialty were reviewed carefully, edited slightly for appropriate clinical labor time, and approved for these services.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31626 Tracking Number T1 Specialty Society Recommended RVU: **4.16**

Global Period: 000 RUC Recommended RVU: **4.16**

CPT Descriptor: Bronchoscopy, rigid or flexible, including fluoroscopic guidance; with placment of fiducial markers, single or multiple (Report supply of device separately) (Use 31626 in conjunction with 31615, 31627, 31623-31631, 31635, 31636, 31638-31643)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old smoker with COPD and lung cancer undergoes bronchoscopy to place fiducial markers into the airways or lung parenchyma.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Percent of survey respondents who stated they perform the procedure; In the hospital 68% , In the ASC 68%, In the office 5%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 68%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 100%

Is moderate sedation inherent in your reference code (Office setting)? Yes
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? Yes

Description of Pre-Service Work: • Hospital outpatient or ASC admission and preprocedural work-up, review of records, communication with other professionals, patient and family.
- Obtain informed consent.
- The physician and staff dress in a disposable gown, non-sterile gloves, and protective eyewear before the procedures. Don lead apron for fluoroscopic guidance, if used.
- Preparing and positioning the patient and equipment.
- The physician examines the patient to verify that the patient can undergo the procedure.
- The physician verifies the identity of the patient and the procedure to be performed in accord with JCAHO regulations.

Description of Intra-Service Work: • The patient is placed on supplemental oxygen in the bronchoscopy suite which has resuscitative equipment in place.
- An IV is started and the physician supervised the nebulized administration of inhaled topical anesthesia.
- The physician next applies local topical anesthesia to the propharynx and nasopharanx.
- The physician than supervises administration of moderate sedation while a registered nurse or physician assistant properly monitors the pulse, blood pressure, SPO2, and ECG.

- The physician inserts the bronchoscope through the upper airways noting any abnormalities. The vocal cords are visualized and the structure and function are noted.
- Pre-mark the needle-catheter or dye marker delivery tool and place a tool-limit mark on the proximal side of the tool.Navigate and reach the desired targeted tumor(s). Load the syringe with the desired dye marker volume. Tl bronchoscope is advanced into the tracheobronchial tree noting any abnormalities. Load the syringe and/or catheter with the desired dye marker volume or fiducial marker. Insert the marker delivery tool into the catheter channel. Imaging (fluroscopy, ultrasound, or other) is used to verify placement and position of the delivery catheter or dye marker tool. Inject the dye marker into the soft lung tissue at target locations. Typically a median of 4 fiducial markers are placed. Remove the needle catheter or dye marker delivery tool.
- All steps in previous points are repeated until all targeted lesions and all markers have been placed.

Description of Post-Service Work: • The physician examines the patient post-bronchoscopy and pre-discharge from the facility to ascertain that no complications, such as bleeding, plugging, or shortness of breath have occurred.

- The findings from the bronchoscope are explained to the patient and/or family/friend
- The physician again reinforces previous instructions about post-procedure complications.
- The physician communicates results to the referring physician.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
31629	000	4.09	**RUC Time**

CPT Descriptor Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with transbronchial needle aspiration biopsy(s), trachea, main stem and/or lobar bronchus(i)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
31622	000	2.78	**RUC Time**	92,211

CPT Descriptor 1 Bronchoscopy, rigid or flexible, including fluoroscopic guidance; diagnostic, including cell washing, when performed

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
31600	000	7.17	**RUC Time**	40,512

CPT Descriptor 2 Tracheostomy, planned (separate procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
31628	000	3.80	**RUC Time**

CPT Descriptor Bronchoscopy, rigid or flexible, including fluoroscopic guidance; with transbronchial lung biopsy(s), single lobe

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 26 **% of respondents:** 68.4 %

TIME ESTIMATES (Median)	CPT Code: 31626	Key Reference CPT Code: 31629	Source of Time RUC Time
Median Pre-Service Time	25.00	30.00	
Median Intra-Service Time	45.00	30.00	
Median Immediate Post-service Time	15.00	20.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00

Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.26	3.15
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.34	4.19
Urgency of medical decision making	2.76	2.73

Technical Skill/Physical Effort (Mean)

Technical skill required	3.76	3.65
Physical effort required	4.20	4.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.50	3.50
Outcome depends on the skill and judgment of physician	4.76	4.15
Estimated risk of malpractice suit with poor outcome	3.96	3.73

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.88	3.53
Intra-Service intensity/complexity	4.38	4.11
Post-Service intensity/complexity	3.65	3.50

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Practice Management Committee of the American College of Chest Physicians (ACCP) and the Clinical Practice Committee of the American Thoracic Society (ATS) independently reviewed the survey data and the practice expense inputs and are submitting their consensus recommendation for RUC review.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This service is typically performed by the same physician. For 2010, it is expected that this code will be reported with other bronchoscopy codes, 31615, 31623-31631, 31635, 31636, 31638-31643,3262X7. The Multiple Endoscopy Rule applys: total reimbursement is the full reimbursement for the most complex bronchoscopic procedure and the sum of the differences in reimbursement between each of the less complex codes and the base bronchoscopy code for a single patient. This means that other than the first reported highest RVU bronchoscopy code reported (eg, 31628, 31629), that each additional bronchoscopy code reported has -2.78 RVUs subtracted from the total RVW for that code, if reported alone.The surveyees were asked what other codes are typicall reported in addition to this code, and the response was:

31628 Bronchoscopy, rigid or flexible, including fluoroscopy; with transbronchial lung biopsy, single lobe (000) 3.80RVW 30/40/20=90 + add-on code for planning and navigation, 3162X7 Bronchoscopy, rigid or flexible, including fluoroscopic guidance; with computer-assisted, image-guided navigation (ZZZ) +2.00RVW (if approved by CMS in the Nov. Final Rule)

Typical Scenario for 2009 Reporting of Bronchoscopic Placement of Fiducial Markers

CPT Code	Descriptor	Global Period	Work RVU	Pre/intra/post TIME (min)
31628	Bronchoscopy, rigid or flexible, with or without fluoroscopy; with transbronchial lung biopsy, single lobe	000	3.80	30/40/20=90
31629	Needle aspiration biopsy	000	4.09	30/30/20=80
31622	Base Bronchoscopy code included in 3162X6	000	2.78	20/30/15=65
3162X6	With placement of fiducial markers, single or multiple	000	Subtract 2.78 from final RVU because reported with 31628, 31629	
31623	Brushings	000	2.88-2.78 = 0.10	20/30/20=70 – 65 = 5
31624	Lavage	000	2.88-2.78 = 0.10	20/30/20=70 – 65 = 5

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31899 unlisted code: see CPT Assistant, March 2008 said to report 76499, unlisted diagnostic radiographic procedure

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary Medicidne How often? Sometimes

Specialty Thoracic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. To date, both surveys indicate that this procedure is performed by Thoracic Surgeons 10% of the time.

Specialty Pulmonary Medicine Frequency 900 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 100 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 500
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 50% is a guess

Specialty Pulmonary Medicine Frequency 450 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 50 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 32553 Tracking Number T2 Specialty Society Recommended RVU: **4.99**

Global Period: 000 RUC Recommended RVU: **3.80**

CPT Descriptor: Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-thoracic, single or multiple

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old male presents with a stage 1A non-small cell lung cancer in the right upper lobe. The patient has gold tracking fiducial implants inserted using a transthoracic approach.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an I&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 94%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 100%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:
-Discuss procedure details, including alternatives and risks with the patient and family and informed consent is reviewed
-Estimate the range of devices that may be required and ensure all are available for use
-Ensure all technical personnel have been familiarized with the procedure and are fully familiar with all required devices
-Re-review applicable, available prior films

Description of Intra-Service Work:
-Check IV set up
-Supervise the positioning of the patient in a supine position
-Administer moderate sedation
-Prep and drape the chest
-Confirm tumor localization
-Apply local anesthesia for three needle entry sites
-Introduce preloaded gold fiducial markers into the periphery of the tumor in a triangular array
-Confirm placement of markers is within 2 mm of the tumor margin
-Verify complications such as bleeding, hematoma, and pneumothorax have not occurred

Description of Post-Service Work:
- Dictate operative report
- Review, revise and sign final report
- Communicate to the family and oncologist concerning number of markers placed and their location with respect to vi organs
- Discuss outcome with patient and family; remove family from location of fiducials

Post-Service intensity/complexity	3.25	3.53

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACR and SIR convened a panel that included a number of physicians familiar with this service to review the RUC survey data. The reference code selected most commonly was code 32998 (Ablation therapy for reduction or eradication of one or more pulmonary tumor(s) including pleura or chest wall when involved by

tumor extension, percutaneous, radiofrequency, unilateral) with a work value of 5.68. The median work value for 32553 is 5.70, which was slightly higher than the reference service code. The panel felt the services are generally comparable since 3 or more separate fiducial placements are necessary, each requiring a new and different site of access and placement. Additionally, some of the intra-service time for 32988 is associated with the relatively low intensity work of waiting for thermal heating cycles to occur which accounts for the lower IWPUT of the reference service at 0.070. Further, as compared to 49411, there is additional time and effort is required to assess and evaluate for pneumothorax as it relates to placement of the additional markers. We believe that the fiducial marker placement codes can be likened to the placement of three central lines (36556) sequentially in the same patient. While it is difficult to accurately value that scenario, the example supports the higher intensity of 32553 as compared to the reference service.

We also recognize that our respondents included pre-service time above the standard RUC package applicable to this service. We recommend removing the pre-service time above those in the package and we recommended removing those RVUs from the 25th percentile value as well.

The panel recommends a value just below 25th percentile with a work value of **4.99** with the median physician time adjusted to the appropriate pre-service package of 39 min pre, 45 min intra, and 20 min post, which is considered appropriate for code 32553. The IWPUT for the reference service is 0.070. The IWPUT is 0.083 for code 32553 reflecting the difference in intensity discussed above.

Other 000 codes for comparison include,

	Work RVU	Pre	Intra	Post	
32550	4.17	40	30	20	Insertion of indwelling tunneled pleural catheter with cuff
58558	4.74	30	40	20	Hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D & C

These services have time and intensity in the same range as 3255X and support the societies' recommendation at 4.99 RVU.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is

involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

		3255X plus	77002 or	77012 or	76942 or	77021

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32999 and modality specific imaging guidance code

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Rarely

Specialty Interventional Radiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4251
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 32999 was previously used to report 3255X. The 2007 Medicare data estimates codes 32999 was billed approximately 1417. The overall number of services for 3255X in a one year period is estimated to be 4251.

Specialty Radiology Frequency 1870 Percentage 43.98 %

Specialty Interventional Radiology Frequency 382 Percentage 8.98 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,417 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Code 32999 was previously used to report 3255X. The 2007 Medicare data estimates codes 32999 was billed approximately 1417. Diagnostic radiology accounts for 628 and interventional radiology 123.

Specialty Radiology Frequency 628 Percentage 44.31 %

Specialty Interventional Radiology Frequency 123 Percentage 8.68 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. CPT 31628 is a more reasonable crosswalk.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 49411 Tracking Number T5 Specialty Society Recommended RVU: **4.59**

Global Period: 000 RUC Recommended RVU: **3.82**

CPT Descriptor: Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-abdominal, intra-pelvic (except prostate), and/or retroperitoneum), single or multiple

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old female presents with an unresectable pancreatic adenocarcinoma in the head of the pancreas. She has gold tracking fiducial implants inserted using a percutaneous approach.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 100%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 100%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:
-Discuss procedure details, including alternatives and risks with the patient and family and informed consent is reviewed
-Estimate the range of devices that may be required and ensure all are available for use
-Ensure all technical personnel have been familiarized with the procedure and are fully familiar with all required devices
-Re-review applicable, available prior films

Description of Intra-Service Work:
-Check IV set up
-Supervise the positioning of the patient in a supine position
-Administer moderate sedation
-Prep and drape the abdomen
-Confirm tumor localization
-Apply local anesthesia for three needle entry sites
-Introduce preloaded gold fiducial markers into the periphery of the tumor in a triangular array
-Confirm placement of markers is within 2 mm of the tumor margin
-Verify complications such as bleeding and hematoma have not occurred

Description of Post-Service Work:
- Dictate operative report
- Review, revise and sign final report
-Communicate to the family and oncologist concerning number of markers placed and their location with respect to vi organs
- Discuss outcome with patient and family; remove family from location of fiducials

Pre-Service intensity/complexity	2.91	2.45
Intra-Service intensity/complexity	3.73	2.91
Post-Service intensity/complexity	2.77	2.41

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACR and SIR convened a panel that included a number of physicians familiar with this service to review the RUC survey data. The reference code selected most commonly was code 48102 (Biopsy of pancreas, percutaneous needle) with a work value of 4.68. The panel agreed with the survey respondents that as compared to the reference service, there is additional work in 49411 to place 3 or more separate fiducial

markers since each requires a new and different site of access and placement. However, what was likely not considered by the survey respondents was that 48102 is assigned a global period of 010 and includes 0.87 RVUs of post-service work within the global period that would be separately reportable for 49411. This makes the comparative value of 48102 3.81 RVU.

As such, we believe that the 25th percentile value of 4.88 more closely reflects the work for 49411. Additionally, we recognize that the intra-service time for the two codes is approximately the same but consider the work of 3 or more separate needle placements to be considerably more intense than the work of obtaining specimens after a single needle placement. We believe that the fiducial marker placement codes can be likened to the placement of three central lines (36556) sequentially in the same patient. While it is difficult to accurately value that scenario, the example reflects the higher intensity of 494X2 as compared to the reference service.

The panel recommends a value just below 25th percentile with a work value of **4.59** with the median physician time adjusted to the appropriate pre-service package of 39 min pre, 40 min intra, and 20 min post, which is considered appropriate for code 49411. The IWPUT for the reference service is 0.065. The IWPUT is 0.084 for code 49411 reflecting the difference in intensity discussed above.

Other 000 codes for comparison include,

	Work RVU	Pre	Intra	Post	
32550	4.17	40	30	20	Insertion of indwelling tunneled pleural catheter with cuff
58558	4.74	30	40	20	Hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D & C

These services have time and intensity in the same range as 494X2 and support the societies' recommendation at 4.59 RVU.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☒ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: Bronchoscopy, rigid or flexible, including fluoroscopic guidance; with placement of fiducial markers, single or multiple (Report supply of device separately) (Use 31626 in conjunction with 31615, 31627, 31623-31631, 31635, 31636, 31638-31643)

Global Period: 000

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The practice expenses were developed by the American College of Chest Physician's (ACCP) Practice Management Committee and the American Thoracic Society (ATS) Clinical Practice Committee. There is good practice-type and geographic representation with the two pulmonary groups involved.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- **Hospital outpatient and ASC admission and preprocedural work-up, review of records, communication with other professionals, patient and family.**
- **Obtain informed consent.**
- **Dress in gown, non-sterile gloves and eye shield before the procedure. Don lead apron for fluoroscopic guidance, if used.**
- **Prepare and position the patient and equipment, following instructions by the physician.**
- **The RN/RT also verifies the identity of the patient and the procedure to be performed in accord with JCAHO regulations.**

Intra-Service Clinical Labor Activities:

- **The patient is placed by the RN/RT on supplemental oxygen in the bronchoscopy suite which has resuscitative equipment in place.**
- **An IV is started by the RN/RT and the physician supervises the nebulized administration of inhaled topical anesthesia.**
- **The physician next applies local topical anesthesia to the propharynx and nasopharanx.**
- **Under moderate sedation, administered by the physician, the RN or PA properly monitors the pulse, blood pressure, SPO2, and ECG.**

Post-Service Clinical Labor Activities:

- **The RN/RT examines the patient post-bronchoscopy and pre-discharge from the facility to ascertain that no complications, such as bleeding, plugging, or shortness of breath have occurred.**
- **The findings from the bronchoscope are also explained to the patient and/or family/friend**
- **The RN/RT reinforces previous instructions about post-procedure complications.**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The SIR and ACR convened a group of radiologists and interventional radiologists from a broad range of geographic locations with differing practice circumstances and settings, who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Follow-up phone calls and prescriptions

Post-Service Clinical Labor Activities:

- Conduct phone calls/call in prescriptions

Please see corresponding PERC spreadsheet for additional detail.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
000 Day Global Period
Non-Facility Direct Inputs

CPT Long Descriptor:
Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-thoracic, single or multiple

Sample Size:_N/A_____ Response Rate: (%): N/A_____Global Period:_000____

Geographic Practice Setting %: All geographical practice settings represented

Type of Practice %: All practice types represented

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The SIR and ACR convened a group of radiologists and interventional radiologists from a broad range of geographic locations with differing practice circumstances and settings, who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
- Complete pre-service diagnostic and referral forms
- Schedule space and equipment in facility
- Follow-up phone calls and prescriptions

Intra-Service Clinical Labor Activities
- Review charts
- Greet patient and provide gowning
- Obtain vital signs
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/monitor patient
- Sedate/apply anesthesia
- Assist physician in performing procedure
- Assist physician Conscious Sedation monitoring; Assist physician monitoring
- Monitor patient following service/check tubes, monitors, drains. Recovery time is typically 2 hours with the patient is checked every 20 minutes for a minimum of 5 minutes (equivalent of 6 Level 2 vital checks).
- Check dressings and wound/home care instructions/coordinate office visits/prescriptions
- Clean room/equipment

Post-Service Clinical Labor Activities:

- Conduct phone calls/call in prescriptions

Please see corresponding PERC spreadsheet for additional detail.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Navigational Bronchoscopy

In October 2008 the CPT Editorial Panel created a new add-on code to describe the pre-planning, real time navigation of the bronchus or placement of fiducial markers.

The RUC reviewed the specialty society recommendation for 31627 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with computer-assisted, image-guided navigation* and agreed with the physician time and work presented and supported by the survey median (60 minutes intra-service time and work RVU = 2.00). The RUC agreed that the physician work required for planning/mapping, downloading CT information and registering information typically would take 30 minutes and the actual performance of directional bronchoscopy would take an additional 30 minutes. The RUC compared 31627 to 31637 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; each additional major bronchus stented* (work RVU = 1.58, intra-service time = 30) and determined this supported the physician time and work required to perform 31627 as 31637 does not include an additional 30 minutes of planning and mapping. **The RUC recommends a work RVU of 2.00 for code 31627.**

Practice Expense
The RUC recommends the specialty society recommended practice expense inputs for the non-facility setting as attached.

New Technology
The RUC recommends that code 31627 be placed on the new technology list for future review.

Modifier -51 Exempt
The RUC recommends that code 31627 be placed on the Modifier-51 Exempt list as this procedure is typically performed with another procedure. The RUC recommended value is based on its Modifier -51 exempt status.

Moderate Sedation
The RUC recommends that 31627 be added to the Moderate Sedation List.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Ø 31622		Bronchoscopy, rigid or flexible, including ~~with or without~~ fluoroscopic guidance when performed; diagnostic, ~~with or without~~ cell washing when performed (separate procedure)	000	2.78 (No Change)
Ø•+31627	E1	with computer-assisted, image-guided navigation (List separately in addition to code for primary procedure[s]) (31627 includes 3D reconstruction. Do not report 31627 in conjunction with 76376, 76377) (Use 31627 in conjunction with 31615, 31622-31631, 31635, 31636, 31638-31643)	ZZZ	2.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31627 Tracking Number E1 Specialty Society Recommended RVU: **2.00**

Global Period: ZZZ RUC Recommended RVU: **2.00**

CPT Descriptor: Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with computer-assisted, image-guided navigation

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old smoker has a single 9.0 mm lung nodule on CT of the chest. The peripheral nodule is not amenable to biopsy by routine bronchoscopy, so the patient is scheduled for navigational bronchoscopy.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

s moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 74%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 19%

Is moderate sedation inherent in your reference code (Office setting)? Yes
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? Yes

Description of Pre-Service Work:

Description of Intra-Service Work:
Planning Phase:
Pre-service part of intra-service physician work for the add-on code
Previously acquired CT scan of the lungs is imported into the planning laptop with special software for performing navigational bronchoscopy; a three-dimensional image of the patient's lungs is generated by the planning software; the physician marks the anatomical points and target lesion(s) on the virtual and CT images; the virtual and CT images are used to plan the path that the guide catheter (extended working channel) and the steerable navigation catheter (locatable guide) will follow in the bronchial tree; and the patient's virtual plan is saved and exported to a flash drive.

Navigation Phase – intra-service physician work
The patient's virtual plan is downloaded into the computer; moderate sedation is administered; The guide catheter and erable navigation catheter are inserted together (one inside the other) into the bronchoscope channel; CT images and eering directions on the monitor are used by the physician to navigate the guide catheter and steerable navigation catheter in real-time to target areas; the guide catheter is locked in place and the steerable navigation catheter is removed; and endobronchial tools are inserted through the guide catheter are used to collect tissue samples that are separately billed as a biopsy.

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
31637	ZZZ	1.58	**RUC Time**

CPT Descriptor Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; each additional major bronchus stented (List separately in addition to code for primary procedure)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
94010	XXX	0.17	**RUC Time**	1,273,273

CPT Descriptor 1 Spirometry, including graphic record, total and timed vital capcity, expiratory flow rate measurement(s), with or without maximal voluntary ventilation

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
95810	XXX	3.52	**RUC Time**	271,044

CPT Descriptor 2 Polysomnography; sleep staging with 4 or more additional parameters of sleep, attended by a technologist

Other Reference CPT Code	Global	Work RVU	Time Source
31620	ZZZ	1.40	**RUC Time**

CPT Descriptor Endobronchial Ultrasound (EBUS) during bronchoscopic diagnostic or therapeutic intervention(s) (List separately in addition to code for primary procedure(s))

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 14 **% of respondents:** 26.4 %

TIME ESTIMATES (Median)	CPT Code: 31627	Key Reference CPT Code: 31637	Source of Time RUC Time

Time Segments (Mean)

Pre-Service intensity/complexity		
Intra-Service intensity/complexity	4.43	4.11
Post-Service intensity/complexity		

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Valu Recommendations for the appropriate formula and format.*

The American College of Chest Physician's Practice Management Committee and the American Thoracic Society's Clinical Practice Committee reviewed the survey data and the practice expense inputs and are submitting their consensus documents for RUC review.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Typical Scenario for 2008 Reporting of Navigational Bronchoscopy

	CPT Code	Descriptor	Global Period	Work RVU	Pre/intra/post		
4.	31628	Bronchoscopy, rigid or flexible, with or without fluoroscopy; with transbronchial lung biopsy, single lobe	000	3.80	30/40/20=90		
5.	76499	Unlisted diagnostic radiographic procedure – for planning	NA	NA	NA		
6.	31899	Unlisted procedure of the trachea or bronchi – for navigation	NA	NA	NA		

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31899

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary Medicine How often? Sometimes

Specialty Thoracic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. surveyees provided percentage

Specialty Pulmonary Medicine Frequency 3600 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 400 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimated that the Medicare population is 50%.

Specialty Pulmonary Medicine Frequency 1800 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 200 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
ZZZ Global Period
Non-Facility Direct Inputs
-Facility (if staff paid by physician and not bill separately, ie. NP/PA) and

CPT Long Descriptor: Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with computer-assisted, image-guided navigation

Process used to develop your PE recommendation: The practice expenses were developed by the ACCP Practice Management Committee and the American Thoracic Society Clinical Practice Committee. There is good practice-type and geographical representation with the two pulmonary groups involved.

Please describe the clinical activities of your staff: **Intra-Service Period Clinical Staff Labor:**
Pre-Operative

- Navigation system is prepared. Room configuration is checked/verified
- Bronchoscope is prepped with local guide catheter and endoscopic tools are marked
- Sensors are attached to the patient and patient is positioned over location board
- System operation and patient position are checked

Navigation phase

- RN assists in moderate sedation or general anesthesia of patient, when performed in OR
- Assist physician during the procedure which includes handling the locator guide, bronchoscope and breathing tube
- Monitor and manage system operations with both remote and touch screen, toggle between targets per physician instruction

Post-Operative

- Assist in shut down of navigation system

PHYSICIAN ACTIVITES FOLLOW:
Planning Phase:
Pre-service part of intra-service physician work for the add-on code

- Previously acquired CT scan of the lungs is imported into the planning laptop with special software for performing navigational bronchoscopy.
- A three-dimensional image of the patient's lungs is generated by the planning software.
- The physician marks the anatomical points and target lesion(s) on the virtual and CT images.
- The virtual and CT images are used to plan the path that the guide catheter (extended working channel) and the steer able navigation catheter (locatable guide) will follow in the bronchial tree.
- The patient's virtual plan is saved and exported to a flash drive.

Navigation Phase – intra-service physician work

- The patient's virtual plan is downloaded into the computer.
- Moderate sedation is monitored.
- The bronchoscope is inserted.
- The guide catheter and steer able navigation catheter are inserted together (one inside the other) into the bronchoscope channel.
- CT images and steering directions on the monitor are used by the physician to navigate the guide catheter and steer able navigation catheter in real-time to target areas.
- The guide catheter is locked in place and the steer able navigation catheter is removed.
- Endobronchial tools are inserted through the guide catheter are used to collect tissue samples that are separately billed as a biopsy.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

October 2008

Tunneled Pleural Catheter

When the insertion of indwelling tunneled pleural catheter with cuff was initially developed, the majority of patients received this new procedure for symptomatic malignant pleural effusions as an end-of-life treatment. With increased usage of this catheter in malignant pleural effusions, it has become evident that the catheter can be removed in up to 70% of patients after successful resolution of the pleural effusion. Therefore the CPT Editorial Panel created a code to describe the removal of an indwelling pleural catheter with cuff to reflect this new practice pattern.

The RUC reviewed the specialty societies' survey data from 80 radiologists and thoracic surgeons for 32552 *Removal of indwelling tunneled pleural catheter with cuff.* The RUC compared the surveyed procedure to its reference code 36589 *Removal of tunneled central venous catheter, without subcutaneous port or pump* (Work RVU=2.27). Although the total service times of the surveyed code and the reference code are similar, 82 minutes and 79 minutes, respectively, the surveyed code is clearly a more intense procedure to perform. The specialty society explained and the RUC agreed that the surveyed code was a far more intense procedure to perform than the reference code for several reasons including: 1.) the surveyed procedure has 2-3 wound sites, whereas the reference procedure has 1 wound site, 2.) the surveyed procedure has a greater risk of pneumothorax as the catheter is going directly into the chest and 3.) due to the patient's cancer, the assessment of the patient is more extensive requiring a more extensive physical exam and a more extensive discussion with the patient and their family in comparison to the reference code. This difference between the surveyed code and the reference code is reflected in the survey data in the intensity complexity measures where the surveyed procedure has a greater level of intensity in all service time periods. Therefore, the RUC agrees with the specialty societies that the median work RVU of 2.50 RVUs for 32552 is appropriate as it maintains proper rank order with the reference code 36589. **The RUC recommends 2.50 RVUs for 32552.**

82

PLI Crosswalk:
The RUC established a new PLI crosswalk for 32552, its reference code 36589, as they determined this service would be more appropriate as it is closer in work RVUs to the proposed work for the surveyed code.

Practice Expense:
With the exception of a few minor changes to the pre-service time clinical labor inputs, the RUC agreed with the practice expense inputs recommended by the specialty societies.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
•32552	A1	Removal of indwelling tunneled pleural catheter with cuff	010	2.50

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 32552 Tracking Number A1 Specialty Society Recommended RVU: **2.50**

Global Period: 010 RUC Recommended RVU: **2.50**

CPT Descriptor: Removal of indwelling tunneled pleural catheter with cuff

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old woman with metastatic breast cancer undergoing chemotherapy had a tunneled pleural catheter inserted 8 weeks ago for a malignant pleural effusion. Patient records indicate that catheter drainage progressively slowed and ceased. Review of chest x-ray has demonstrated resolution of her effusion and re-expansion of the lung. She presents today for surgical removal of the catheter.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No Percent of survey respondents who stated it is typical in the Hospital/ASC setting? 43%

Is moderate sedation inherent to this procedure in the office setting? No Percent of survey respondents who stated it is typical in the office setting? 18%

Is moderate sedation inherent in your reference code (Office setting)? No

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: • Review patient history, medications and drainage history
- Review chest radiograph
- Review laboratory findings
- Answer patient and family questions
- Obtain informed consent
- Drain fluid if required
- Verify that all necessary surgical instruments and supplies are available in the operative suite
- Monitor patient positioning and draping, and assist with positioning as needed
- Scrub and gown

Description of Intra-Service Work: • Administer conscious sedation if patient is unduly anxious
- Infiltrate catheter exit site and cuff site with appropriate local anesthesia
- Make small incision around catheter exit site and if necessary cuff site
- Dissect around catheter and cuff site to loosen catheter from surrounding tissue
- Grasp and gently remove entire catheter from within the chest
- Confirm entire catheter is removed
- Suture exit site of catheter
- Apply dressings

Description of Post-Service Work: • Dictate operative note for patients chart
- Sign OR forms, indicating pre and post-op diagnoses, operation performed
- Write orders for post-op labs, films, medications, diet, and patient activity
- Discuss procedure outcome with patient and family
- Discuss procedure outcome with patient after emergence from anesthesia
- Write post-op report

- Carefully explain to patient and a family member dietary management, activities permitted, bathing, management of wound, return appointment to office, etc.
- Review post-discharge wound care and activity limitations with patient
- See patient back in the office to check wound, remove sutures, review chest radiograph and answer patient a family questions

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an 'WPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value ecommendations for the appropriate formula and format.*

The IWPUT for 32552 based on the specialty society recommendations is 0.052
The IWUPT of reference code 36589 is also 0.052
The IWPUT of the second reference code is 0.046

The societies feel that the recommended value and IWPUT are representative for this procedure. The overwhelming number of patients are cancer patients who previously would have been considered end of life. Initially it was thought that the catheter would never be removed. It is now obvious that in a number of the patients the pleural effusion resolv and the catheter is no longer needed. Therefore the catheter is removed prior to end of life. The patient population w has their tunneled pleural catheter removed will still need to be followed by the physician to ensure that fluid accumulation remains resolved and they are still being followed for their cancer. It is important to see the patient back at least once after the removal of the catheter with x-ray confirmation and exam followed by discussion with the patient to ensure that the fluid and dyspnea is resolved.
The societies feel that this procedure is more complicated than the reference service procedure as reflected by the RVU and the differences in work. The survey procedure has two or three wound sites as opposed to one and the catheter is going into the chest with risk of pneumothorax. Due to the patient's cancer, the assessment of the patient is more extensive requiring a more extensive physical exam, a more extensive discussion with the patient and their family, and looking at the chest x-rays.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiothoracic Surgery How often? Commonly

Specialty Interventional Radiology How often? Sometimes

Specialty Radiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 2402

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare frequency for 2006 for tunneled pleural catheter insertion is 2883, it is estimated that approximately 60 % of the total number of patients are Medicare patients, which results in an estimated total frequency of 4805. Of this number, it is estimated that 50% of the catheters are ultimately removed which esults in 2,402 catheters removed yearly.

Specialty Cardiothoracic surgery Frequency 1152 Percentage 47.96 %

Specialty Interventional Radiology Frequency 408 Percentage 16.98 %

Specialty Radiology Frequency 240 Percentage 9.99 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,441 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare frequency for 2006 for tunneled pleural catheter insertion is 2883, it is estimated that approximately 50% of the catheters are ultimately removed which results in 1,441 Medicare catheters removed yearly.

Specialty Cardiothoracic Surgery Frequency 691 Percentage 47.95 %

Specialty Interventional Radiology Frequency 230 Percentage 15.96 %

Specialty Radiology Frequency 144 Percentage 9.99 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
The Practice Expense Committee consisted of physician representatives from SIR, ACR and the STS.

'ease describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff fills out the pre-service diagnostic and referral forms. They call the hospital to schedule space and equipment needed in the facility and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. The clinical staff will educate the patient on what they need to do prior to the procedure including instructions to bring a bottle with them for pre-procedure drainage. The clinical staff will also call in any prescriptions necessary for the patient prior to the procedure as well as other offices and the patient to finalize the procedure.

Intra-Service Clinical Labor Activities:

Post-Service Clinical Labor Activities

Discharge day management

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
The PE committee consisted of physician representatives from SIR, ACR and the STS

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff will help with checking the patient in, putting them in the room and helping them gown if necessary. The clinical staff will provide pre-service education to the patient on what to expect for the procedure and obtain consent. They will prepare the room and set up the surgical tray and other necessary supplies and assist with positioning and administering the local anesthesia to the patient.

Intra-Service Clinical Labor Activities:

This is a sterile procedure therefore, once the clinical staff is gloved, they will remain in the room and assist the physician with the entire procedure.

Post-Service Clinical Labor Activities:

Once the procedure is completed the clinical staff will monitor the patient and help them get off the table and get dressed if necessary. They will check the dressing and provide the patient with information on how to care for their wound as well as activities they are allowed to participate in over the next several days. The clinical staff will also call in any prescriptions and coordinate follow-up care. The clinical staff will also clean the room and the surgical instruments used.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
April 2009

Chemical Pleurodesis

In February 2009, the CPT Editorial Panel created two new codes and revised one to describe the instillation of a fibrinolytic agent and provide further specificity to chemical pleurodesis. Chemical pleurodesis is the instillation of a chemical to get the visceral pleura of the lung to stick to the parietal pleura of the chest wall so the lung will not collapse. This revision to the definition allows the service to also be reported for fibrinolysis using a fibrinolytic agent. The revision to the descriptor also includes chemical instillation for fibrionlysis. The current code, 32560 *Chemical pleurodesis (eg, for recurrent or persistent pneumothorax)* (2009 Work RVU = 2.19) by definition is specific to chemical pleurodesis and does not include fibrinolysis or the instillation of chemicals other than those to obtain symphysis of the visceral and parietal pleural surfaces for situations such as malignant pleural effusions or pneumothorax. The instillation of the fibrinolytic chemical is similar to the instillation of a pleurodesis agent or talc, the only difference is the type of chemical that is instilled into the chest. Fibrinolytics are designed to break up debris or fibrin within the chest thus freeing up an entrapped lung.

98

32560 *Instillation, via chest tube/catheter, agent for pleurodesis (eg, talc for recurrent or persistent pneumothorax)*
The specialty recommended the survey 25th percentile, 2.00 work RVUs (lower than its current value in 2009 of 2.19 work RVUs), which the RUC agreed was too high. The RUC reviewed the recommended physician time for 32560, and after clarification from the specialty, it was agreed that pre-service time package 1A (Straightforward Patient/Procedure with No Sedation/Anesthesia) was appropriate however, because of the reviews of the chest radiograph and/or chest CT which is required given the location of the chest tube, status of lung inflation and potential presence of any residual fluid or air in the chest, the RUC agreed that an additional 5 minutes of pre-service evaluation time was required. The RUC also determined that the intra-service time as described by the specialty was best reflected with the surveyed median intra-service time, 20 minutes. After establishing the accurate service physician time (pre/intra/post=25/20/20), from the straightforward patient procedure without sedation/anesthesia pre-time standard and specialty survey, the RUC made comparisons to other codes with similar service times and intensities. These reference codes included 62311 *Injection, single (not via indwelling catheter), not including neurolytic substances, with or without contrast* (Work RVU=1.54 and pre/intra/post times= 35/20/15), 32421 *Thoracentesis, puncture of pleural cavity for aspiration, initial or subsequent* (Work RVU = 1.54, 000 day global, pre/intra/post times= 10/28/10) and 47525 *Change of percutaneous biliary drainage catheter* (Work RVU=1.54 and pre/intra/post times=25/20/10). **Based on these comparisons, the RUC recommends a work RVU of 1.54 for code 32560.**

32561 ***Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); initial day***

The specialty recommended the survey 25th percentile of 1.80 work RVUs, which the RUC agreed was too high. The RUC reviewed the recommended physician time for 32561 and determined that the intra-service time as described by the specialty was best reflected with the surveyed median intra-service time, 15 minutes. After establishing the accurate service physician time (pre/intra/post=20/15/10), from the straightforward patient procedure without sedation/anesthesia and specialty survey, the RUC determined that the intra-service work intensity for 32561 is the same as 32560. Therefore, the RUC agreed to use a building block approach to value 32561. The RUC used the intra-service work per unit of time from 32560, 0.0309, and as there is a five minute difference in intra-service physician time between 32561 and 32560, removed 0.15 RVUs (0.0309 x 5 minutes) from the recommended value for 32560. This calculation results in 1.39 RVUs. This retains the relativity of the survey medians for these two services as well. The RUC further validated this recommended RVU by comparing the surveyed code to 36580 *Replacement, complete, of a non-tunneled centrally inserted central venous catheter, without subcutaneous port or pump, through same venous access* (Work RVU=1.31 and pre/intra/post times=25/15/10), and 27096 (Work RVU = 1.40, 000 day global, pre/intra/post times= 10/25/5), and noted the similar intensities and service times. Based on these comparisons, **the RUC recommends a physician work relative value of 1.39 for CPT code 32561.**

99

32562 ***Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); subsequent day***

The specialty recommended the survey 25th percentile, 1.50 Work RVUs, which the RUC agreed was too high. The RUC reviewed the recommended physician time for 32562 and determined that the intra-service time as described by the specialty was best reflected with the surveyed median intra-service time of 10 minutes. After establishing the accurate service physician time (pre/intra/post=20/10/10), from the straightforward patient procedure without sedation/anesthesia pre-time package and specialty survey, the RUC determined that the intra-service work intensity for 32562 is the same as 32560. Therefore, the RUC agreed to use a building block approach to value 32562. The RUC used the IWPUT of 32560, 0.0309, and as there is a 10 minute difference in intra-service physician time between 32562 and 32560, removed 0.30 RVUs (0.0309 x 10 minutes) from the recommended value for 32560. This calculation results in 1.18 RVUs (1.54 – 0.30). This retains the relativity of the survey medians for these two services as well. The RUC further validated this recommended RVU by comparing the surveyed code to 67505 *Retrobulbar injection; alcohol* (Work RVU=1.27 and pre/intra/post times=25/10/5), 27096 (Work RVU = 1.40, 000 day global, pre/intra/post times= 10/25/5), and 36516 *Therapeutic apheresis; with extracorporeal selective adsorption or selective filtration and plasma reinfusion* (Work RVU = 1.22, 000 day global, pre/intra/post times = 25/15/10) and noted the similar intensities and service times. Based on these comparisons, **the RUC recommends a physician work relative value of 1.24 for CPT code 32562.**

Practice Expense
The RUC agreed that although these services are predominately performed in the inpatient facility setting, the services may be rarely performed in the non-facility setting. The RUC reviewed the direct practice expense inputs for the non-facility setting and recommended by the specialty society and made no edits other than adjust the assist physician time to be equal to 100% of the physician intra-service work time. The RUC agreed that there are no direct practice expense inputs in the facility setting for these services.

Work Neutrality
The RUC recommendations for this issue result in a work value savings to be redistributed via the conversion factor.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
The instillation of a fibrinolytic agent may be performed mutiple times per day over the course of several days. Code 32561 should be reported only once on the initial day of treatment. Code 32562 should be reported only once on each subsequent day of treatment			
▲ 32560	Instillation, via chest tube/catheter, ~~Cchemical~~ agent for pleurodesis (eg, talc for recurrent or persistent pneumothorax) (For chest tube insertion, use 32551)	000	1.54
●32561	Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); initial day (For chest tube insertion, use 32551)	000	1.39
●32562	subsequent day (For chest tube insertion, use 32551)	000	1.24

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:32560 Tracking Number U1 Specialty Society Recommended RVU: **2.00**

Global Period: 000 RUC Recommended RVU: **1.54**

CPT Descriptor: Instillation, via chest tube/catheter, agent for pleurodesis (eg, talc for recurrent or persistent pneumothorax)(For chest tube insertion, use 32551)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old man presents with shortness of breath. The patient has had two previous pneumothoraces and the present chest x-ray shows right pneumothorax, which was treated through a previously placed chest tube. Talc pleurodesis is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform a E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 53%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 73%

Is moderate sedation inherent in your reference code (Office setting)? Yes
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? Yes

Description of Pre-Service Work: The patient's medical record is reviewed and the chest radiograph and or chest CT is reviewed with special attention to the location of the chest tube, status of lung inflation and presence of any residual fluid or air in the chest. The status of the indwelling chest tube with regards to drainage and air leak is ascertained. The procedure is explained to the patient and informed consent is obtained. The drug is ordered from the pharmacy. Materials needed for the procedure are gathered at the patient's bedside.

Description of Intra-Service Work: The patient is positioned. The connection between the chest tube and drainage unit is prepped and draped in sterile fashion. Clamps are placed on either side of the connection and the tube is disconnected from the drainage hose. A syringe containing the chemical is inserted into the chest tube, the clamp is removed from the tube and the chemical is gently injected over several minutes into the thoracic cavity. The clamp is reapplied on the chest tube which is reconnected to the drainage unit. The patient is sequentially moved to each of six positions to distribute the chemical throughout the pleural cavity and the chemical is left to dwell in the chest cavity for typically about 30 minute Thereafter the clamp is removed and suction reinstituted.

Description of Post-Service Work: Pain is assessed and treated if present after pleurodesis. A chest radiograph is ordered and reviewed to ensure the lung is well inflated. A procedure report is either dictated or written into the medical record.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
32551	000	3.29	**RUC Time**

CPT Descriptor Tube thoracostomy, includes water seal (eg, for abscess, hemothorax, empyema), when performed (separate procedure)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
31622	000	2.78	**RUC Time**	92,211

CPT Descriptor 1 Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; diagnostic, with or without cell washing (separate procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
32421	000	1.54	**RUC Time**	124,935

CPT Descriptor 2 Thoracentesis, puncture of pleural cavity for aspiration, initial or subsequent

Other Reference CPT Code	Global	Work RVU	Time Source
31615	000	2.09	**Harvard Time**

CPT Descriptor Tracheobronchoscopy through established tracheostomy incision

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 7 **% of respondents:** 23.3 %

TIME ESTIMATES (Median)	CPT Code: 32560	Key Reference CPT Code: 32551	Source of Time RUC Time
Median Pre-Service Time	25.00	46.00	
Median Intra-Service Time	20.00	24.00	
Median Immediate Post-service Time	20.00	25.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**65.00**	**95.00**	

Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.88	3.75
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.75	3.63
Urgency of medical decision making	3.75	3.63

Technical Skill/Physical Effort (Mean)

Technical skill required	4.13	4.00
Physical effort required	4.00	4.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.88	3.75
Outcome depends on the skill and judgment of physician	3.75	3.63
Estimated risk of malpractice suit with poor outcome	4.13	4.00

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	2.00	4.00
Intra-Service intensity/complexity	3.75	3.63
Post-Service intensity/complexity	3.38	3.25

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Societies felt that the 25th percentile was more representative for the intraservice time and work values, therefore the STS/ACCP/ATS recommend an RVW of 2.0 with an intra-service time of 15 minutes for an IWPUT of 0.071

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32560

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiothoacic Surgery How often? Commonly

Specialty Pulmonary Disease How often? Commonly

Specialty General Surgery How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 9175
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. For Medicare, 6,423 procedures are done each year and Medicare accounts for approximately 70% of the procedures.

Specialty Cardiothoracic surgery Frequency 3762 Percentage 41.00 %

Specialty Pulmonary Disease Frequency 2491 Percentage 27.14 %

Specialty General Surgery Frequency 1452 Percentage 15.82 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,423 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty
Please explain the rationale for this estimate. based on current RUC database data

Specialty Cardiothoracic surgery Frequency 2633 Percentage 40.99 %

Specialty Pulmonary Disease	Frequency 1734	Percentage 26.99 %
Specialty General Surgery	Frequency 1091	Percentage 16.98 %

)o many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 32421

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:32561 Tracking Number U2 Specialty Society Recommended RVU: **1.80**

Global Period: 000 RUC Recommended RVU: **1.36**

CPT Descriptor: Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); initial day
(For chest tube insertion, use 32551)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 57-year-old diabetic woman presents with right lower lobe pneumonia and a complicated parapneumonic effusion, a chest tube was previously placed for drainage. A chest CT confirms several sizable loculations. Instillation of fibrinolysis through the existing chest tube is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform a E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 53%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 80%

Is moderate sedation inherent in your reference code (Office setting)? Yes
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? Yes

Description of Pre-Service Work: The patient's medical record is reviewed and the chest radiograph and or chest CT is reviewed with special attention to the location of the chest tube, status of lung inflation and presence of any residual fluid or air in the chest. The status of the indwelling chest tube with regards to drainage and air leak is ascertained. The procedure is explained to the patient and informed consent is obtained. The drug is ordered from the pharmacy. Materials needed for the procedure are gathered at the patient's bedside.

Description of Intra-Service Work: The patient is positioned. The connection between the chest tube and drainage unit is prepped and draped in sterile fashion. Clamps are placed on either side of the connection and the tube is disconnected from the drainage hose. A syringe containing the fibrinolytic agent is inserted into the chest tube, the clamp is removed from the tube and the fibrinolytic agent is injected into the thoracic cavity. The clamp is replaced on the chest tube which is reconnected to the drainage unit. The patient is sequentially moved to each of six positions to distribute the fibrinolyt agent throughout the pleural cavity for 2 hours. Thereafter the clamp is removed and suction reinstituted.

Description of Post-Service Work: A chest radiograph is ordered and reviewed to ensure the lung is well inflated. A procedure report is either dictated or written into the medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an RUVPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The specialties were asked to include the following questions in the survey to identify how often these procedures would be performed and what fibrinolytic agent is typically used for the procedures. The questions and responses are as follows (responses for the first three questions are based on the median survey value):

What is the typical number of fibrinolytic instillations performed on the initial day (3256X)?
Median – 1/day

What is the typical number of fibrinolytic instillations performed each subsequent day (3256X1)?
Median – 1/day

What is the typical number of days in a row that fibrinolytic instillations will be provided to a patient?
Median – 3 days

What is the typical agent used for fibrinolytic instillations (eg. streptokinease, tissue plasminogen activator-TPA, etc...)?
70% of respondents indicated that TPA was the typical agent

The Societies feel that the 25th Percentile is more representative of the work involved in the procedure and recommends that the 25th Percentile time and RVW be used for this code which results in an RVW of 1.80 and an intra time of 10 minutes, which results in an IWPUT of 0.121 for the procedure with pre-time package 1a.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) HCPCS code for alteplase - TPA (tissue plasminogen activator)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. J2997

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32560

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiothoacic Surgery How often? Commonly

Specialty Pulmonary Disease How often? Commonly

Specialty General Surgery How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 917
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The fibrinolytic procedures is estimated to add about 10% more cases to the pleurodesis procedure

Specialty Cardiothoracic surgery Frequency 375 Percentage 40.89 %

Specialty Pulmonary Disease Frequency 249 Percentage 27.15 %

Specialty General Surgery Frequency 145 Percentage 15.81 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 642
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. based on 10% of current RUC database data for pleurodesis

Specialty Cardiothoracic surgery Frequency 263 Percentage 40.96 %

Specialty Pulmonary Disease Frequency 174 Percentage 27.10 %

Specialty General Surgery Frequency 102 Percentage 15.88 %

CPT Descriptor Thoracentesis, puncture of pleural cavity for aspiration, initial or subsequent

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
31622	000	2.78	**RUC Time**	92,211

CPT Descriptor 1 Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; diagnostic, with or without cell washing (separate procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
32422	000	2.19	**RUC Time**	91,633

CPT Descriptor 2 Thoracentesis with insertion of tube, includes water seal (eg, for pneumothorax), when performed (separate procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
32551	000	3.29	**RUC Time**

CPT Descriptor Tube thoracostomy, includes water seal (eg, for abscess, hemothorax, empyema), when performed (separate procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 11 **% of respondents:** 36.6 %

TIME ESTIMATES (Median)	CPT Code: 32562	Key Reference CPT Code: 32421	Source of Time
Median Pre-Service Time	20.00	10.00	
Median Intra-Service Time	10.00	28.00	
Median Immediate Post-service Time	10.00	10.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Total Time	**40.00**	**48.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.18	3.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.91	2.36
Urgency of medical decision making	2.82	2.55

Technical Skill/Physical Effort (Mean)

Technical skill required	2.82	3.18
Physical effort required	2.73	3.09

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	2.91	3.00
Outcome depends on the skill and judgment of physician	2.91	2.91
Estimated risk of malpractice suit with poor outcome	3.09	2.91

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**

Time Segments (Mean)

Pre-Service intensity/complexity	2.82	2.82
Intra-Service intensity/complexity	2.36	2.82
Post-Service intensity/complexity	2.36	2.18

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an RVPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The specialties were asked to include the following questions in the survey to identify how often these procedures would be performed and what fibrinolytic agent is typically used for the procedures. The questions and responses are as follows (responses for the first three questions are based on the median survey value):

What is the typical number of fibrinolytic instillations performed on the initial day (3256X)?
Median – 1/day

What is the typical number of fibrinolytic instillations performed each subsequent day (3256X1)?
Median – 1/day

What is the typical number of days in a row that fibrinolytic instillations will be provided to a patient?
Median – 3 days

What is the typical agent used for fibrinolytic instillations (eg. streptokinease, tissue plasminogen activator-TPA, etc...)?
70% of respondents indicated that TPA was the typical agent

The Societies feel that the 25th Percentile is more representative of the work involved in the procedure and therefore recommend that an RVW of 1.50 and an intra time of 10 minutes be use which results in an IWPUT of 0.091 for the procedure with pre-time package 1a.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) HCPCS code for alteplase - TPA (tissue plasminogen activator)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. J2997

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32560

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiothoacic Surgery How often? Commonly

Specialty Pulmonary Disease How often? Commonly

Specialty General Surgery How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1834
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. the frequency would be double the initial code, one instillation per day after the initial for 2 days.

Specialty Cardiothoracic surgery Frequency 752 Percentage 41.00 %

Specialty Pulmonary Disease Frequency 498 Percentage 27.15 %

Specialty General Surgery Frequency 290 Percentage 15.81 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,284 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. he frequency would be double the initial code, one instillation per day after the initial for 2 days.

Specialty Cardiothoracic surgery Frequency 526 Percentage 40.96 %

Specialty Pulmonary Disease Frequency 349 Percentage 27.18 %

Specialty General Surgery Frequency 203 Percentage 15.80 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 96570

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

CPT Code:_____

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
000 Day Global Period
Non Facility Direct Inputs

CPT Long Descriptors:

32560 – Instillation, via chest tube/catheter, agent for pleurodesis (eg, talc for recurrent or persistent pneumothorax

32651 – Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); initial day

32652 – Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); subsequent day

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Crosswalk to existing code 32560 and expert panel review

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

32560 – The clinical staff will educate the patient on the procedure and obtain consent from the patient for the procedure

32651 – The clinical staff will educate the patient on the procedure and obtain consent from the patient for the procedure

32652 – The clinical staff will educate the patient on the procedure and obtain consent from the patient for the procedure

Intra-Service Clinical Labor Activities:

32560

During the intra-service time the clinical staff will greet the patient, provide gowning and obtain vital signs from the patient. They will prepare the room including laying out the supplies and preparing the necessary equipment. The clinical staff will assist with preparing and positioning the patient for the procedure. The procedure is typically performed with conscious sedation in the office so the staff will also set up the IV, help sedate the patient and help monitor the patient during the procedure.

The procedure is a sterile procedure so the clinical staff will assist the physician in instilling the talc and be sterilely gloved though the entire procedure.

Once the procedure is completed, the clinical staff will be responsible for monitoring the patient following the conscious sedation and will monitor the chest tube for drainage. The clinical staff will also clean the room and equipment once the procedure is completed.

32651

During the intra-service time the clinical staff will greet the patient and provide gowning and obtain vital signs from the patient. They will prepare the room including laying out the supplies and preparing the necessary equipment. The clinical staff will assist with preparing and positioning the patient for the procedure.

The procedure is a sterile procedure so the clinical staff will assist the physician in instilling the TPA and be sterilely gloved though the entire procedure.

Once the procedure is completed, the clinical staff will be responsible for monitoring chest tube for drainage. The clinical staff will also clean the room and equipment once the procedure is completed.

32652

During the intra-service time the clinical staff will greet the patient and provide gowning and obtain vital signs from the patient. They will prepare the room including laying out the supplies and preparing the necessary equipment. The clinical staff will assist with preparing and positioning the patient for the procedure.

The procedure is a sterile procedure so the clinical staff will assist the physician in instilling the TPA and be sterilely gloved though the entire procedure.

Once the procedure is completed, the clinical staff will be responsible for monitoring chest tube for drainage. The clinical staff will also clean the room and equipment once the procedure is completed.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

October 2008

Nikaidoh Procedure

The CPT Editorial Panel created two codes to describe a new repair technique applied to children suffering from transposition of the great arteries with ventricular septal defect and pulmonary stenosis.

33782
The RUC reviewed the specialty survey society data from 40 thoracic surgeons for 33782 *Aortic root translocation with ventricular septal defect and pulmonary stenosis repair (ie, Nikaidoh procedure); without coronary ostium reimplantation reconstruction.* The RUC noted that the reference code, 33413 *Replacement, aortic valve; by translocation of autologous pulmonary valve with allograft replacement of pulmonary valve (Ross procedure)* (Work RVU=59.74), selected by the survey respondents was very similar to the surveyed code. The reference code and the surveyed code have very similar intra-service times, 297 minutes and 300 minutes, respectively. The intensities for the surveyed code were slightly higher than the reference code, which the specialty society explained was due to the typical patient being a 14 month old child as opposed to the reference code which is performed on an adult. The RUC agreed that due to the very similar intra-service times and slightly higher intensities as compared to the reference code, 33782 is appropriately valued at 60.00 RVUs, the survey median. **The RUC recommends 60.00 RVUs for 33782.**

33783
The RUC reviewed the specialty society survey data from 40 thoracic surgeons for 33783 *Aortic root translocation with ventricular septal defect and pulmonary stenosis repair (ie, Nikaidoh procedure); with reimplantation of 1 or both coronary ostia.* The RUC noted that the reference code, 33413 *Replacement, aortic valve; by translocation of autologous pulmonary valve with allograft replacement of pulmonary valve (Ross procedure)* (Work RVU=59.74), selected by the survey respondents was less difficult to perform than the surveyed code. The reference code has significantly less intra-service time than the surveyed code, 297 minutes and 360 minutes, respectively. The intensities for the surveyed code were higher than the reference code, which the specialty society explained was due to the typical patient being a 12 month old child as opposed to the reference code which is performed on an adult. In addition, the surveyed code requires additional suture lines and physicians have to control has more bleeding as compared to the reference code. The RUC agreed that due to the higher intra-service times and higher intensities as compared to the reference code, 33783 is appropriately valued at 65.00 RVUs. **The RUC recommends 65.00 RVUs for 33783.**

PLI Crosswalk
The RUC agreed with the specialty society that 33413 is an appropriate PLI crosswalk for 33782 as they are similarly valued and performed by the same specialty. However, the RUC established a new PLI crosswalk for 33783, 33980 *Removal of ventricular assist device, implantable intracorporeal, single ventricle* (Work RVU=64.86) as they determined this service would be more appropriate as it is closer in work RVUs to the proposed work for the surveyed code.

Practice Expense:
The RUC recommends the standard 090 day global practice expense packages for these services as they are only performed in the facility setting.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
•33782	B1	Aortic root translocation with ventricular septal defect and pulmonary stenosis repair (ie, Nikaidoh procedure); without coronary ostium reimplantation reconstruction (Do not report 33782 in conjunction with 33412, 33413, 33608, 33681, 33770, 33771, 33778, 33780, 33920)	090	60.00
•33783	B2	with reimplantation of 1 or both coronary ostia	090	65.00

127

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33782 Tracking Number B1 Specialty Society Recommended RVU: **60.00**

Global Period: 090 RUC Recommended RVU: **60.00**

CPT Descriptor: Aortic root translocation with ventricular septal defect and pulmonary stenosis repair (ie, Nikaidoh procedure); without coronary ostium reimplantation

(Do not report 33782 in conjunction with 33412, 33413, 33608, 33681, 33770, 33771, 33778, 33780, 33920)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 14-month-old boy was born with mild cyanosis and a heart murmur. Echocardiography at birth revealed transposition of the great arteries (discordant ventricular-arterial connections) with ventricular septal defect and left ventricular outflow tract obstruction. The child's oxygen saturation on room air was 85% at birth and remained between 80% and 90% throughout the first 14 months of life. At age 14 months, the oxygen saturations began to fall to the 70% range and the child was referred for surgical intervention secondary to falling oxygen saturation levels.

At age 14 months, therefore, the child's clinical and echocardiographic data was reviewed at Joint Cardiology and Cardiac Surgery Conference and the decision was made to proceed with a Nikaidoh procedure (Aortic root translocation over left ventricle).

Percentage of Survey Respondents who found Vignette to be Typical: 76%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No Percent of survey respondents who stated it is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No Percent of survey respondents who stated it is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:
Write preoperatve orders, review pertinent clinical information. Talk with family and coordinate with facilty and other physicians. Wait for induction of anesthesia and insertion of lines. Position patient. Scrub and gown, prep and drape.

Description of Intra-Service Work: Under general endotracheal anesthesia, in the supine position, the patient is prepped and draped in standard aseptic fashion. Skin incision made via standard median sternotomy. Sternum is divided in the midline. Cardiac cannulae placed. Cardiopulmonary bypass initiated. Snares are snugged down on the caval cannulae allowing for complete heart bypass. The aorta is mobilized as are the proximal coronary arteries. With the heart still perfused, the aortic root is dissected off the right ventricle with the coronaries intact. The aorta is crossclamped and cold cardioplegic solution is injected into the aortic root. The ascending aorta is divided just below the crossclamp. The pulmonary artery is opened longitudinally with the incision carried down across the pulmonary annulus to the VSD thus creating unobstructed left ventricular outflow. Septal muscle is excised as necessary. The aortic root is now translocated

posteriorly with the back wall sewn to the remnant of the pulmonary valve annulus. A patch is used to close the VSD, which superiorly attaches to the anterior wall of the proximal aortic root thus providing unobstructed flow from the LV to the aorta. The pulmonary bifurcation is widely mobilized and brought anterior to the distal ascending aorta (the LeCompte maneuver). An end-to-end anastomosis is performed between the proximal ascending aorta and the dis' ascending aorta. Right ventricular to pulmonary artery continuity is established either with a valved conduit or attaching the posterior wall of the main pulmonary artery remnant to the right ventricle and roofing it with a non-valved patch. Air is evacuated from the cardiac chambers and the crossclamp is released. After satisfactory rewarming and resuscitation, the child is then weaned from cardiopulmonary bypass. The cannulae are removed and the sites secured. Chest tubes and temporary pacing wires are placed. The sternum is closed with wires, the abdominal fascia, skin and subcutaneous tissue closed in layers.

Description of Post-Service Work:
Apply dressing, insure patient stability. Dictate op note, write post-op orders. Discuss the procedure outcome with the family, nurses, and other physicians. Order labs and medications. Carefully monitor patient's in hospital progress and chart progress notes, answer nurse, staff, and family questions. Discharge patient, provide post-op wound care management, activity, dietary, and medication instructions.

Physical effort required	4.71	4.65

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.84	4.61
Outcome depends on the skill and judgment of physician	5.00	4.77
Estimated risk of malpractice suit with poor outcome	3.65	3.61

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	5.00	4.00
Intra-Service intensity/complexity	5.00	5.00
Post-Service intensity/complexity	4.00	4.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33413 and 33681 or 33413 and 33412 or 33771-22 if coronary artery buttons are re-implanted 33780

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 50
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Based on the number of cases reported in the STS database

Specialty cardiothoracic surgery Frequency 50 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is a congenital cardiac procedure, so it will rarely if ever be performed on Medicare Patients

Specialty cardiothoracic surgery Frequency 0 Percentage 0.00 %

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33783 Tracking Number B2 Specialty Society Recommended RVU: **65.00**

Global Period: 090 RUC Recommended RVU: **65.00**

CPT Descriptor: Aortic root translocation with ventricular septal defect and pulmonary stenosis repair (ie, Nikaidoh procedure); with reimplantation of 1 or both coronary ostia

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 12-month-old girl was born with mild cyanosis and a heart murmur. Echocardiography at birth revealed transposition of the great arteries (discordant ventricular-arterial connections) with ventricular septal defect and left ventricular outflow tract obstruction. The child's oxygen saturation on room air was 90% at birth and remained between 80% and 90% throughout the first year of life. At 12 months of age, the oxygen saturation started to fall to the 70% to 80% range. The child was referred for surgical intervention secondary to falling oxygen saturation levels.

The child's clinical and echocardiographic data was reviewed at Joint Cardiology and Cardiac Surgery Conference and the decision was made to proceed with a Nikaidoh procedure (Aortic root translocation over left ventricle). In the operating theatre, the surgeon identified a pattern of coronary artery branching necessitating individual transfer of the coronary arteries, with coronary artery button re-implantation after suitable coronary artery mobilization.

Percentage of Survey Respondents who found Vignette to be Typical: 76%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No Percent of survey respondents wl. stated it is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No Percent of survey respondents who stated it is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:
Write preoperatve orders, review pertinent clinical information. Talk with family and coordinate with facilty and other physicians. Wait for induction of anesthesia and insertion of lines. Position patient. Scrub and gown, prep and drape

Description of Intra-Service Work: Under general endotracheal anesthesia, in the supine position, the patient is prepped and draped in standard aseptic fashion. Skin incision made via standard median sternotomy. Sternum is divided in the midline. Cardiac cannulae placed. Cardiopulmonary bypass initiated. Snares are snugged down on the caval cannulae allowing for complete heart bypass. The aorta is mobilized as are the proximal coronary arteries. The aorta is crossclamped and cold cardioplegic solution is injected into the aortic root. The ascending aorta is divided just below the crossclamp. The coronary ostia are excised from the aortic root with an oval of aortic tissue and mobilized. The aortic root is dissected off the right ventricle. The pulmonary artery is opened longitudinally with the incision carried dov across the pulmonary annulus to the VSD thus creating unobstructed left ventricular outflow. Septal muscle is excised a necessary. The aortic root is now translocated posteriorly with the back wall sewn to the remnant of the pulmonary valve annulus. A patch is used to close the VSD which superiorly attaches to the anterior wall of the proximal aortic root thus providing unobstructed flow from the LV to the aorta. The previously excised coronary buttons are transferred back to the translocated aortic root either using the original coronary button harvest sites in the aortic root or creating new

defects for transfer and closing the original harvest sites. The pulmonary bifurcation is widely mobilized and brought anterior to the distal ascending aorta (the LeCompte maneuver). An end-to-end anastomosis is performed between the proximal ascending aorta and the distal ascending aorta. Right ventricular to pulmonary artery continuity is established either with a valved conduit or by attaching the posterior wall of the main pulmonary artery remnant to the right ventricle and roofing it with a non-valved patch. Air is evacuated from the cardiac chambers and the crossclamp is released. After satisfactory rewarming and resuscitation, the child is then weaned from cardiopulmonary bypass. The cannulae are removed and the sites secured. Chest tubes and temporary pacing wires are placed. The sternum is closed with wires, the abdominal fascia, skin and subcutaneous tissue closed in layers.

Description of Post-Service Work:
Apply dressing, insure patient stability. Dictate op note, write post-op orders. Discuss the procedure outcome with the family, nurses, and other physicians. Order labs and medications. Carefully monitor patient's in hospital progress and chart progress notes, answer nurse, staff, and family questions. Discharge patient, provide post-op wound care management, activity, dietary, and medication instructions.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The expert panel reviewed the data and felt that the 75th percentile was more representative of the differential of work for the coronary reimplantation than the 50th percentile and that this was not correctly represented in the data. The expert panel feels that this is primarily because physicians typically perform only one procedure or the other. In addition, the expert panel felt that the both 3377X1 and 3377X2 are more difficult procedures than the reference code, 33413. The 50th percentile for the 3377X1 represents this difference and the 75th percentile for 3377X2 represents this differece from

33413 and the additional work of coronary reimplantation. The 75th percentile was used for both the time and the work RVU for 3377X2.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
The Committee consists of congenital and adult cardiac surgeons from around the country.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff fills out the pre-service diagnostic and referral forms. They call the hospital to schedule space and equipment needed in the facility. They will also coordinate with anesthesia, the pediatric cardiologist, the OR, and the intensive care unit to ensure space. The clinical staff will educate the patient's parents on what they need to do to prepare the child for surgery prior to the procedure. The clinical staff will also help coordinate parental accommodations if necessary. The clinical staff will also call in any prescriptions necessary for the patient.

Intra-Service Clinical Labor Activities:

Post-Service Clinical Labor Activities

The clinical staff will help coordinate the discharge of the patient from the hospital.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Ventricular Assist Devices

In February 2009, the CPT Editorial Panel created three new codes to describe the replacement of ventricular assist devices (VAD). With the transition of VADs to longer term uses, it has become necessary to replace the VAD pump for mechanical failure or embolization. The three new codes describe the removal and replacement of intracorporeal and extracorporeal of VADs.

33981

The specialty society requested that code 33981 *Replacement of extracorporeal ventricular assist device, single or biventricular pump(s); single or each pump* be contractor priced. The specialty society determined that the work RVU from the survey results were not representative of the work involved in this procedure. The specialty society believes that the code and vignette are representative for the procedure, but that the survey respondents took extra work/factors outside the pump replacement descriptor for the code into account when valuing the procedure (such as cannula replacement). The specialty society determined that the procedure will be properly valued if it is surveyed with the entire family of codes. The specialty society plans to submit the rest of the family of VAD codes to CPT for review at the October 2009 meeting. **The RUC agrees with the specialty society and recommends that code 33981 be contractor priced.**

33982, 33983

The RUC reviewed codes 33982 *Replacement of ventricular assist device; implantable intracorporeal, single ventricle, without cardiopulmonary bypass* and 33983 *Replacement of ventricular assist device; implantable intracorporeal, single ventricle, with cardiopulmonary bypass* and had a thorough discussion regarding the specialty survey results for these two services. The RUC determined that the low performance rate of these services, low survey response rate and other typical methods of valuation (references codes/building block) rendered inappropriate work RVUs for these services. **Therefore, the RUC recommends that codes 33982 and 33983 be contractor priced.** The specialty society indicated that they intend to review the entire family of VAD codes to determine the next steps. The VAD replacement codes will be valued with the new VAD code family or as part of the 5-year review with identified VAD codes if appropriate.

93750

The RUC reviewed code 93750 *Interrogation of ventricular assist device (VAD), in person, with physician analysis of device parameters (eg, drivelines, alarms, power surges), review of device function (eg, flow and volume status, septum status, recovery), with programming, if performed, and report* and agreed with the specialty society that 93750 is comparable to reference service 95973, *Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex spinal cord, or peripheral (except cranial nerve) neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, each additional 30 minutes after first hour (List separately in addition to code for primary procedure)* (work RVU = 0.92). However, the RUC noted that the reference service is a ZZZ global, whereas the surveyed code is a XXX global. The survey respondents indicated that 93750 does not require any pre-service or post-service time, making it similar to a ZZZ global code. As such, the RUC determined that 93750 is very similar to the reference service 95973. In addition, the two codes require identical intra-service time of 30 minutes. Therefore, the RUC agreed that the physician work and time required to perform both services is identical. **The RUC recommends a physician work RVU of 0.92 for code 93750.**

Practice Expense

The RUC reviewed and approved the direct practice expense inputs for code 93750 as recommended by the specialty society.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
The insertion of a ventricular assist device (VAD) can be performed via percutaneous (0048T) or transthoracic (33975, 33976, 33979) approach. The location of the VAD may be intracorporeal or extracorporeal. Removal of a VAD (33977, 33978, 33980, 0050T) includes removal of the entire device, including the cannulas. Replacement of a VAD pump includes the removal of the pump and insertion of a new pump, connection, de-airing, and initiation of the new pump. Replacement of the entire device, i.e.pump(s) and cannulas, is reported using the insertion codes. Do not also report removal. (For percutaneous implantation of extracorporeal ventricular assist device or for removal of percutaneously implanted extracorporeal ventricular assist device, see Category III codes 0048T, 0050T. For replacement of a percutaneously placed extracorporeal ventricular assist device, use 33999)

March 31, 2009

Dear Dr. Rich,

Re: Recommendations for code 33981 - Replacement of extracorporeal ventricular assist device, single or biventricular pump(s); single or each pump

The STS would like to request that new code 33981 - be carrier priced for 2010. The Society feels that the value from the survey results is not representative of the work involved in this procedure.

The original code proposal that the STS developed was more comprehensive and included several additional codes. However, due to various reasons, the STS ended up separating out the 4 new codes from the rest of the proposal. The STS believes that the code and vignette are representative for the procedure, but that the members surveyed took extra work/factors outside the pump replacement descriptor for the code into account when valuing the procedure (such as cannula replacement). The STS feels that the procedure will be properly valued if it is surveyed with the entire family of codes. The STS plans to submit the rest of the family of VAD codes to CPT for review at the October meeting.

Sincerely,

Jim Levett, MD

STS/AATS RUC Advisor.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33981 Tracking Number V1 Specialty Society Recommended RVU: **CP**

Global Period: XXX RUC Recommended RVU: **CP**

CPT Descriptor: Replacement of extracorporeal ventricular assist device, single or biventricular pump(s); single or each pump

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old patient with life-limiting ventricular dysfunction presents with mechanical failure of his ventricular assist device. He is scheduled for device pump replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 70%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 100%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: Inflow and outflow cannulas are clamped, and the assist device pump is removed and inspected. A new ventricular assist device pump is physically connected to the inflow and outflow cannulas. The pump is primed and de-aired to prevent gas embolization. The device is activated to support the circulation, and its flow characteristics varied to ensure that adequate flow rates are achievable, and that there is unobstructed inflow and outflow. During the process of VAD initiation, the patient's intravascular volume and vasoactive drug therapy are adjusted to achieve satisfactory, stable cardiovascular function and end-organ perfusion.

Description of Post-Service Work:

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The STS would like to request that this code be carrier priced for 2010. The society feels that this value is not representative of the work involved in this procedure. This was originally part of a bigger code set and the STS feels that it would be more properly valued if we submit the rest of the family of codes to CPT and then value this code with the new family of codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review the surgical procedure including the pre-operative work-up, review of periopeative durgs, and prophylaxix against deep vein thrombosis/pulmonay embolism. Change into scrub clothes, check with lab on availability of blood and/or cross match, check that necessary surgical instruments, supplies,and devices are available in the OR. Coordinate care with the OR team, including anesthesia, nursing, physician assistants, and pump technicians, prepare for the need to go on cardiopulmonary bypass urgently if needed. Supervise setup of bypass equipment. Review planned procedure and positioning and draping of patient. Position patient, scrub and gown.

Description of Intra-Service Work: A reoperative median sternotomy is performed and the patient if fully anticoagulated. The implanted ventricular assist device is dissected free from surrounding scar tissue, avoiding injury to vital structures. The dissection is extended to permit ready access to the great vessels and the right heart for urgent cannulation to institute cardiopulmonary bypass should it be necessary. VAD flow rates are gradually reduced, and the patient carefully weaned from its assistance with adjustment of intravascular volume and inotropic agents. Inflow and outflow cannulas are clamped, and the assist device pump is removed and inspected. A new ventricular assist device is physically onnected to the inflow and outflow cannulas. The device is primed and de-aired to prevent gas embolization. The evice pump is activated to support the circulation, and its flow characteristics varied to ensure that adequate flow rates are achievable, and that there is unobstructed inflow and outflow. During the process of VAD initiation, the patients

Description of Post-Service Work: Apply dressing, manage postop medications, manage fluid and monitor ventilatory support and other non-cardica subsystems and use of blood products. Monitor for post op bleeding, heart failure, and

coagulopathic events. Discuss procedure outcome with patient family and other coordinating physicians. Write post-op orders and dictate report.

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review the surgical procedure including the pre-operative work-up, review of periopeative durgs, and prophylaxix against deep vein thrombosis/pulmonay embolism. Change into scrub clothes, check with lab on availability of blood and/or cross match, check that necessary surgical instruments, supplies,and devices are available in the OR. Coordinate care with the OR team, including anesthesia, nursing, physician assistants, and pump technicians. Supervise setup of bypass equipment. Review planned procedure and positioning and draping of patient. Position patient, scrub and gown.

Description of Intra-Service Work: A reoperative median sternotomy is performed and the patient if fully anticoagulated. The implanted ventricular assist device is dissected free from surrounding scar tissue, avoiding injury to vital structures. The dissection is extended to permit ready access to the great vessels and the right heart. The patient does not tolerate weaning from the VAD, and is therefore cannulated for cardiopulmonary bypass. This is initiated, the inflow and outflow VAD cannulas are clamped, and the assist device is removed and inspected. A new ventricular assist device pump is physically connected to the inflow and outflow cannulas. The pump is primed and de-aired to prevent gas embolization. The device is activated to support the circulation, and its flow characteristics varied to ensure that adequat flow rates are achievable, and that there is unobstructed inflow and outflow. During the process of VAD initiation, the patients intravascular volume and vasoactive drug therapy are adjusted to achieve satisfactory, stable cardiovascular function and end-organ perfusion. Hemostasis is achieved and the sternotomy closed over drains.

Description of Post-Service Work:

Apply dressing, manage postop medications, manage fluid and monitor ventilatory support and other non-cardica subsystems and use of blood products. Monitor for post op bleeding, heart failure, and coagulopathic events. Discuss procedure outcome with patient family and other coordinating physicians. Write post-op orders and dictate report.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 50
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty cardiothoracic surgery Frequency 50 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 50
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty cardiothoracic surgery Frequency 50 Percentage 100.00 %

pecialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93750 Tracking Number V4 Specialty Society Recommended RVU: **1.75**

Global Period: XXX RUC Recommended RVU: **0.92**

CPT Descriptor: Interrogation of ventricular assist device (VAD), in person, with physician analysis of device parameters (eg, drivelines, alarms, power surges), review of device function (eg, flow and volume status, septum status, recovery), with programming, if performed, and report
(Do not report 93750 in conjunction with 33975, 33976, 33979, 33981-33983)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old patient is seen for regular, scheduled ventricular assist device follow-up assessment (E/M reported separately). The VAD is interrogated.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 65%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 80%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: The physician disconnects the patient from their battery and attaches the outflow conduit to a cable which in turn is connected to a non-portable VAD Systems Monitor which downloads information from the patient's VAD and performs a series of diagnostic checks (i.e., VAD stroke rate, flow volume, pump rate, alarm history) to ensure the VAD is functioning within specified parameters. This real-time data is compared to recorded data to determine functioning as well as patient compliance with VAD operating instructions when the patient is engaged in activities of daily living.

Description of Post-Service Work:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99233	XXX	2.00	**RUC Time**

CPT Descriptor Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99478	XXX	2.75	**RUC Time**	10

CPT Descriptor 1 Subsequent intensive care, per day, for the evaluation and management of the recovering very low birth weight infant (present body weight less than 1500 grams)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99204	XXX	2.30	**RUC Time**	3,254,499

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
93289	XXX	0.78	**RUC Time**

CPT Descriptor Interrogation device evaluation (in person) with physician analysis, review and report, includes connection, recording and disconnection per patient encounter; single, dual, or multiple lead implantable cardioverter-defibrillator system, including analysis of heart rhythm derived data elements

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 9 **% of respondents:** 45.0 %

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The cardiothoracic surgeon and the cardiologists both follow the patient after VAD insertion. The typical pattern of care for a patient after discharge from the hospital in the outpatient setting for the first year post VAD insertion is as follows:

1st month – the patient is seen weekly for evaluation and VAD device interrogation and programming

2nd month – the patient is seen every other week for evaluation and VAD device interrogation and programming

Months 3 - 12 – the patient is seen monthly for evaluation and VAD device interrogation and programming

---

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) This procedure will be reported with an E/M service on the same day. The level and type of evaluation will vary by patient

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Rarely

Specialty cardiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 10000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty cardiothoraic surgery Frequency 5000 Percentage 50.00 %

Specialty cardiology Frequency 5000 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,984 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. here are 500,000 heart failure patients each year. Of that number approximately 374 will receive a long-term VAD device (based on current RUC database numbers). For the patients who receive a long term VAD device, the typical patient will be seen for 16 visits during the year (see additional rationale below for typical patient visit pattern).

Specialty cardiothoraic surgery Frequency 2992 Percentage 50.00 %

Specialty cardiology Frequency 2992 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 93289 is a more appropriate crosswalk

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor:
93750 - Interrogation of ventricular assist device (VAD), in person, with physician analysis of device parameters (eg, drivelines, alarms, power surges), review of device function (eg, flow and volume status, septum status, recovery), with programming, if performed, and report

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

There is no pre-service clinical labor associated with this procedure. The clinical staff time for these activities would be captured under the E/M code which is reported separately

Intra-Service Clinical Labor Activities:
The clinical staff will prepare the equipment and the room for the interrogation and then will assist the physician with a portion of the interrogation procedure as necessary. The clinical staff will then clean the equipment and the room at the conclusion of the procedure.

Post-Service Clinical Labor Activities:

There is no post-service clinical labor associated with this procedure.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Pharyngeal Wall Resection with Flap

The CPT Editorial Panel at the February 2009 Meeting revised code 42894 *Resection of pharyngeal wall requiring closure with myocutaneous or fasciocutaneous flap, or free muscle, skin or fascial flap with microvascular anastamosis* to include identification of fasciocutaneus flaps as well as pedicled flaps and use of microvascular anastomosis and requested that the parenthetic note be reconciled with the language in the listed codes to direct the user to the appropriate codes. The RUC reviewed the current service description of 42894 as it contains the sentence: "The flap is sewn to the pharyngeal defect using interrupted sutures in two layers" to ensure there is no overlap in work between 42894 and the flap repair service. The RUC determined that there is no overlap in work between 42894 and the flap repair services (15732, 17534, 15757 or 15758) and indicated that these flap repair service should be reported separately as indicated in the parenthetical. **The RUC recommends that the aforementioned sentence be removed from the intra-service description for code 42894.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommen-dation
▲42894	Y1	Resection of pharyngeal wall requiring closure with myocutaneous or fasciocutaneous flap, or free muscle, skin or fascial flap with microvascular anastamosis (For flap used for reconstruction, see codes 15732, 15734, 15756, 15757, or 15758)	090	33.61 (No Change)

RE: CPT Minutes February 2009 Meeting: Tab 20 Pharyngeal Wall Resection With Flap, proposed Editorial Change

Tab 20: Pharyngeal Wall Resection With Flap

This issue was presented by Joseph Leonard, MD and Richard Waguespack, MD of the American Academy of Otolaryngology- Head and Neck Surgery.

The Panel accepted Option B of this request to *editorially* revise code 42894 to include identification of fasciocutaneus flaps as well as pedicled flaps and use of microvascular anastomosis. The Panel requested that the parenthetic note be reconciled with the language in the listed codes to direct the user to the appropriate codes. The RUC will be asked to review the current service description as it contains the sentence: "The flap is sewn to the pharyngeal defect using interrupted sutures in two layers." This work is part of the flap repair service.

▲42894 Resection of pharyngeal wall requiring closure with myocutaneous or fasciocutaneous flap or free muscle, skin or fascial flap ~~pedicled or~~ with microvascular anastamosis

(For flap used for reconstruction, ~~report~~ see codes 15732, 15734, 15756, 15757, or 15758)

Staff Note: After Panel review, Richard W. Waguespack, MD responded that 15757 was to remain in the instructional parenthetical. To reflect this information, the descriptor was revised to include a free skin flap to correlate with the listed flap codes.

It is the opinion of the American Academy of Otolaryngology- Head and Neck Surgery (AAOHNS) that there is no overlapping work between the just-revised resection code 42894 (CPT Editorial Panel's February 2009 meeting) and the series of flap closure codes with which it is to be reported. The change only specifies, and expands beyond myocutaneous, the types of currently-utilized and extensive flaps with which the resection is reconstructed. The existing intraservice work in the RUC database, reviewed in 2005, is as follows:

After tracheotomy is complete, a separate incision is outlined at level of the mid potion of the thyroid ala, curving posteriorly to the mastoid tip. A lazy "S" inferior extension is used if necessary. This incision is carried through the skin, subcutaneous tissues and platysma

muscle. Flaps are raised in the subplatysmal plane up to the mandible (care must also be taken to avoid injuring the marginal mandibular nerve along this dissection plane), down to the clavicle and back to the trapezius muscle. Care is taken not to connect this incision with the tracheotomy incision. [If necessary, a separately reportable ipsilateral neck dissection is completed including removal of the sternomastoid muscle.] The lip is split in the midline creating a Z-Plasty at the labiomental crease. The cheek flap is elevated back to the mental foramen. The first bicuspid tooth is removed. The mandibular periosteum is elevated on the inner and outer surface. A mandibular reconstruction plate is coapted to the mandible prior to osteotomy. The plate is then affixed to the mandible with transosteal screws. [Typically two separate plates are used for tooth-bearing mandibles; one larger plate and one tension band.] The plates and screws are then removed and set aside for use in closing the mandibulotomy. The mandible is divided using an oscillating saw. The lateral floor of mouth mucosa and the mylohyoid muscle are divided allowing the mandible to swing laterally. The submandibular gland is removed if not done previously. The position of the tumor, hypoglossal nerve and superior laryngeal nerve are confirmed. The blood supply to the tumor including facial vein, lingual and ascending pharyngeal arteries are ligated and divided as needed. With the tumor in direct view, the anterior pharyngeal and tongue base cuts are completed making sure to obtain an adequate tumor margin. While protecting the ascending carotid artery, the remaining cuts are completed, being careful to allow adequate margins of resection around the cancer. Frozen section margins are harvested. Orient resected specimen for the pathologist. Wound is irrigated and hemostasis assured while awaiting histologic assessment of margins. Review results of frozen section with the pathologist. Further resection of any involved margins is completed. Fresh surgical instruments are obtained. The surgeon changes gown and gloves to avoid contamination of the flap donor site with oral secretions or tumor. [Harvesting of a flap for reconstruction is performed as a separately reported procedure.] <u>The flap is sewn to the pharyngeal defect using interrupted sutures in two layers.</u> The neck wounds are copiously irrigated. The floor of mouth incisions are repaired. The mandibular reconstruction plate is fixed in position. The lip is reapproximated in two layers using a complex plastic closure of the vermillion border. A small caliber nasogastric feeding tube is placed. Closed suction drains are placed laterally in the wound and the wounds are closed using absorbable sutures for the platysma and staples for the skin. The endotracheal tube placed through the tracheotomy is exchanged for a cuffed tracheotomy tube and secured.

The reconstructive flap code **15732** intraservice work descriptor states the flap goes into an *intraoral* defect and no additional closure is needed. With the code we are revising (42894), closure of the defect associated with *pharyngeal* resection is not just suturing the flap into place. There are additional layers of tissue including lip, floor of mouth, skin, subcutaneous tissue, and mandibulotomy to be closed which are included in the resection code, not the flap code. Since 42894 was reviewed by the RUC in 2005 and 15732 is a myocutaneous flap (existing language for both codes) which can be used for a number of area reconstructions, any overlap of work between the resection and flap codes would be inconsequential and have been taken into consideration during the 2005 RUC deliberations.

15734 does not have a description of closure of or attachment to the resection site.

Also, intraservice work descriptors of **15756, 15757**, and **15758** do say, "The flap is then harvested, transferred to the recipient bed, *and loosely sewn in place*." This "loose sewing" is necessary to stabilize the flap for the microvascular anastomosis and does not constitute the final definitive operative site closure.

Thus, it is the AAOHNS's opinion that the changes to 42894 are strictly editorial and do not require survey of this code or any of those flap codes used for reconstruction. Thank you for your consideration and we remain,

Respectfully,

Joseph Leonard, MD
CPT Advisor, AAOHNS

Richard Waguespack, MD
Chair, CPT & Relative Value CMTE, AAOHNS

ADDENDA

Intraservice 15732 ***Muscle, myocutaneous, or fasciocutaneous flap; head and neck (eg, temporalis, masseter muscle, sternocleidomastoid, levator scapulae):*** After the ablative part of the procedure has been completed, appropriate measurements of the defect are obtained and planning for the size of the flap is done. An incision is made over the ipsilateral temporalis muscle. Dissection is carried down to the temporal fascia, which is opened widely and the appropriate amount of muscle dissected from the temporal fossa. This muscle is then isolated on the deep temporal artery and its accompanying vein and the surrounding anatomic relationships assessed. A tunnel is created deep to the zygomatic arch with care not to disturb existing intact arteries and nerves. This tunnel is opened into the oral cavity and enlarged to accommodate the muscle flap. The flap is transposed and the vascular pedicle re-assessed. The flap is inset into the ***palatal*** defect and sutured in place. Because of its anatomic setting, no dressings are appropriate.

Intraservice 15734 ***Muscle, myocutaneous, or fasciocutaneous flap; trunk:*** After the ablative part of the procedure has been completed, appropriate measurements of the defect are obtained and planning for the size of the flap is done. An incision is made over the ipsilateral latissimus muscle. Dissection is carried down to the fascia, which is elevated off the muscle. The anterior and posterior borders of the muscle are exposed and the dissection continues inferiorly until enough length is obtained to reach the defect. The inferior portion of the muscle is then divided and the muscle elevated off the chest wall and isolated on the thoracodorsal vascular pedicle. A tunnel is created subcutaneously to reach the defect and enlarged to accommodate the muscle flap. The flap is transposed and the vascular pedicle re-assessed.

The flap is inset into the chest wall defect and sutured in place after placement of a closed suction drain. The donor site is closed primarily over suction drains. A split-thickness skin graft is harvested from the ipsilateral thigh, meshed and secured to the muscle. A bolster dressing is applied over the skin graft. The skin graft donor site is covered with an occlusive dressing.
Intraservice 15756 ***Free muscle or myocutaneous flap with microvascular anastomosis:*** The latissimus dorsi muscle without skin is harvested through a long posterolateral incision. If a muscle flap with skin is required, a skin paddle is outlined over the latissimus dorsi and the dissection is carried down to the latissimus dorsi muscle, taking care to attach the skin paddle to the latissimus dorsi fascia. Meticulous dissection is carried out to free the latissimus from the surrounding soft tissues and underlying muscles and chest wall. Once the pedicle is identified, microdissection to the vascular pedicle is completed. The flap is then harvested, **transferred to the recipient bed, and loosely sewn in place**. The operating microscope is then used to perform the microanastomosis of one artery and one or two veins using 9-0 or 10-0 suture. Attention to detail is critical at this juncture of the procedure, as even micro-injury to the vessels will lead to failure of the flap. The insetting of the flap is then meticulously completed. A drain is placed beneath the flap. Meticulous hemostasis of the donor site is achieved and the wound closed in layers of drains. A bulky dressing is applied to the recipient site and reinforced with plaster splint.

Intraservice 15757 ***Muscle Free skin flap with microvascular anastomosis:*** The skin flap is outlined on the posterolateral aspect of the thorax. The dissection is carried down the fascial layer of the underlying muscles. The flap is then elevated, taking care to protect the vascular supply to the flap. Once the pedicle is identified, microdissection of the vascular pedicle is completed. The flap is then harvested, **transferred to the recipient bed, and loosely sewn in place**. The operating microscope is then used to perform the microanastomosis of one artery and one or two veins using 9-0 or 10-0 suture. Attention to detail is critical at this juncture of the procedure, as even micro-injury to the vessels will lead to failure of the flap. Drains are placed beneath the flap and the insetting of the flap is then meticulously completed. The donor site wound is closed in layers over drains and dressed. A bulky dressing is applied to the recipient site and reinforced with a plastic splint."

Intraservice 15758 ***Free fascial flap with microvascular anastomosis:*** An incision is made alone the lateral aspect of the arm and the subcutaneous tissue is carefully dissected down to the fascia. The fascia is then elevated off of the adjacent muscle down to the lateral intramuscular septum where the vessels are identified. Branches of the radial nerve are identified. The radial nerve is protected. The vascular pedicle is then carefully identified using microsurgical technique. Great care must be taken during the microvascular dissection so as to not injure the vessels. The flap is then harvested and **transferred to the recipient bed and loosely sewn in position.** Attention to detail is critical at this juncture of the procedure, as even micro-injury to the vessels will lead to failure of the flap. The microanastomoses using the operating microscope of one artery and one or two veins is then carried out using 9-0 or 10-0 suture. The insetting of the flap is then meticulously completed. The donor site wound is closed in layers over the drains and sterile dressings are applied. A bulky dressing is applied to the recipient site and reinforced with plaster splint.

CPT Code	Descriptor	2005 work RVU	RUC Rec Work RVU	Comment from the Public	RUC Rationale	Change in Time from 2005?	Action Key
42892	Revision of pharyngeal walls	15.81	23.09	AHNS commented that the RVUs for the pharyngectomy procedures are Harvard-based and have never been reviewed by the RUC. AHNS believes that many other RUC reviewed procedures with similar time and visit patterns have significantly higher work RVUs and higher IWPUT values than the pharyngectomy codes.	The RUC agreed with the specialty's contention that there is compelling evidence that the previous Harvard evaluation mechanism or methodology was flawed. The original Harvard data is based on twelve otolaryngologists. Pre- and post-service data were not surveyed and this code was not part of the Harvard Phase 4 refinement. There was a lack of effort to compare work with intra-specialties or other specialties. Additionally, the patient population as also changed since 1995. Many patients today are either not candidates for chemo-radiation therapy because of advanced disease or have failed chemo-radiation therapy. The RUC recommends a work RVU of 23.09 above the median value do to size of the lesion and pharyngeal walls involved in this procedure. The RUC recommends the median survey times for code 42892. This procedure is typically performed with codes 38720, 38724, & 31600.	☑	1
42894	Revision of pharyngeal walls	22.85	30.00	AHNS commented that the RVUs for the pharyngectomy procedures are Harvard-based and have never been reviewed by the RUC. AHNS believes that many other RUC reviewed procedures with similar time and visit patterns have significantly higher work RVUs and higher IWPUT values than the pharyngectomy codes.	The RUC agreed that there is compelling evidence that the previous evaluation mechanism or methodology was flawed. The original Harvard data is based on twelve otolaryngologists. Pre- and post-service data were not surveyed and this code was not part of the Harvard Phase 4 refinement. There was a lack of effort to compare work with intra-specialties or other specialties. Additionally, the patient population as also changed since 1995. Many patients today are either not candidates for chemo-radiation therapy because of advanced disease or have failed chemo-radiation therapy. The RUC recommends the survey median work RVU of 30.00 and the median survey times for code 42894. This procedure is typically performed with codes 38720, 38724, 31600, 15734, & 43246.	☑	1

Action Key (1 = Adopt the recommended increase in the work RVU; 2 = Maintain the current work RVU; 3 = Adopt the recommended decrease in the work RVU; 4 = Suggest a new RVU; 5 = Refer the code to CPT; 6 = No consensus; 7 = Accept withdrawal by commenter, without prejudice; 8 = No Level of Interest submitted, no Recommendation submitted)

CPT Descriptor: Resection of pharyngeal wall requiring closure with myocutaneous flap

this SOR does not conform to ours & they modified it

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Resection of pharyngeal wall requiring closure with myocutaneous flap

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Is conscious sedation inherent to this procedure? No Percent of survey respondents who stated it is typical? 0%

Is conscious sedation inherent in your reference code? No

Description of Pre-Service Work:
- Write preadmission orders for preoperative medications
- Review medical history, endoscopy, pathology and radiology reports
- Review results of preadmission testing (lab, EKG, chest x-ray)
- Meet with patient and family to review planned procedure and post-operative management
- Reexamine patient to make sure that physical findings have not changed and update H&P
- Obtain informed consent
- Review airway and medical management with anesthesiologist
- Verify that all required instruments and supplies are available
- Change into scrub clothes
- Monitor/assist with positioning of patient - with placement of a transverse shoulder roll to provide neck extension.
- Make sure anesthesia monitoring equipment will not interfere with draping
- Review radiographic images on view box and review planned incisions and procedure – including reconstruction and dental continuity/integrity for planned mandibulotomy
- Outline areas of skin to be prepped and mark surgical incisions
- Scrub and gown
- Monitor/assist with prepping and draping – with care to protect the eyes
- Assist anesthesiologist in endotracheal intubation
- Perform surgical "time out" with operating surgical team

Description of Intra-Service Work: After tracheotomy is complete, a separate incision is outlined at level of the mid potion of the thyroid ala, curving posteriorly to the mastoid tip. A lazy "S" inferior extension is used if necessary. This incision is carried through the skin, subcutaneous tissues and platysma muscle. Flaps are raised in the subplatysmal plane up to the mandible (care must also be taken to avoid injuring the marginal mandibular nerve along this dissection plane), down to the clavicle and back to the trapezius muscle. Care is taken not to connect this incision with the tracheotomy incision. [If necessary, a separately reportable ipsilateral neck dissection is completed including removal of the sternomastoid muscle.] The lip is split in the midline creating a Z-Plasty at the labiomental crease. The cheek flap is elevated back to the mental foramen. The first bicuspid tooth is removed. The mandibular periosteum is elevated on the inner and outer surface. A mandibular reconstruction plate is coapted to the mandible prior to osteotomy. The plate is then affixed to the mandible with transosteal screws. [Typically two separate plates are used for tooth-bearing mandibles; one larger plate and one tension band.] The plates and screws are then removed and set aside for use in closing the mandibulotomy. The mandible is divided using an oscillating saw. The lateral floor of mouth mucosa and the mylohyoid muscle are divided allowing the mandible to swing laterally. The submandibular gland is removed if not done previously. The position of the tumor, hypoglossal nerve and superior laryngeal nerve are confirmed. The blood supply to the tumor including facial vein, lingual and ascending pharyngeal arteries are ligated and divided as needed. With the tumor in direct view, the anterior pharyngeal and tongue base cuts are completed making sure to obtain an adequate tumor margin. While protecting the ascending carotid artery, the remaining cuts are completed, being careful

to allow adequate margins of resection around the cancer. Frozen section margins are harvested. Orient resected specimen for the pathologist. Wound is irrigated and hemostasis assured while awaiting histologic assessment of margins. Review results of frozen section with the pathologist. Further resection of any involved margins is completed. Fresh surgical instruments are obtained. The surgeon changes gown and gloves to avoid contamination of the flap dor site with oral secretions or tumor. [Harvesting of a flap for reconstruction is performed as a separately repor procedure.] The flap is sewn to the pharyngeal defect using interrupted sutures in two layers. The neck wounds are copiously irrigated. The floor of mouth incisions are repaired. The mandibular reconstruction plate is fixed in position. The lip is reapproximated in two layers using a complex plastic closure of the vermillion border. A small caliber nasogastric feeding tube is placed. Closed suction drains are placed laterally in the wound and the wounds are closed using absorbable sutures for the platysma and staples for the skin. The endotracheal tube placed through the tracheotomy is exchanged for a cuffed tracheotomy tube and secured.

Description of Post-Service Work: Post-service Hospital Work

- Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Check postoperative chest x-ray to confirm adequate placement of nasogastric feeding tube. Review immediate postoperative care with PACU/ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Write postoperative note. Dictate operative report and copy the referring physician.
- Write orders for postoperative medications, diet, and patient activity
- Check wounds and monitor patient progress. Chart notes. Review patient management with nursing staff
- Check postoperative laboratory examination, including hematocrit and electrolytes, and adjust fluid replacement as indicated.
- Advance tube feedings as tolerated.
- Monitor closed suction drainage
- Tracheotomy tube is changed to uncuffed metal tube on when appropriate. [Trach tube is removed when patient can tolerate plugging of uncuffed metal tube]
- Manage dressings and monitor status of incision for signs of infection or fistula.
- Monitor pulmonary status by physical examination, periodic chest x-ray, if indicated, and by observing f postoperative fever or leukocytosis.
- Assure adequate level of pain control
- Discuss case with speech therapist
- Refer to physical therapist for shoulder rehab
- Review results of pathologic examination of surgical specimen and convey information to patient and family.
- Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy
- Write prescriptions for medications and supplies needed post-discharge.
- Home restrictions (ie, diet, activity, bathing) are discussed with the patient and family members.
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-service Office Work

- If trach tube not removed prior to discharge, examine site at dressing change. If trach removed prior to discharge, monitor healing of incision at site.
- Examine patient, remove sutures and staples
- Answer patient/family questions
- Order and review progress of speech and swallowing rehabilitation.
- Monitor diet caloric intake, arrange dietitian consultation if needed,
- Remove nasogastric feeding tube when patient is taking adequate oral intake.
- Post discharge labs/films are ordered and reviewed - begin routine surveillance for recurrent tumor
- Discuss the need for postoperative radiation with patient
- Arrange for postoperative radiation therapy consultation as needed. Discuss case with radiation oncologist and prepare documents for transmission to that office.
- Discuss dental consult
- Monitor healing of pharynx with indirect laryngoscopy or flexible fiberoptic laryngoscopy
- Monitor for malocclusion of dentition from the mandibulotomy, as well as possible mandibular nonunion
- Dictate progress notes for medical chart

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 38720, 38724, 31600, 15734 & 43246

Five-Year Review Specific Questions:

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%):

Has the work of performing this service changed in the past 5 years? Yes 38% No 62%

(Use the subset of the people who responded "Yes" to answer the following questions)

A. This service represents new technology that has become more familiar (i.e., less work):
   I agree 3% I do not agree 97%
B. Patients requiring this service are now:
   more complex (more work) 93% less complex (less work) 0% no change 7%
C. The usual site-of-service has changed:
   from outpatient to inpatient 0% from inpatient to outpatient 0% no change 100%

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Laparoscopic Paraesophageal Hernia Repair

In February 2009, the Society of American Gastrointestinal and Endoscopic Surgeons (SAGES) requested to defer RUC review of this issue until April 2009 after the CPT Editorial Panel clarifies SAGES' October 2008 request to develop two new codes instead of one code to describe laparoscopic paraesophageal hernia repair. The CPT Editorial Panel reviewed this issue at its February 2009 meeting and created two new codes to describe the laparoscopic approach to repair of paraesophageal and diaphragmatic hernias with and without implantation of mesh.

43281

The RUC reviewed code 43281 *Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh* and compared it to key reference service 43279 *Laparoscopy, surgical, esophagomyotomy (Heller type), with fundoplasty, when performed* (work RVU = 22.00, 80 minutes pre-time, 150 minutes intra-time and 30 minutes immediate post-time). The RUC reviewed the pre-service time and agreed with the specialty society that pre-service time package 4 – Facility Difficult patient/difficult procedure with some modifications was appropriate. The RUC agreed that an additional 12 minutes of positioning time was appropriate (15 minutes total positioning time) to reposition the patient from supine to modified lithotomy position after anesthesia is induced as well as adjust the operating room table and anesthesia lines so that the operative site is assessable for laparoscopic equipment/monitors, surgeon and assistants to visualize and perform the operation. The RUC also agreed to remove 5 minutes of scrub/dress/wait time (15 minutes total scrub/dress/wait time) as this was the median indicated by the survey respondents. The RUC determined that the intra-service time of 180 minutes and immediate post-service time of 30 minutes appropriately accounts for the physician time required to perform this service.

The RUC reviewed the survey intensity and complexity measures required for 43281 compared to key reference service 43279 and determined that 43281 is slightly more intense and complex. The specialty society indicated and the RUC agreed that the survey median work RVU of 26.50 appropriately accounts for the work required to perform this service. To provide additional support for this work RVU the specialty society indicated that code 43644 *Laparoscopy, surgical, gastric restrictive procedure; with gastric bypass and Roux-en-Y gastroenterostomy (roux limb 150 cm or less)* (work RVU = 29.24) was also cited by the survey respondents as a reference service. The intensity required to perform 43644 is similar to code 43281, further 43644 has the same intra-service time

but more post-operative work. If the additional 99232 visit and difference in office visits are subtracted the work RVUs for 43281 and 43644 is similar, 26.50 versus 26.85 respectively.

29.24 RVU for 43644
-1.39 one less 99232
-1.00 difference in office visit RVUs (2x99213 versus 1 each 99214, 99213, 99212
26.85

The RUC recommends the survey median work RVU of 26.50 for code 43281.

43282
The RUC reviewed code 43282 *Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; with implantation of mesh* and compared it to key reference service 43644 *Laparoscopy, surgical, gastric restrictive procedure; with gastric bypass and Roux-en-Y gastroenterostomy (roux limb 150 cm or less)* (work RVU = 29.24, 75 minutes pre-time, 180 minutes intra-time and 30 minutes immediate post-time). The RUC reviewed the pre-service time and agreed with the specialty society that pre-service time package 4 - Facility Difficult patient/difficult procedure with some modifications was appropriate. The RUC agreed that an additional 12 minutes of positioning time was appropriate (15 minutes total positioning time) to reposition the patient from supine to modified lithotomy position after anesthesia is induced as well as adjust the operating room table and anesthesia lines so that the operative site is assessable for laparoscopic equipment/monitors, surgeon and assistants to visualize and perform the operation. The RUC also agreed to remove 5 minutes of scrub/dress/wait time (15 minutes total scrub/dress/wait time) as this was the median indicated by the survey respondents. The RUC determined that the intra-service time of 210 minutes and immediate post-service time of 30 minutes appropriately accounts for the physician time required to perform this service. Code 43282 requires an additional 30 minutes of intra-service time compared to key reference service 43644 and other upper GI laparoscopic bariatric procedures to account for the additional time to dissect and remove the sac, consider important components of adequate repair, working high into the mediastinum along the esophagus in front of the aorta and in close proximity to the pleura and to sew the mesh.

The RUC reviewed the survey intensity and complexity measures required for 43282 compared to key reference service 43644 and determined that 43282 is slightly more intense and complex. The specialty society indicated and the RUC agreed that the survey median work RVU of 30.00 appropriately accounts for the work required to perform this service. Additionally, this recommendation, which is 3.50 work RVUs greater than 43281, accounts for the increased intra-operative time for mesh placement) and increased intensity for this more complex procedure. **The RUC recommends the survey median work RVU of 30.00 for 43282.**

New Technology
The RUC discussed how to ensure that 43281 and 43282 is not reported when repair of esophageal sliding hernia is performed. The specialty society indicated that they will address and provide correct coding education via a CPT Assistant article as well as the American College of Surgeons bulletin. The RUC recommends that codes 43281 and 43282 be placed on the new technology list to solely review the volume of these services in a couple years to ensure appropriate reporting..

Practice Expense
The RUC recommends the standard 090-day global direct practice expense inputs for 43281 and 43282.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
43280		*Laparoscopy, surgical, esophagogastric fundoplasty (eg, Nissen, Toupet procedures)*	090	18.00 (No Change)
●43281	Z1	Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh	090	26.50
●43282	Z2	with implantation of mesh (For transthoracic paraesophageal hernia repair, see 39520. For transabdominal paraesophageal hernia repair, see 39502) (Do not report 43281, 43282 in conjunction with 43280, 43450, 43453, 43456, 43458, 49568)	090	30.00

SUMMARY OF RECOMMENDATION

CPT Code:43281 Tracking Number Z1 Specialty Society Recommended RVU: **26.50**

Global Period: 090 RUC Recommended RVU: **26.50**

CPT Descriptor: Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old woman presents with dysphagia, reflux, and intermittent chest pain. A work-up including upper GI series, endoscopy, and CT scan of the chest and abdomen demonstrates a Type III paraesophageal hernia with greater than 50% of the stomach present in the chest. She undergoes laparoscopic repair without implantation of mesh

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 13% , Admitted (more than 24 hours) 87%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform a E&M service later on the same day 91%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Assure appropriate selection, timing, and administration of DVT prophylaxis. Determine indication for intra-operative antibiotics and prescribe as necessary. Assess need for beta-blockers, order as required. Review preadmission work-up, with particular attention to imaging information and reports and pulmonary and cardiac co-morbidities. Reexamine patient to make sure that physical findings have not changed, and update H&P. Review results of preadmission testing (lab, EKG, chest x-ray, availability of blood products). Meet with patient and family to review planned procedure and post-operative management. Discuss the possibility of mesh implantation to reinforce the hiatal repair. Review and obtain informed consent, including witness. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic equipment. Perform team checklist verification (anesthesia, OR staff, house staff). Assist in transfer of patient from gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. Monitor/assist with positioning of patient. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under general anesthesia, surgical laparoscopy is performed. Pneumoperitoneum is established to distend the abdomen, and the laparoscope is introduced. Gas flow and intra-abdominal pressure are carefully monitored so as not to impair ventilation or venous return. Four to six trocar ports are sited through the anterior abdominal wall above the umbilicus. The viscera are inspected. An orogastric tube may be placed to

decompress the stomach if it will pass. The liver is retracted to allow visualization of the esophageal hiatus. The stomach is gently retracted into the abdomen to assess its degree of tethering in the thorax. The peritoneum overlying the right crus is incised and the plane along the hernia sac is developed. The dissection is extended anteriorly and laterally to the left crus. The base of the crural confluence is dissected free of adhesions to the sac. The hernia sac is carefully dissected into the mediastinum with caudal traction. The interfaces between the pleura, pericardium, spine and aorta are developed as the dissection is carried cephalad to the top of the hernia sac. The sac contents are completely reduced back into the abdominal cavity. The hernia sac is then excised taking care to avoid injury to stomach and vagal trunks. An esophageal dilator may be placed transorally. The esophagus is identified and dissected circumferentially and along its mediastinal course in order to reduce tension, allowing the gastroesophageal junction to rest comfortably within the abdominal cavity. Care is taken to identify and preserve the vagus nerves. The gastro-splenic ligament and the short gastric vessels are divided if necessary. The retro-esophageal window is developed and the esophagus is retracted caudally. The crural pillars are then approximated with sutures. Anterior reinforcement of the diaphragm is performed with sutures as needed, the tightness of the repair being gauged visually or by the presence of the bougie or other device. Partial or total fundoplasty is then performed with sutures. Additional sutures may be placed to attach the gastric fundus and/or body to the diaphragm. The operative field is carefully inspected to ensure hemostasis. Esophageal tubes are removed as per surgeon preference. The liver retractor and then trocars are removed. The wounds are closed.

Description of Post-Service Work:
Hospital:
Apply sterile adhesive strips and dressings. Monitor patient during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia and anti-emetics. Instruct nursing staff in care of tubes and other devices. Review post-operative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart and record. Dictate operative report and copy referring physician(s). Discontinue perioperative antibiotic therapy as appropriate. Write orders for transferring to general surgical floor and discuss ongoing care with floor nurses. Order x-rays (e.g. barium esophagram) as per routine Examine patient, including reviewing vital signs and respiratory status and confirming as necessary. Auscultate heart and lungs Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection. Continue prophylaxis for DVT. Monitor daily for adequacy. Assess need for beta-blockers, order as required. Monitor and document patient progress. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status and renal function. Review nursing/other staff patient chart notes. Write orders for labs, x-rays, medications, diet, and patient activity. Chart patient progress notes, daily. Review available x-rays (if ordered) Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. liquid, mechanical soft or regular diets and their duration) Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is return of bowel function, adequate nutritional intake, and pain is controlled with oral analgesics. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office:
Talk with and examine patient and assess ease of swallowing. Assess pulmonary function. Remove dressings, sutures, when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination Discuss advancement of diet with slow introduction of solid foods. Monitor dietary caloric intake by weight. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician(s) (verbal and written). Dictate/type progress notes for medical chart.

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.71	3.59
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.00	3.88
Urgency of medical decision making	3.65	3.41

Technical Skill/Physical Effort (Mean)

Technical skill required	4.47	4.29
Physical effort required	3.88	3.59

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.06	4.00
Outcome depends on the skill and judgment of physician	4.35	4.24
Estimated risk of malpractice suit with poor outcome	3.94	3.71

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.88	3.88
Intra-Service intensity/complexity	4.24	4.06
Post-Service intensity/complexity	3.06	3.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Comparison to key reference code: 43279 *Laparoscopy, surgical, esophagomyotomy (Heller type), with fundoplasty, when performed*

New code 43281 *Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh* has become widely used with long term follow-up. The existing code structure reflects an abdominal

via laparotomy approach and a thoracic via thoracotomy approach, but not the laparoscopic approach which we believe represent the majority of procedures for this condition. Patients undergoing this procedure are usually elderly and very commonly have cardiac and respiratory co-morbidities, are on anti-platelet agents or anti-coagulation, and require arterial lines and careful anesthetic monitoring. In comparison to the key reference code, pre- and post-work would be nearly dentical. Intra-operative time is 30 minutes greater for new code 43281.

Pre-Time: With respect to the pre-service time, we recommend package 4 (difficult patient / difficult procedure) with the following modifications:

- Evaluation: no change (40 min)
- Positioning: Add 13 minutes (total = 15 min). After induction of anesthesia in supine position, the patient is repositioned in modified lithotomy and the OR table and anesthesia lines are adjusted so that the operative site is assessable for laparoscopic equipment/monitors, surgeon and assistants to visualize and perform the operation. This total time of 15 minutes is less than what the consensus group believes to be representative of laparoscopic operations, however, this is the survey median.
- Scrub/Dress/Wait: Subtract 5 minutes (total = 15 min). Although pre-time package includes 20 minutes for this component of pre-time, the survey median is 15 minutes.

RVW Recommendation: The survey intensity and complexity measures for the survey code are slightly greater than the reference code. Additionally, the survey data indicate the new code will require 30 minutes more intra-operative time. **The consensus committee reviewing the survey data recommends an RVW of 26.50, which is the survey median RVU.** This results in an IWPUT that is slightly greater than the reference code – accounting for the increased intensity and complexity of this operation.

Additional support: Code 43644 was also sited as a reference by survey respondents. The intensity of this procedure is similar to new code 43281. This procedure has the same intra-op time but more post-op work. If you subtract the difference in post-op work, the result is 26.85 which is similar to the recommended value of 26.50.

'9.24	RVW for 43644
-1.39	1 less 99232
-1.00	difference in office visit RVWs (2x99213 versus 1 each 99214, 99213, 99212)
26.85	

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
43289 Unlisted laparoscopy procedure, esophagus
43280-22 Laparoscopy, surgical, esophagogastric fundoplasty (eg, Nissen, Toupet procedures)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Sometimes

Specialty thoracic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Specialty estimate.

Specialty general surgery Frequency 3600 Percentage 90.00 %

Specialty thoracic surgery Frequency 400 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,200 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Specialty estimate of percentage of all patients that will undergo laparoscopic repair without mesh.

Specialty general surgery Frequency 1100 Percentage 91.66 %

Specialty thoracic surgery Frequency 100 Percentage 8.33 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 44204 Laparoscopy, surgical; colectomy, partial, with anastomosis. This laparoscopic code has the same intra-op time (180 min) and similar RVW (26.29)

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Assure appropriate selection, timing, and administration of DVT prophylaxis. Determine indication for intra-operative antibiotics and prescribe as necessary. Assess need for beta-blockers, order as required. Review preadmission work-up, with particular attention to imaging information and reports and pulmonary and cardiac co-morbidities. Reexamine patient to make sure that physical findings have not changed, and update H&P. Review results of preadmission testing (lab, EKG, chest x-ray, availability of blood products). Meet with patient and family to review planned procedure and post-operative management. Discuss the possibility of mesh implantation to reinforce the hiatal repair. Review and obtain informed consent, including witness. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic equipment. Perform team checklist verification (anesthesia, OR staff, house staff). Assist in transfer of patient from gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. Monitor/assist with positioning of patient. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under general anesthesia, surgical laparoscopy is performed. Pneumoperitoneum is established to distend the abdomen, and the laparoscope is introduced. Gas flow and intra-abdominal pressure are carefully monitored so as not to impair ventilation or venous return. Four to six trocar ports are sited through the anterior abdominal wall above the umbilicus. The viscera are inspected. An orogastric tube may be placed to decompress the stomach if it will pass. The liver is retracted to allow visualization of the esophageal hiatus. The

stomach is gently retracted into the abdomen to assess its degree of tethering in the thorax. The peritoneum overlying the right crus is incised and the plane along the hernia sac is developed. The dissection is extended anteriorly and laterally to the left crus. The base of the crural confluence is dissected free of adhesions to the sac. The hernia sac is carefully dissected into the mediastinum with caudal traction. The interfaces between the pleura, pericardium, spine and aorta a developed as the dissection is carried cephalad to the top of the hernia sac. The sac contents are completely reduc back into the abdominal cavity. The hernia sac is then excised taking care to avoid injury to stomach and vagal trunks. An esophageal dilator may be placed transorally. The esophagus is identified and dissected circumferentially and along its mediastinal course in order to reduce tension, allowing the gastroesophageal junction to rest comfortably within the abdominal cavity. Care is taken to identify and preserve the vagus nerves. The gastro-splenic ligament and the short gastric vessels are divided if necessary. The retro-esophageal window is developed and the esophagus is retracted caudally. If possible the crural pillars are approximated with sutures. Anterior reinforcement of the diaphragm is performed with sutures as needed, the tightness of the repair being gauged visually or by the presence of the bougie or other device. Determine if mesh reinforcement of the repair is necessary. A relaxing incision may be created in the diaphragm. A suitably sized, shaped and trimmed piece of synthetic or biologic mesh prosthesis is introduced into the abdomen, positioned appropriately in the hiatal region and fixed with stitches, tacks, staples or other devices. Partial or total fundoplasty is then performed with sutures. Additional sutures may be placed to attach the gastric fundus and/or body to the diaphragm. The operative field is carefully inspected to ensure hemostasis. Esophageal tubes are removed as per surgeon preference. The liver retractor and then trocars are removed. The wounds are closed.

Description of Post-Service Work:
Hospital:
Apply sterile adhesive strips and dressings. Monitor patient during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia and anti-emetics. Instruct nursing staff in care of tubes and other devices. Review post-operative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note, including the Catalogue and Lot number of the implanted mesh, and place in chart and record. Dictate operative report and copy referring physician(s). Discontinue perioperative antibiotic therapy : appropriate. Write orders for transferring to general surgical floor and discuss ongoing care with floor nurses. Order x-rays (e.g. barium esophagram) as per routine. Examine patient, including reviewing vital signs and respiratory status and confirming as necessary. Auscultate heart and lungs. Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection. Continue prophylaxis for DVT. Monitor daily for adequacy. Assess need for beta-blockers, order as required. Monitor and document patient progress. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status and renal function. Review nursing/other staff patient chart notes. Write orders for labs, x-rays, medications, diet, and patient activity. Chart patient progress notes, daily. Review available x-rays (if ordered). Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. liquid, mechanical soft or regular diets and their duration). Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is return of bowel function, adequate nutritional intake, and pain is controlled with oral analgesics. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office:
Talk with and examine patient and assess ease of swallowing. Assess pulmonary function. Remove dressings, sutures, when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination Discuss advancement of diet with slow introduction of solid foods. Monitor dietary caloric intake by weight. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician(s) (verbal and written). Dictate/type progress notes for medical chart.

SURVEY DATA

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Comparison to key reference code: 43644 Laparoscopy, *surgical, gastric restrictive procedure; with gastric bypass and Roux-en-Y gastroenterostomy (roux limb 150 cm or less)*

New code 432X2 *Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; with implantation of mesh* has become widely used with long term follow-up. The existing code structure reflects an abdominal

via laparotomy approach and a thoracic via thoracotomy approach, but not the laparoscopic approach which we believe represent the majority of procedures for this condition. Patients undergoing this procedure are usually elderly and very commonly have cardiac and respiratory co-morbidities, are on anti-platelet agents or anti-coagulation, and require arterial lines and careful anesthetic monitoring. New code 43282 has similar intensity, but requires more intra-op time compared to the upper GI laparoscopic bariatric procedures. This includes dissection and removal of the sac, considered important components of adequate repair, requires working high into the mediastinum along the esophagus, just in front of the aorta and in close proximity to the pleura. Post-operative work is slightly greater for morbidly obese patients undergoing 43644 compared to code 43282.

Pre-Time: With respect to the pre-service time, we recommend package 4 (difficult patient / difficult procedure) with the following modifications:

- Evaluation: no change (40 min)
- Positioning: Add 13 minutes (total = 15 min). After induction of anesthesia in supine position, the patient is repositioned in modified lithotomy and the OR table and anesthesia lines are adjusted so that the operative site is assessable for laparoscopic equipment/monitors, surgeon and assistants to visualize and perform the operation. This total time of 15 minutes is less than what the consensus group believes to be representative of laparoscopic operations, however, this is the survey median.
- Scrub/Dress/Wait: Subtract 5 minutes (total = 15 min). Although pre-time package includes 20 minutes for this component of pre-time, the survey median is 15 minutes.

RVW Recommendation: The survey intensity and complexity measures for the survey code are slightly greater than the reference code. **The consensus committee reviewing the survey data recommends an RVW of 30.00, which is the survey median RVU.** This results in an IWPUT that is almost identical to the key reference code – accounting for the similar intensity and complexity of this operation and the differences in intra-time and post-op work. Additionally, this recommendation, which is 3.50 RVUs greater than 43281, accounts for the increased intra-operative time (for mesh placement) and increased intensity for this more complex procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
43289 Unlisted laparoscopy procedure, esophagus

43280-22 Laparoscopy, surgical, esophagogastric fundoplasty (eg, Nissen, Toupet procedures)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Sometimes

Specialty thoracic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Specialty estimate.

Sample Size: **N/A**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus committee of general surgeons and thoracic surgeons agree that these procedures would not be performed in an office setting and would not typically be emergent.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The clinical staff completes pre-service diagnostic and referral forms. They call the facility to schedule space and equipment needed and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. Clinical staff will provide and review educational materials and information including instructions on diet and changes to medications prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carrier out. Calls may also be necessary to coordinate changes in polypharmacy with the PCP prior to the procedure.

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities
Discharge management and office visits related activities are performed.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Endoscopic Pancreatoscopy

The CPT Executive Committee considered a request from the American College of Gastroenterology, the American Gastroenterological Association and the American Society of Gastrointestinal Endoscopy to revise the parenthetical following code 43273 to include code 43262 to the list of codes appropriately reported in addition to code 43273 *Endoscopic cannulation of papilla with direct visualization of common bile duct(s) and/or pancreatic duct(s) (List separately in addition to code(s) for primary procedure).*

The CPT Executive Committee questioned how the RUC considered sphincterotomy services and the frequency that sphincterotomy would be required for scope placement and therefore voted to reject the appeal and uphold the current position of the Panel pending determination by the RUC that sphincterotomy is not included in 43273. The RUC reviewed the background of the issue beginning with the addition of the code to CPT in February 2008 and discovered that the modifications to the parentheticals were changed by the CPT Editorial Panel after the survey initiation date. Therefore, the specialties developing recommendations for this code used the original parenthetical which included 43262 in their survey instrument. The RUC reviewed this service at its April 2008 meeting with 43262 included in the parenthetical and as a code listed in the summary of recommendation form as being a primary code for the add-on code. **Given this information, the RUC recommends that 43262 be added to the parenthetical following the descriptor for 43273 and that the intra-service description of work be modified as described below:**

> **After informed consent is obtained, the patient is brought to the therapeutic endoscopy suite. Sedation is administered intravenously, and the duodenoscope is introduced through the mouth with inspection of the esophagus, stomach and duodenum. Selective cannulation of the bile duct is obtained followed by multiple views of the cholangiogram under fluoroscopy. A guidewire is passed such that the tip is in the proximal biliary tree, and a standard biliary sphincterotomy is performed, which is reported separately.**
>
> **The cholangioscope is passed through the duodenoscope and into the biliary tree. Direct visualization is performed with careful inspection of the biliary and pancreatic epithelium. The mass lesion is identified and multiple biopsies are taken. The right and left intrahepatic biliary tree, common hepatic duct and common bile duct are all viewed. The cholangioscope is then withdrawn and then passed into the pancreatic duct. At**

the conclusion of the procedure, the cholangioscope is withdrawn and the physician proceeds with the remainder of the ERCP procedure.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommen-dation

Chicago IL 60654

RE: CPT Executive Committee query regarding parenthetical for CPT code 43273

Dear Dr. Rich:

On behalf of the American Gastroenterological Association (AGA) and the American Society for Gastrointestinal Endoscopy (ASGE) we are pleased to provide the following comments in response to a request from the CPT Editorial Panel regarding:

- code + 43273, *Endoscopic cannulation of papilla with direct visualization of common bile duct(s) and/or pancreatic duct(s)*
  (List separately in addition to code(s) for primary procedure)
  (Use 43273 in conjunction with 43260, 43261, 43263-43265, 43267-43272)

At the February 2009 meeting, the CPT Editorial Panel and the CPT Executive Committee requested further information from our societies regarding the frequency that sphincterotomy would be required for scope placement in response to our request that the Panel revise the parenthetical following code 43273 to include code 43262 (*Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy / papillotomy*) to the list of codes appropriately reported in addition to code 43273. We appreciate the opportunity to provide additional guidance as the Panel and the RUC consider this request.

Code 43273, which describes an add-on service to ERCP procedures, was valued at the April 2008 RUC meeting, based on recommendations from our societies which utilized survey data obtained in the usual manner. The CPT Executive Committee's question is whether, in valuing 43273, the RUC included the work of sphincterotomy (code 43262) as part of the physician work. This question, in turn, hinges on whether the survey respondents included sphincterotomy work as part of their responses. We believe there is compelling evidence to indicate that they did not, and that the survey responses reflect the work of cholangioscopy / pancreatoscopy alone, without sphincterotomy.

Table 1 at the end of this letter provides the complete text which was presented to survey respondents who completed the questionnaires used to generate the data presented in April 2008. It will be observed that the word "sphincterotomy" does not appear anywhere in this text; moreover, no part of the work description suggests that such work is to be included in the procedure being surveyed. In addition, it will be noted that the CPT Code Descriptor specifically instructs respondents that 432XX is to be used in conjunction with the sphincterotomy code, 43262. It would certainly be difficult to imagine that the

respondents would have included the sphincterotomy work element in their valuation of the code given these instructions and this clinical vignette.

Second, there are good data to indicate that more often than not a sphincterotomy has already been performed in such patients in an earlier ERCP procedure prior to the cholangioscopy/pancreatoscopy. Table 2 shows data recently presented in a peer reviewed forum (Chen et al., 2008) regarding patients who have undergone cholangioscopy. In this series of 297 subjects, 77% (229/297) had already undergone sphincterotomy during an ERCP procedure prior to the cholangioscopy. Of note, of those patients who did undergo a sphincterotomy during the procedure in which the cholangioscopy was performed, the sphincterotomy was unrelated to the cholangioscopy procedure in 59% (39/66) of patients. This is in keeping with the clinical scenario we have reported to the CPT Executive Committee.

In addition, the comment that a sphincterotomy is often performed during the ERCP procedure and is therefore unrelated to the cholangioscopy is supported by Medicare claims data. Table 3 shows a subgroup analysis from 37,789 ERCP procedures in 2007 for three specific codes which are associated with diseases for which cholangioscopy or pancreatoscopy are indicated. These data show that ERCP patients require sphincterotomy in over 50% of the time that ERCP procedures are reported. These findings are directional in that they suggest that sphincterotomy will not always be directly related to cholangioscopy. Hence, data exist from two independent sources supporting the conclusion that a sphincterotomy is NOT uniformly performed as part of cholangioscopy and that in the majority of cases, sphincterotomy, when provided, is unrelated to the cholangioscopy / pancreatoscopy. The survey respondents, being experienced with this fact, would not be expected to include the work of sphincterotomy in their responses.

In summary, we feel confident that the data presented to the RUC in April 2008 which formed the basis for the valuation of code 43273 did not include the work of sphincterotomy, code 43262, and that the RUC did not, either intentionally or accidentally, include this work in their valuation. We therefore recommend that the RUC advise the CPT Executive Committee that sphincterotomy is not included in the work of cholangioscopy/pancreatoscopy, code 43273 and we do not recommend an RVU change; the parenthetical which proscribes the concurrent use of code 43262 with 43273 should be amended to allow the concurrent use of the two codes, and the phrase "(separately reported)" should be inserted into the intra-service work description.

Thank you for the opportunity to submit this recommendation.

Sincerely,

Joel V. Brill, MD AGAF

Committee

Table 1: Text of 43273 survey instrument

Survey element	Survey text
CPT Code Descriptor (emphasis added)	Endoscopic cannulation of papilla with direct visualization of common bile duct(s) and/or pancreatic duct(s) (List separately in addition to code(s) for primary procedure) **(Use 432XX in conjunction with** 43260, 43261, **43262**, 43264, 43265, 43267, 43268, 43269, 43271, and 43272)
Typical Patient/Service	A 60-year old male presents with severe epigastric pain with radiation to the back. An abdominal ultrasound shows a normal gallbladder without stones and normal gallbladder wall thickness. An abdominal CT scan reveals a markedly dilated pancreatic duct at 1cm in diameter and a normal biliary tree. An ERCP reveals an enlarged ampulla of Vater with a markedly dilated opening and mucin in the orifice. Pancreatoscopy is performed to evaluate a presumed intraductal papillary mucinous neoplasm.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2008

Cholangioscopy-Pancreatoscopy

The clinical efficacy of cholangioscopy/pancreatoscopy is well established in the diagnosis and treatment of pancreaticobiliary disease. The CPT Editorial Panel met in February 2008 and agreed that the current endoscopic retrograde cholangiopancreatography (ERCP) codes do not adequately describe a cholangioscopy / pancreatoscopy procedure, which is a distinct and substantially different procedure from ERCP. The cholangioscopy / pancreatoscopy procedure is additive to a variety of ERCP procedures and ERCP codes are inadequate to describe this procedure. The Editorial Panel created CPT code 43273 *Endoscopic cannulation of papilla with direct visualization of common bile duct(s) and/or pancreatic duct(s) (List separately in addition to code(s) for primary procedure)* to accurately report and describe the work associated with this complex procedure. It is estimated that 5-10% of all ERCPs will require this new service 43273.

223

The RUC reviewed the survey results from 55 practicing gastroenterologists for newly created add-code 43273. The survey respondents reported physician time in the pre and post period. As physician work is typically not performed in the pre and post period for an add-on code, the specialty concluded this was the result of the survey respondents' lack of familiarity with the concept of pre/intra/post time and the survey instrument for an add-on code. The societies concluded it would be appropriate to remove the pre- and post- time and back-out the associated work relative values from the survey median (3.25) to calculate their recommended work value of 2.24. The RUC calculated the work relative value for 43273 by taking the survey median 3.25 – ((25 minutes pre-service time x .0224) + (20 minutes post-service time x .0224)) = 2.24. The value of 2.24 work RVUs lies between the survey median (3.25) and the 25th percentile (2.00).

The RUC compared 43273 to the specialty survey's key reference service code 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* (work RVU = 2.39) and agreed that new service 43273 was similar; however, it is much more intense and requires more skill than code 43235. The RUC also questioned the intra-service time for this new service and was assured by the specialty society and other RUC members that the median survey intra-service time of 45 minutes was reasonable for the service provided. It was also explained that this new service can only be performed with an ERCP and not separately.

The RUC also compared the code 48400 *Injection procedure for intraoperative pancreatography (List separately in addition to code for primary procedure)* (work RVU = 1.95) and agreed that although both codes involve 45 minutes of intra-service time, a higher work value was justified because endoscopy is a more intense procedure requiring greater technical skill compared to an injection. The RUC agreed that the most accurate work value for new code 43273 is between the specialty's survey 25th percentile (2.00) and its median (3.25). The RUC also believed the specialty calculated value of 2.24 was reasonable and provided for the proper rank order amongst these reviewed services. **The RUC recommends a relative work value of 2.24 for CPT code 43273.**

Practice Expense:
The RUC recommends no direct practice expense inputs for this add-on code.

New Technology:
The RUC recommends that 43273 be added to the new technology list as this procedure utilizes new techniques.

Conscious Sedation
The RUC determined that conscious sedation was only inherent in code 43273.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year old male presents with severe epigastric pain with radiation to the back. An abdominal ultrasound shows a normal gallbladder without stones and normal gallbladder wall thickness. An abdominal CT scan reveals a markedly dilated pancreatic duct at 1cm in diameter and a normal biliary tree. An ERCP reveals an enlarged ampulla of Vater with a markedly dilated opening and mucin in the orifice. Pancreatoscopy is performed to evaluate a presumed intraductal papillary mucinous neoplasm.

Percentage of Survey Respondents who found Vignette to be Typical: 71%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes Percent of survey respondents who stated it is typical in the Hospital/ASC setting? 61%

Is moderate sedation inherent to this procedure in the office setting? Percent of survey respondents who stated it is typical in the office setting?

Is moderate sedation inherent in your reference code (Office setting)? Yes

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? Yes

Description of Pre-Service Work:

Description of Intra-Service Work: After informed consent is obtained, the patient is brought to the therapeutic endoscopy suite. Sedation is administered intravenously, and the duodenoscope is introduced through the mouth with inspection of the esophagus, stomach and duodenum. Selective cannulation of the bile duct is obtained followed by multiple views of the cholangiogram under fluoroscopy. A guidewire is passed such that the tip is in the proximal biliary tree, and a standard biliary sphincterotomy is performed.

The cholangioscope is passed through the duodenoscope and into the biliary tree. Direct visualization is performed with careful inspection of the biliary and pancreatic epithelium. The mass lesion is identified and multiple biopsies are taken. The right and left intrahepatic biliary tree, common hepatic duct and common bile duct are all viewed. The cholangioscope is then withdrawn and then passed into the pancreatic duct. At the conclusion of the procedure, the cholangioscope is withdrawn and the physician proceeds with the remainder of the ERCP procedure.

Description of Post-Service Work:

Intra-Service intensity/complexity	4.85	3.22
Post-Service intensity/complexity	4.07	3.04

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Gastroenterological Association (AGA) and the American Society for Gastrointestinal Endoscopy (ASGE) conducted a survey of code +43273, Endoscopic cannulation of papilla with direct visualization of common bile duct(s) and/or pancreatic duct(s). This code was approved during the February 2008 CPT Editorial Panel meeting. *After reviewing the survey data, the societies recommend a work relative value unit (WRVU) 2.24 WRVUs and 45 minutes physician time (intra-service). The recommended value of 2.24 WRVU* is between the surve WRVU median (3.25) and 25th percentile (2.00).

Survey Process

The survey was disseminated to 195 practicing gastroenterologists. A total of 55 responses (28% response rate) were received.

2.24 WRVU Recommendation Development

The societies convened an expert panel to review the survey data for code +43273.

+43273 SURVEY DATA

RVU	
Low	0.60
25th	2.00
Median	**3.25**
75th	5.08
High	20.00

PHY TIME	
Pre-Service Time	
Median	25
Intra Time	
Low	2
25th	30
Median	**45**
75th	60
High	155
Post Time	
Median	20

The survey respondents reported physician time in the pre and post period. As physician work is typically not performed in the pre and post period for an add-on (ZZZ) code, the societies concluded this was the result of the survey respondents' lack of familiarity with the concept of pre/intra/post time and the survey instrument for an add-on code. The societies concluded it would be appropriate to remove the pre- and post- time and back-out the associated WRVUs from the survey median:

Survey Median = 3.25 WRVU

3.25 - ((25 x .0224) + (20 x .0224)) = **2.24 WRVU**

Using the Median intra-service time of 45 minutes, a WRVU of 2.24 results in an IWPUT of 0.050 (2.24/45). The value of 2.24 WRVU falls in between the survey median and 25th percentile. The expert panel concluded that this was an appropriate value for the service.

Data Evaluation

As a next step of analysis the advisors compared the recommended WRVU and time values of code +43273 with the reference code and other similar services.

Physician Time and WRVU Data for Reference and Other Related Services						
CPT Code	**Pre Time**	**Intra Time**	**Post Time**	**Total Time**	**WRVU**	**IWPUT**
43235* - Upper GI Endoscopy, Diagnosis	28	20	15	63	2.39	0.075
48400 – Injection, Intraop, Add-On		45		45	1.95	0.043
99358 – Prolonged E/M services, first hour		60		60	2.10	0.035

* Survey reference service

+43273 versus 43235

The expert panel compared +43273 to the reference service code 43235. 49% of the survey respondents chose this code as the reference service. The society is recommending a lower WRVU for +43273 (2.24) than the WRVU value of the reference service 43235 (2.39).

The advisors concluded that the relative relationship between these two codes was appropriate.

- The intra-service time of +43273 is more than twice as long as the intra-service period for 43235 (45 minutes versus 20 minutes). The value of the intra-service work portion of code 43235 is approximately 1.50 WRVU for 20 minutes of intra time.
    - 2.39 - ((18*.0224) + (5*.008) + (5*.0224) +(15*.0224)) = 1.4988 = 1.50
- The recommended value for +43273 (2.24) is less than 50 percent higher when compared to the intra-service WRVU for code 43235. Code +43273 is a procedure of much greater complexity, involving intra time over twice as long.
    - Although the recommended RVU for +43273 results in a slightly lower IWPUT than for 43235, the respondents indicated the surveyed procedure was of greater intensity and required much more skill than code 43235. The expert panel agreed that +43273 was a more intense service than 43235, which supported the WRVU recommendation of 2.24.

+43273 versus 48400

The expert panel compared +43273 to 48400 which has a WRVU value of 1.95. The panel concluded that the relative relationship between these two codes was appropriate.

- While the two codes have the same intra-service time of 45 minutes, the expert panel concluded that the higher WRVU for code +43273 was justified because endoscopy was a more intense procedure requiring greater technical skill compared to injection.

+43273 versus 99358

The expert panel compared +43273 to 99358 which has a WRVU value of 2.10. The panel concluded that the relative relationship between these two codes was appropriate.

- Code 99358 has more intra-service time (60 minutes) but a lower WRVU (2.10) in comparison to +43273.
- Advisors concluded that this was justified because code 99358 reflected prolonged evaluation and management services, while code +43273 reflected a more intense procedural service requiring greater technical skill.

In view of the above, the AGA and ASGE recommend 2.24 WRVUs and physician time of 45 minutes (intra-service) for code +43273.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The following CPT codes are identified as the primary or base code for the add-on code +432XX: 43260, 43261, 43262, 43263, 43264, 43265, 43267, 43268, 43269, 43271, 43272

Primary Codes for Add-On Code +432XX

Code	Global	WRVU	Time Source	Pre-Time	Intra-Time	Post-Time
43260	0	5.95	RUC	20	46	20
43261	0	6.26	RUC	20	55	20
43262	0	7.38	HARVARD	50	75	28
43263	0	7.28	RUC	47.5	76	40
43264	0	8.89	HARVARD	50	69	28
43265	0	10.00	RUC	40	83.5	35
43267	0	7.38	HARVARD	47	62	25
43268	0	7.38	HARVARD	51	78	29
43269	0	8.20	RUC	40	71	30
43271	0	7.38	HARVARD	47	61	26
43272	0	7.38	RUC	25	60	20

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Unique codes that describe cholangioscopy / pancreatoscopy currently do not exist. As such, current coding is very inconsistent. A variety of codes + modifiers are used when reporting a cholangioscopy / pancreatoscopy procedure including:

- 47999, Unlisted procedure, Biliary tract
- 48999, Unlisted procedure, pancreas
- 43260 + 47999, ERCP; diagnostic, with or without collection of specimen(s) by brushing or washing + Unlisted procedure, Biliary tract
- 43260+48999, ERCP; diagnostic, with or without collection of specimen(s) by brushing or washing + Unlisted procedure, pancreas
- 43260 - 22, ERCP; diagnostic, with or without collection of specimen(s) by brushing or washing with Service Modifier
- 47550, Add-on code: Biliary Endoscopy, intraoperative (choledochoscopy)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale. 43260.
The expert panel concluded that one of the primary codes (ERCP codes: 43260, 43261, 43262, 43263, 43264, 43265, 43267, 43268, 43269, 43271, and 43272) associated with the add-on code +432XX would make the most appropriate PLI crosswalk. The base ERCP code 43260 was selected by the expert panel.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

William Thorwarth, MD
Chair, CPT Editorial Panel
American Medical Association
515 N. State St.
Chicago IL 60654

November 21, 2008

Dear Dr. Thorwarth,

On behalf of the American College of Gastroenterology (ACG), the American Gastroenterological Association (AGA) and the American Society for Gastrointestinal Endoscopy (ASGE), we are writing to respond to the AMA CPT Editorial Panel's Executive Committee's request for clarification on whether the description of code 43273 Endoscopic cannulation of papilla with direct visualization of common bile duct(s) and/or pancreatic duct(s) (List separately in addition to code(s) for primary procedure) overlaps with the procedure reported with code 43262, Endoscopic retrograde cholangiopancreatography (ERCP) with sphincterotomy.

Code 43273 cholangioscopy / pancreatoscopy, describes the direct visualization of the biliary and/or pancreatic ducts. Direct visualization of the pancreatic and/or biliary tree allows for inspection and treatment of abnormalities that may not be detected radiographically. When performed, the cholangioscopy / pancreatoscopy service is separate and distinct from an ERCP procedure, whether the ERCP does or does not involve sphincterotomy. When performed for medically necessary reasons, it would be appropriate for physicians to be able to report 43273 together with 43262.

It is important to note that although there may have been some question among Editorial Panel members of whether ERCP with sphincterotomy was included in the description of CPT code 43273, the description of the procedure that was provided to physicians as part of the valuation survey (shown below) did not include sphincterotomy:

"Typical Patient/Service: A 60-year old male presents with severe epigastric pain with radiation to the back. An abdominal ultrasound shows a normal gallbladder without stones and normal gallbladder wall thickness. An abdominal CT scan reveals a markedly dilated pancreatic duct at 1cm in diameter and a normal biliary tree. An ERCP reveals an enlarged ampulla of Vater with a markedly dilated opening and mucin in the orifice.

Pancreatoscopy is performed to evaluate a presumed intraductal papillary mucinous neoplasm."

On reviewing the physician surveys submitted to the RBRVS Update Committee (RUC) when this procedure was valued earlier this year, ERCP with sphincterotomy was not part of the valuation of CPT Code 43273. Specifically, sphincterotomy was not included in the service description of the cholangioscopy / pancreatoscopy service that was surveyed. The code descriptor that was sent to those surveyed did show 432XX as an add-on procedure and clearly states to report in conjunction with the applicable ERCP codes (i.e. the parenthetical instruction was part of what those surveyed saw). The RUC identified that the valuation of 43273 should be lower than the valuation of an ERCP procedure.

On behalf of the ACG, AGA and ASGE, we recommend that the AMA amend the parenthetical associated with CPT Code 43273 to read (change highlighted in bold italic font): (Use 43273 in conjunction with 43260, 43261, **43262**, 43263, 43264, 43265, 43267, 43268, 43269, 43271, and 43272). This change should be made as soon as possible and be made retroactive and retrospective to January 1, 2009 so that providers can be reimbursed appropriately.

We appreciate the Panel's consideration of our clarification and request and look forward to your decision. Should you have any questions on our comments please contact Brad Stillman, American College of Gastroenterology at bstillman@acg.gi.org or (301) 263-9000, Shovana Sloan, American Gastroenterological Association at ssloan@gastro.org or (301) 272-1601, or Sheila Madhani, Consultant to the American Society for Gastrointestinal Endoscopy at sheila@marcassoc.com or (202) 833-0007.

Sincerely,

Daniel DeMarco, MD	Joel V. Brill, MD	Glenn Littenberg, MD
ACG	AGA	ASGE

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Laparoscopic Longitudinal Gastrectomy

In October 2008, the CPT Editorial Panel created a new code to describe a complex anatomic and metabolic weight loss operation that has been increasingly used as a primary operation for morbid obesity.

The RUC reviewed code 43775 *Laparoscopy, surgical, gastric restrictive procedure; longitudinal gastrectomy (ie, sleeve gastrectomy)* and compared it to code *43771 Laparoscopy, surgical, gastric restrictive procedure; revision of adjustable gastric restrictive device component only* (work RVU = 20.64, intra-service time = 120 minutes). The RUC reviewed the pre-service time and agreed with the specialty society that pre-service time package 4 FAC Difficult patient/difficult procedure with some modifications was appropriate. The RUC agreed that an additional 22 minutes of positioning time was appropriate (25 minutes total positioning time) to account for additional positioning and padding the morbidly obese patient in reverse Trendelenburg, including positioning the laparoscopic equipment/monitors so the surgeon and assistants may visualize and perform the operation. The RUC determined that the intra-service time of 120 minutes and immediate post-service time of 30 minutes appropriately accounts for the physician time required to perform this service and was identical to code 43771.

The specialty society indicated and the RUC agreed that the survey respondents over-estimated the physician work required to perform this service, as the survey median RVU would place this service out of rank order with this family of services. Therefore, the following building block was used to develop a relative value unit. Starting with code *43771 Laparoscopy, surgical, gastric restrictive procedure; revision of adjustable gastric restrictive device component only* (work RVU = 20.64, intra-service time = 120 minutes), another gastric restrictive procedure with identical intra-service time but one less hospital visit, and adding one 99321 hospital visit to arrive at a work RVU of 21.40 for 43775 (20.64 + 0.76 = 21.40), which is less than the survey 25th percentile work RVU. Additionally, the specialty society indicated and the RUC agreed that one 99214 visit is necessary because the typical patient is nauseated and requires lengthy dietary and fluid balance education on the first post-operative visit. **The RUC recommends a work RVU of 21.40 for code 43775.**

The RUC also agreed with the specialty society's additional rationale comparing 43775 to survey respondents key reference service 43644 *Laparoscopy, surgical, gastric restrictive procedure; with gastric bypass and Roux-en-Y gastroenterostomy (roux limb 150 cm or less)* (work RVU = 29.24, intra-service time of 180 minutes) which has similar intensity and complexity measures. However, the

survey data indicated 43775 will require 60 minutes less intra-service time and one less hospital day (99232) than 43644. By subtracting the 60 minutes less IWPUT and one less 99232 from 43644 the resulting work RVU is 21.37 (which is almost identical to the primary building block resulting RVU of 21.40).

Additional rationale:
29.24 RVU for 43644
-6.48 60 min less x 0.108 (IWPUT for 43644)
-1.39 1 less 99232
21.37

The RUC also compared 43775 to code 43330 *Esophagomyotomy (Heller type); abdominal approach* (work RVU = 22.06, 120 minutes intra-service time) which requires similar physician time and work. **The RUC recommends a work RVU of 21.40 for code 43775.**

237

New Technology
The RUC recommends that code 43775 be placed on the new technology list.

Practice Expense
The RUC recommends the standard 090-day global direct practice expense inputs for code 43775.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
•43775	BB1	Laparoscopy, surgical, gastric restrictive procedure; longitudinal gastrectomy (ie, sleeve gastrectomy) (For open gastric restrictive procedure, without gastric bypass, for morbid obesity; other than vertical-banded gastroplasty, use 43483)	090	21.40
43843		Gastric restrictive procedure, without gastric bypass, for morbid obesity; other than vertical-banded gastroplasty (For laparoscopic longitudinal gastrectomy (ie, sleeve gastrectomy), use 437XX)	090	21.08 (No Change)

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Assure appropriate selection, timing, and administration of DVT prophylaxis. Determine indication for intra-operative antibiotics and prescribe as necessary. Assess need for beta-blockers, order as required. Review preadmission work-up, with particular attention to imaging information and reports. Reexamine patient to make sure that physical findings have not changed, and update H&P. Record patient weight. Review results of preadmission testing (lab, EKG, chest x-ray, availability of blood products). Meet with patient and family to review planned procedure and post-operative management. Review and obtain informed consent, including witness. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic equipment. Assist in transfer of patient from gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. Monitor/assist with positioning of patient. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under general anesthesia, surgical laparoscopy is performed. Pneumoperitoneum is tablished to distend the abdomen, and the laparoscope is introduced. Gas flow and intra-abdominal pressure are refully monitored so as not to impair ventilation or venous return. Four to six trocar ports are sited through the anterior abdominal wall above the umbilicus. The viscera are inspected. An orogastric tube may be placed to decompress the stomach. The liver is retracted to allow visualization of the stomach to the esophageal hiatus. The Angle of His is exposed by dissecting the peritoneal attachments. From a site approximately 4-6 cm proximal to the pylorus, the gastrocolic ligament is opened and divided cephalad along the greater curvature. The dissection and

division is carried through the gastro-splenic ligament and the short gastric vessels until the angle of His is reached. The posterior attachments of the stomach to the lesser sac are then dissected to free the lesser curvature. A Bougie or wide bore tube is passed though the mouth into the stomach and with laparoscopic visualization, is positioned along the lesser curvature. Starting proximal to the pylorus and staying parallel to the bougie the greater curve of the stomach is th divided longitudinally with several firings of an endoscopic stapler until the Angle of His is reached. Care is taken exclude the entire fundus of the stomach and to not impinge on the GE junction. The staple line may be over sewn or otherwise sealed per surgeon preference. Staple line integrity is checked to exclude leaks. The resected stomach segment is placed in a retrieval bag and extracted with enlargement of one of the trocar site incisions. The extraction site is closed at the fascia. The operative field is carefully inspected to ensure good hemostasis. A drain may be placed per surgeon preference along the gastric staple line. The liver retraction is released, and the trocars are removed. The incisions are closed.

Description of Post-Service Work:
Hospital:
Apply sterile adhesive strips and dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Instruct nursing staff in care of tubes and other devices. Review post-operative labs. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart and record. Dictate operative report and copy referring physician(s). Discontinue perioperative antibiotic therapy as appropriate. Write orders for transferring to general surgical floor and discuss ongoing care with floor nurses. Order x-rays (e.g. barium esophagram) as per routine. Examine patient, including reviewing vital signs and confirming as necessary. Auscultate heart, lungs, and abdomen for bowel sounds. Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection. Continue prophylaxis for DVT. Monitor daily for adequacy. Assess need for beta-blockers, order as required. Monitor and document patient progress. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status and renal function. Review nursing/other staff patient chart notes. Write orders for labs, x-rays, medications, diet, and patient activity. Chart patient progress notes, daily. Review available x-rays (if ordered). Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriat Discuss in detail dietary restrictions for the immediate post-operative period (e.g. liquid or mechanical soft diet and it duration) and coordinate continuing care by nutritionist. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is return of bowel function, adequate nutritional intake, and adequate pain control with oral analgesics. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office:
Talk with and examine patient. Remove dressings, sutures, when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination Assess effect of procedure with current weight. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Coordinate continuing care by nutritionist. Post discharge labs/films are ordered and reviewed. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart.

Post-Service intensity/complexity	3.96	4.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Comparison to key reference code: 43644 *Laparoscopy, surgical, gastric restrictive procedure; with gastric bypass and Roux-en-Y gastroenterostomy (roux limb 150 cm or less)*

New code 4377X *Laparoscopy, surgical, gastric restrictive procedure; longitudinal gastrectomy (ie, sleeve gastrectomy)* was created to report a complex anatomic and metabolic weight loss operation that has been increasingly

used as a primary operation for morbid obesity. In comparison to the key reference code, the pre-service evaluation and positioning of morbidly obese patients would be essential identical for the new code. Although intra-operative intensity and complexity are similar for both 43644 and 43775, the new procedure is more rapidly performed. Post-operative hospital stay for 43644 may be one day longer, but follow-up office visit work is the same.

Pre-Time: With respect to the pre-service time, we recommend package 4 (difficult patient / difficult procedure) with modification to positioning:

- Evaluation: no change (40 min)
- Positioning: Add 22 minutes (total = 25 min) to account for additional positioning and padding the morbidly obese patient in reverse Trendelenburg, including positioning the laparoscopic equipment/monitors, surgeon and assistants to visualize and perform the operation. This total time of 25 minutes is consistent with other laparoscopic gastric restrictive procedures that the RUC has accepted as reasonable time for this component.
- Scrub/Dress/Wait: no change (20 min)

RVW Recommendation:
As support, we compare this recommendation to another gastric restrictive procedure with similar intra-time and office time, but one less hospital day - 43771 *Laparoscopy, surgical, gastric restrictive procedure; revision of adjustable gastric restrictive device component only*: **The consensus committee reviewing the survey data recommends an RVW of 21.40**

20.64 RVW for 43771
+0.76 1 more 99231
21.40

The survey intensity and complexity measures for the reference code and survey code are almost identical. However, the survey data indicate the new code will require 60 minutes less intra-operative time and one less day in the hospital., to account for these differences, as presented below:

29.24 RVW for 43644
-6.48 60 min less x 0.108 (IWPUT for 43644)
-1.39 1 less 99232
21.37

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
43659 Unlisted laparoscopy procedure, stomach 43999 Unlisted procedure, stomach
43843-22 Gastric restrictive procedure, without gastric bypass, for morbid obesity; other than vertical-banded gastroplasty

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Bariatric surgery is performed at a rate of approximately 200,000 procedures per year in the United States. The majority of these are either gastric bypass or adjustable gastric banding. The rate of longitudinal gastrectomy is estimated at 1500 procedures per year.

Specialty general surgery Frequency 1500 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 50
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This procedure is not typically performed on Medicare-aged patients.

Specialty general surgery Frequency 50 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. The reference code RVW and intra-time are significantly greater than 43775. We suggest code 43279 (Laparoscopy, surgical, esophagomyotomy (Heller type), with fundoplasty, when performed) which has a similar total time and RVW and involves a patient that has significant co-morbidities and intra-op risk.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

BB1 43775 Laparoscopy, surgical, gastric restrictive procedure; longitudinal gastrectomy (ie, sleeve gastrectomy)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus committee of general surgeons agree that this procedure would not be performed in an office setting and would not typically be an emergency procedure.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The clinical staff completes pre-service diagnostic and referral forms. They call the facility to schedule space and equipment needed and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. Clinical staff will provide and review educational materials and information including instructions on diet and changes to medications prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carrier out. Calls may also be necessary to coordinate changes in polypharmacy with the PCP prior to the procedure.

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities
Discharge management and office visit related activities are performed.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Fistula Plug

CPT converted a Category III code to a Category I code to report anal fistula repair with a fibrin plug, as this form of treatment has become more widely used.

The RUC reviewed the survey data for 46707 *Repair of anorectal fistula with plug (eg, porcine small intestine submucosa [SIS])* and agreed with the specialty society that an additional 7 minutes of positioning in the pre-service time period would be appropriate given that the patient needs to be placed in a prone jack-knife or dorsal lithotomy position and buttocks are effaced. The RUC compared the surveyed code to the key reference code 46280 *Surgical treatment of anal fistula (fistulectomy/fistulotomy); complex or multiple, with or without placement of seton* (Work RVU=6.28). The RUC noted that the surveyed code and its reference code have similar intra-service times, 40 minutes and 45 minutes, respectively. The RUC compared the intensity complexity measures of the surveyed code and reference code and noted that overall these services required equal amounts of technical skill, physical effort and mental effort to perform. However, the RUC did note that the intra-service time intensity is greater in the surveyed code as the surgeon must place a suture through the fistula track without disrupting the track integrity, attach the other end to the "plug" and then gently pull the plug through the fistula track with care until it is snug, whereas in the reference code a surgeon would place a fistula probe through the fistula track and cut the tissue above the probe and pass a seton through the fistula and tie the ends together. Based on these comparisons, the RUC agreed the specialty societies' recommended work RVUs for this procedure, 6.30 Work RVUs, the survey median. **The RUC recommends 6.30 Work RVUs for 46707.**

New Technology List:
As this service is currently being reported with a Category III code, the RUC recommended that this code be placed on the New Technology List.

Practice Expense:
The RUC approved the practice expense inputs as recommended by the specialty societies 090 day global standards.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:46707 Tracking Number CC1 Specialty Society Recommended RVU: **6.30**

Global Period: 090 RUC Recommended RVU: **6.30**

CPT Descriptor: Repair of anorectal fistula with plug (eg, porcine small intestine submucosa [SIS])

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 44-year-old male presents with a 3-month history of perianal itching, pain, and drainage. Four months ago he had a perianal abscess incised and drained. Physical exam reveals an external os (opening) in the posterior anal space with drainage of mucus with no signs of acute infection or recurrent abscess. Upon anoscopy there is an internal os (opening) directly in the mid line at the dentate line. The diagnosis of a transsphincteric fistula of the deep posterior anal space is confirmed. Repair of the anal fistula with a cellular xenogeneic plug is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Percent of survey respondents who stated they perform the procedure; In the hospital 65% , In the ASC 23%, In the office 13%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 94% , Kept overnight (less than 24 hours) 3% , Admitted (more than 24 hours) 3%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Confirm pre-operative enemas have been carried out. Review pre-operative work-up and labs. Review prior diagnostic studies. Reexamine patient to make sure that physical findings have not changed and update H&P. Review the surgical procedure, post-op recovery in and out of the hospital, and expected outcome(s) with patient/family. Obtain informed consent. Change into scrub clothes. Review length and type of anesthesia with anesthesiologist. Verify that all necessary surgical instruments and supplies are readily available in the operative suite. Assist with patient positioning (typically prone jackknife or dorsal lithotomy). The perineum is prepped and draped in a sterile fashion and the buttocks are taped apart. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, A Hill - Ferguson rectal retractor is placed into the anus and isolation and identification of the internal os is made by passing a series of fistula probes through the fistula tact into the anus. The fistula tract is thoroughly cleaned, irrigated, and debrided. At this time the cellular xenogenic plug is placed in normal saline for 5 to 7 minutes. A large fistula probe is then passed through the external opening and advanced through the tract until it extends through the internal opening. A suture is passed through the tail of the soaked plug. The plug is then pulled into the fistula tract and drawn through the tract until the wider end is tightly aligned with the internal opening, with the "tail" extending distally through the external opening. The internal end of the plug is sutured into

place, being careful to also close the internal opening of the fistula tract. Excess "tail" protruding from the external opening is trimmed off and the distal end of the plug sutured to the skin at the external opening, being careful to leave this open for drainage. A long acting local anesthetic is injected into the perianal area for comfort postoperatively.

Description of Post-Service Work: Facility: Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Examine patient to assess for the development of complications (eg, plug migration, bleeding). Dictate operative report (copy PCP and/or referring physician) and complete medical record documentation. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions, especially diet, activity, bathing. Reconcile medications and write orders for post-discharge medication. Complete all appropriate medical records, including discharge summary and discharge instructions, and insurance forms.

Office: Examine and talk with patient. Discuss diet, activity and hygiene. A diagnostic anoscopy will be performed at one or more office visits to assess resolution of fistula. Write prescription orders, as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Intra-Service intensity/complexity	3.21	3.00
Post-Service intensity/complexity	2.79	2.75

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Surgeons have a number of procedural options for treating anal fistulae. These include fistulotomy, fistulectomy, fibrin glue injection, seton placement, and endorectal advancement flap closure. A Category III code for fibrin plug became effective for reporting purposes January 1, 2007. Because this treatment has become more widespread, a change from Cat III code to Cat I was approved for CPT 2010.

Comparison to key reference code: 46280 *Surgical treatment of anal fistula (fistulectomy/fistulotomy); complex or multiple, with or without placement of seton*

New code 467X1 *Repair of anorectal fistula with plug (eg, porcine small intestine submucosa [SIS])* has become mor widely used and the literature has shown the procedure has efficacy. In comparison to the key reference code, all components of time (pre, intra, post) for the new code would be the same. However, new code 46707 is more intense/complex than 46280. Intra-operatively, the surgeon must place a suture through the fistula track with out disrupting the track integrity, attach the other end to the "plug," and then gently pull the plug through the fistula track with care until it is snug. Then place a suture seromuscularly through the internal os then through the plug with out disrupting the plug or it's position, then approximate the mucosa of the rectum over the plug (internal os). Then place a similar suture through the external os, skin through plug then skin to close the aperture of the external os with the plug just under the skin. This is more intense / complex than 46280 where you place a fistula probe through the fistula track and cut the tissue above the probe and pass a seton through the fistula and tie the ends together.

Pre-Time: With respect to the pre-service time, we recommend package 3 (straightforward patient / difficult procedure):

- Evaluation: no change (33 min)
- Positioning: Add 7 minutes (total = 10 min). Patient is positioned prone jackknife or in dorsal lithotomy and buttocks are effaced.
- Scrub/Dress/Wait: no change (15 min)

RVW Recommendation: The survey intensity and complexity measures for the survey code are very similar or slightly greater than the reference code, including the intra-service complexity.. **The consensus committee reviewing the survey data recommend the survey median RVW of 6.30.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unliste code is reviewed) 0170T Repair of anorectal fistula with plug (e.g. porcine small intestine submucosa (SIS)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty colon and rectal surgery How often? Sometimes

Specialty general surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on sales data since the device's product launch in May, 2005, it is estimated that this procedure is performed approximately 5,000 times annually.

Specialty colon and rectal surgery Frequency 4000 Percentage 80.00 %

Specialty general surgery Frequency 1000 Percentage 20.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Anal fistulae are not primarily a disease of the 65+ population, so Medicare utilization will be a small fraction of that number.

Specialty colon and rectal surgery Frequency 80 Percentage 80.00 %

Specialty general surgery Frequency 20 Percentage 20.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Facility Direct Inputs

CPT Long Descriptor:

46707	Repair of anorectal fistula with plug (eg, porcine small intestine submucosa [SIS])

Sample Size: N/A Response Rate: (%):_____ Global Period:_____

Geographic Practice Setting %: Rural____ Suburban_____ Urban_____

Type of Practice %: _____Solo Practice
_____Single Specialty Group
_____Multispecialty Group
_____Medical School Faculty Practice Plan

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus committee of colon and rectal surgeons representing all types of practices and all geographic settings discussed the practice expense details for new code CC1. The consensus was that neither of this procedure would not be performed in the office setting. Additionally, the committee agreed that at least one of the follow-up office visits would require an anoscopy that would not be separately billable. Further the consensus was that the clinical staff work, supplies, and equipment necessary for key reference code 46280 are the same for new code CC1. These are shown on the Excel file and crosswalked to the new code.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The clinical staff completes pre-service diagnostic and referral forms. They call the facililty to schedule space and equipment needed and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. Clinical staff will provide and review educational materials and information including instructions on diet and bowel cleansing prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carrier out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure.

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities
Discharge management and office visit related activities are performed.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Temporary Prostatic Urethral Stent Insertion

At its October 2008 meeting, the CPT Editorial Panel created 53855, *Insertion of a temporary prostatic urethral stent, including urethral measurement*, a Category I code to describe the work previously reported in Category III code, 0084T, *Insertion of a temporary prostatic urethral stent*, to accurately describe the measurement and insertion of a temporary prostatic stent as a stand alone procedure used as treatment for complications that follow microwave therapy (code 53850, *Transurethral destruction of prostate tissue; by microwave thermotherapy*). Approximately 10% of patients who have microwave therapy may potentially require this procedure or placement of a foley catheter, which is the only present treatment.

The RUC reviewed the survey data from 30 urologists presented by the specialty society. The RUC reviewed the survey physician times and agreed that the median survey intra-service time of 15 minutes is appropriate. The RUC also agreed with the specialty society that pre-service time package 5, non-facility procedure without sedation or anesthesia, is appropriate. The RUC also agreed with the specialty society expert panel that the survey 25th percentile work RVU of 1.64 is appropriate. The RUC compared 53855 to key reference service 53620, *Dilation of urethral stricture by passage of filiform and follower, male; initial* (work RVU = 1.62), which reflects similarities to the time. The RUC concluded that the two services are similar and recommended the survey 25th percentile work RVU of 1.64. **The RUC recommends the survey 25th percentile work RVU of 1.64 for 53855.**

262

Modifier 51
The RUC recommends that 53855 not be placed on the modifier -51 exempt list because the procedure is performed within the global period of 53850, *Transurethral destruction of prostate tissue; by microwave thermotherapy*, but never performed with 53850.

Practice Expense
The RUC reviewed the direct practice expense inputs for 53855 and approved the attached inputs.

New Technology
The RUC recommends that 53855 be placed on the New Technology list.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲52282		Cystourethroscopy, with insertion of permanent urethral stent (For placement of temporary prostatic urethral stent, see code 53855)	000	6.39 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:53855 Tracking Number H1 Specialty Society Recommended RVU: **1.64**

Global Period: 000 RUC Recommended RVU: **1.64**

CPT Descriptor: Insertion of a temporary prostatic urethral stent, including urethral measurement

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old man presents to his urologist for an evaluation of continuing lower urinary tract symptoms (LUTS) caused by prostatic enlargement. it is determined the patient is a candidate for a minimally invasive prostatic therapy. Two to five days following the minimally invasive therapy, the patient presents with temporary worsening symptoms (e.g. decreased voided volume, increase in post-void residual urine, urinary retention). A temporary prostatic urethral stent is placed to manage voiding dysfunction during the healing phase. (Prostatic thermotherapy, when performed, should be reported separately.)

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Percent of survey respondents who stated they perform the procedure; In the hospital , In the ASC , In the office

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day , Kept overnight (less than 24 hours) , Admitted (more than 24 hours)

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting?

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting?

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: The patient is draped and prepped for a typical sterile urethral device insertion procedure.

Description of Intra-Service Work: The length of the urethra from the bladder neck to the distal side of the external sphincter is measured using the measurement device. The appropriate length stent is selected to accommodate the patient's anatomical requirements and prepared for insertion. The stent and insertion tool is inserted into the urethra until the distal tip and balloon are positioned in the bladder. The balloon is then inflated; the urethral stent is positioned in the prostatic urethra and then deployed. The insertion tool is slowly withdrawn from the urethra. The stent's retrieval tether may be trimmed such that the distal end is just inside the urethra's meatus.

Description of Post-Service Work: The patient should be assessed to assure that the patient is able to void adequately prior to discharge from the clinic.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AUA's RUC panel reviewed the survey responses and determined that the 25th percentile is an appropriate RV value.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0084T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 600
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Information provided by AbbeyMoor Medical, Inc., the manufacturer of the product used in this procedure.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 420
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Information provided by AbbeyMoor Medical, Inc., the manufacturer of the product used in this procedure. Note: Per the specialty, approximately 10% of those who receive microwave therapy may have complications that require 5385X.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The recommendations were developed by a Panel consisting of six physicians who represents urological practices from across the United States in single specialty groups in suburban and urban settings. They represent the states of Washington, Illinois, Virginia, New York, South Carolina and Arizona. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

Please describe the clinical activities of your staff:
Pre-Service Clinical Labor Activities:
Review charts
Greet patient and provide gowning
Obtain vital signs
Provide pre-service education/obtain consent
Prepare room, equipment, supplies
Prepare and position patient/ monitor patient/ set up IV

Intra-Service Clinical Labor Activities:
Assist physician during procedure by monitoring patient
Handing instruments to the physician during procedure
Assist physician in measuring stent

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

October 2008

Laparoscopic Revision of Prosthetic Vaginal Graft

The CPT Editorial Panel created a new Category I code to describe the work associated with performing the excision, revision or removal of prosthetic vaginal material via the laparoscopic approach as this work is currently not captured accurately in CPT.

The RUC reviewed the specialty society survey data for 57426 *Revision (including removal) of prosthetic vaginal graft; laparoscopic approach*. The RUC discovered that the specialty society removed the post-operative visit times associated with 99232 Hospital Visit and a 99213 Office Visit from the survey data in their recommendation. The RUC agreed that the work RVUs associated with these visits should be removed from the survey median RVW, 16.46 RVUs. Removing this associated work results in a work RVU of 14.15. The RUC believed this value to be appropriate as it maintains rank order in comparison to several reference codes including: 57296 *Revision (including removal) of prosthetic vaginal graft; open abdominal approach* (RVU=16.46) which has a total service time of 429 minutes in comparison to the surveyed code which has a recommended total service time of 360 minutes and 51990 *Laparoscopy, surgical; urethral suspension for stress incontinence* (Work RVU=13.26) which has a total service time of 324 minutes in comparison to the surveyed code which has a recommended total service time of 360 minutes. **The RUC recommends 14.15 RVUs for 57426.**

276

The RUC also addressed the specialty society recommended frequency information. The specialty society recommended that this service will be performed nationally 200 times per year and 100 times a year to Medicare patients. The RUC noted that the coding proposal stated different statistics regarding this frequency data. The specialty society stated that this was an error on the coding proposal and that the frequency data supplied on the summary of recommendation form is correct.

Practice Expense:
The RUC recommends the standard 090 day global practice expense packages for these services as they are only performed in the facility setting.

New Technology:
Because this service represents new technology that has not been widely used, the RUC recommends that 57426 be added to the new technology list as well as 57425 *Laparoscopy, surgical, colpopexy (suspension of vaginal apex)*, as 57425 is a mirror service to 57426.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●57426	C1	Revision (including removal) of prosthetic vaginal graft; laparoscopic approach	090	14.15

277

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:57426 Tracking Number C1 Specialty Society Recommended RVU: **16.23**

Global Period: 090 RUC Recommended RVU: **14.15**

CPT Descriptor: Revision (including removal) of prosthetic vaginal graft; laparoscopic approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67 y/o G3 P3 female patient presents complaining of vaginal discharge, discomfort, and painful intercourse. She underwent abdominal sacral colpopexy using mesh about one year ago, which was uncomplicated. Her past medical history is negative. Her pertinent physical examination reveals mesh eroding through the apex of the vagina. Vaginal apical support is adequate. The surgeon decides that excision is necessary and performs this via the laparoscopic route.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No Percent of survey respondents who stated it is typical in the Hospital/ASC setting? 21%

Is moderate sedation inherent to this procedure in the office setting? No Percent of survey respondents who stated it is typical in the office setting?

Is moderate sedation inherent in your reference code (Office setting)? No

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Pre-service work includes: taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status; indications for the procedure and its appropriateness are reviewed; informed consent is obtained; the physician will admit the patient to the hospital; prepare the hospital records and chart in accordance with hospital policy; will check on the patient, and will review labs, x-rays and records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work: Access to the pelvis is achieved via laparoscopic approach. The vaginal tissue may be elevated by the surgeons free hand introduced vaginally or by an instrument placed within the vaginal cavity. The graft is identified and the peritoneum is opened over it.. Sharp dissection at the area of graft attachment to the vagina is performed. Care is taken not to dissect too deeply to avoid entering the bladder or rectum. The vaginal epithelium is dissected sharply around the eroding mesh, creating a plane between the vaginal epithelium and the endopelvic fascia. This dissection is taken circumferentially about 2 centimeters and the graft and attached tissue is removed. All of the eroding material is excised sharply being careful to avoid rectum, bladder, and small bowel. Once excision is complete, the remaining edges of the endopelvic fascia are re-approximated with delayed absorbable suture and the vaginal epithelium is also closed in layers. The portion of the graft that is attached to the pre-sacral ligament is then identified. Again, sharp dissection is completed being careful to avoid the significant vasculature here. The graft is removed as are the permanent sutures that were used to attach it. Skin wounds or vaginal mucosa are re-approximated. Irrigation is carried out and a urinary catheter is placed to complete the procedure.

Description of Post-Service Work: Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding.

The physician visits the patient in the hospital for 2 days. The patient is discharged on post op day 2 with instructions for follow-up care. The patient is reevaluated three times post operatively.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
57296	090	16.46	**RUC Time**

CPT Descriptor Revision (including removal) of prosthetic vaginal graft; open abdominal approach

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
19318	090	15.91	**RUC Time**	6,393

CPT Descriptor 1 Reduction mammaplasty

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
65750	090	16.60	**RUC Time**	967

CPT Descriptor 2 Keratoplasty (corneal transplant); penetrating (in aphakia)

Other Reference CPT Code	Global	Work RVU	Time Source
51990	090	13.26	**RUC Time**

CPT Descriptor Laparoscopy, surgical; urethral suspension for stress incontinence

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 12 **% of respondents:** 63.1 %

TIME ESTIMATES (Median)	CPT Code: 57426	Key Reference CPT Code: 57296	Source of Time RUC Time
Median Pre-Service Time	63.00	65.00	
Median Intra-Service Time	110.00	120.00	
Median Immediate Post-service Time	40.00	40.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	40.0	120.00	
Median Discharge Day Management Time	38.0	38.00	
Median Office Visit Time	69.0	46.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**360.00**	**429.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.92	3.83
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.83	3.67
Urgency of medical decision making	3.33	3.25

Technical Skill/Physical Effort (Mean)

Technical skill required	4.83	4.67
Physical effort required	4.67	4.42

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.67	4.58
Outcome depends on the skill and judgment of physician	4.83	4.67
Estimated risk of malpractice suit with poor outcome	4.33	4.17

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.83	3.75
Intra-Service intensity/complexity	4.92	4.75
Post-Service intensity/complexity	3.42	3.42

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty ob/gyn How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 200
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty ob/gyn Frequency 200 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty ob/gyn Frequency 100 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
PERC Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:
57426; Revision (including removal) of prosthetic vaginal graft; laparoscopic approach

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ACOG developed practiced expense recommendations for 57426 using a consensus panel format. ACOG's members familiar with practice expense participated in this process through emails. Members of ACOG's Committee on Coding and Nomenclature finalized the recommendations through emails.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

No changes were made to the standard pre-service times. During the pre-service period, clinical staff conducts the standard pre-service activities: An RN/LPN/MA (CMS Labor Supply code L037D) completes pre-service diagnostic and referral forms, coordinates pre-surgery services schedules space and equipment in facility, provides pre-service ducation/obtains consent, and conducts follow-up phone calls.

Intra-Service Clinical Labor Activities:

The standard 12 minutes are applied for this inpatient procedure for discharge day management services.

Post-Service Clinical Labor Activities:

The procedure has (3) level three office visits. The standard 36 minute time for the level three office visit was used. A total of 108 minutes has been applied for post-service clinical labor activities time.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

CT Colonography

The CPT Editorial Panel converted two Category III codes into three Category I codes to report diagnostic and screening computed tomographic (CT) colonography. This technology has now been in existence for over 10 years and there is enough widespread utilization of this technology to warrant the conversion of the Category III codes to Category I codes.

74261 ***Computed tomographic (CT), colonography, diagnostic, including image postprocessing; without contrast material***
The RUC reviewed the survey data for 74261 as compared to the reference code 75635 *Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (Work RVU=2.40) and noted that the intra-service times were very similar 40 minutes and 45 minutes, respectively. The RUC also removed 2 minutes of pre-service evaluation time as recommended by the specialty societies, as they agreed 5 minutes of evaluation time best reflected the service. Further, the RUC compared the surveyed code to another reference code, MPC code 78815 *Positron emission tomography (PET) with concurrently acquired computed tomography (CT) for attenuation correction and anatomical localization imaging; skull base to mid-thigh* (Work RVU=2.44) and noted very similar intra-service times, 40 minutes and 35 minutes respectively. In addition, the RUC compared the intensity/complexity measures of 74261 to its reference code 75635 and determined that the surveyed code required more technical skill and physical effort but less mental effort and judgment to perform than the reference code. Based on these comparisons, the RUC agreed with the specialty societies' recommended value of 2.40 RVUs which is slightly below the survey's 25th percentile, as this value appropriately places the amount of work for this code in comparison to the other CT colonography codes and other codes in the RBRVS. **The RUC recommends 2.40 Work RVUs for 74261.**

74262 ***Computed tomographic (CT), colonography, diagnostic, including image postprocessing; with contrast material(s) including non-contrast images, if performed***
The RUC reviewed the survey data for 74262, a very uncommonly performed service as indicated by the low Medicare utilization estimate. The RUC compared the surveyed code to the reference code 75635 *Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (Work RVU=2.40) and noted that the intra-service times were the same, 45 minutes. Further, the RUC compared the surveyed code to another reference code 75557 *Cardiac magnetic resonance imaging for morphology and function without contrast*

material; (Work RVU=2.35) and noted very similar intra-service times, 45 minutes and 40 minutes respectively. Further, the RUC removed 2 minutes of pre-service evaluation time as recommended by the specialty societies, as they agreed 5 minutes of evaluation time best reflected the service. In addition, the RUC compared the intensity/complexity measures of 74262 to its reference code 75635 and determined that the surveyed code required more technical skill and physical effort, more psychological stress and was overall a more intense procedure to perform than the reference code. Based on these comparisons, the RUC agreed with the specialty societies' recommended value of 2.50 RVUs, the 25th percentile of the survey data, as this value appropriately places the amount of work for this code in comparison to the other CT colonography codes and other codes in the RBRVS. **The RUC recommends 2.50 Work RVUs for 74262.**

74263 ***Computed tomographic (CT) colonography, screening, including image postprocessing***
The RUC reviewed the survey data for 74263 as compared to the reference code 75635 *Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (Work RVU=2.40) and noted that the surveyed code has less total service time than the reference code, 51 minutes and 70.50 minutes, respectively. Further, the RUC compared the surveyed code to another reference code 75557 *Cardiac magnetic resonance imaging for morphology and function without contrast material;* (Work RVU=2.35) and noted that the surveyed code had less total service time than this reference code, 51 minutes and 60 minutes, respectively. Further, the RUC removed 1 minutes of pre-service evaluation time as recommended by the specialty societies, as they agreed 7 minutes of evaluation time best reflected the service. In addition, the RUC compared the intensity/complexity measures of 74263 to its reference code 75635 and determined that the surveyed code required less psychological stress, mental effort and judgment to perform as compared to its reference code. Based on these comparisons, the RUC agreed with the specialty societies' recommended value of 2.28 RVUs, the 25th percentile of the survey data, as this value appropriately places the amount of work for this code in comparison to the other CT colonography codes and other codes in the RBRVS. **The RUC recommends 2.28 Work RVUs for 74263.**

New Technology List:
As these services are currently being reported with Category III codes, the RUC agreed with the specialty societies' recommendation that these codes should be placed on the New Technology List.

Practice Expense:
The RUC approved the practice expense inputs as recommended by the specialty societies.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Colonoscopy is the examination of the entire colon, from the rectum... *Surgical endoscopy always includes diagnostic endoscopy.* For computed tomographic colonography, see 74261-74263.

CPT Descriptor: Computed tomographic (CT) colonography, diagnostic, including image postprocessing; without contrast material

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female presents with abdominal discomfort, iron deficiency anemia and guaiac positive stools. Optical colonoscopy was unsuccessful due to extreme redundancy of the colon.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

- Review the reason for the exam, any pertinent clinical history and any prior imaging studies.
- Determine the appropriate CT protocol for the examination and communicate that protocol to the CT technologists.

Description of Intra-Service Work:

- Supervise insertion of rectal tube and instillation of room air or carbon dioxide.
- Review 2D [scout] topogram of abdomen and pelvis to ensure adequate colonic distention for each acquisition.
- Supervise acquisition of thin section, low-dose 2D CT images and review for adequacy.
- After ensuring continued adequate colonic distention, supervise acquisition of thin section, low-dose 2D CT images in the second position, typically prone, review for adequacy and instruct the technologist to acquire appropriate additional images if needed.
- Perform interactive manipulations of 3D image datasets (volume rendered, endoluminal and/or flythrough views) wi correlative multiplanar 2D reconstructions of datasets from all positions. Modify and perform additional targeted 3 reconstructions as necessary.
- Interpret both the supine and prone images of the colon (including decubitus if performed) using 2- and 3D reconstructions, including 3D endoluminal views, integrated with 2D multiplanar reformations and source images and compare to pertinent prior imaging studies.

- Dictate a report for the medical record.

Description of Post-Service Work:

- Review and sign report.
- Communicate significant results to referring physician and, when appropriate, discuss patient management.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The ACR reviewed the survey data. The reference service code is 75635 (CTA runoff) with work value of 2.40. The 25th percentile work value for 74261 is 2.45. We believe that this value for 74261 remains high compared to the recommended physician work value for codes 74262 (25th percentile work value of 2.50) and 74263 (25th percentile work value of 2.28). The 25th percentile for 7426X1 is also high based on the modest incremental increase in physician time between 74261 and 74263. Therefore, we recommend a physician work value of 2.40, slightly less than the 25th

percentile work value, accounting for the 2 minutes of additional intra-service time compared to 74263 (38 min compared to 40 min for 74261) and modest increase in complexity between 74263 and 74261 based on the typical patient.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0067T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 134600
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. Gastroenterology elected not to survey 7426X1 and 7426X2. We believe that radiology would be the dominant provider, but this may change as the technique becomes more widely used.

Specialty Frequency 0 Percentage 0.00 %

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

- Review the reason for the exam, any pertinent clinical history and any prior imaging studies.
- Determine the appropriate CT protocol for the examination and communicate that protocol to the CT technologists.

Description of Intra-Service Work:

- Supervise insertion of rectal tube and instillation of room air or carbon dioxide.
- Review 2D [scout] topogram of abdomen and pelvis to ensure adequate colonic distention for each acquisition.
- Supervise acquisition of thin section, low-dose 2D CT images and review for adequacy.
- After ensuring continued adequate colonic distention, supervise acquisition of thin section, low-dose 2D CT images in the second position, typically prone, review for adequacy and instruct the technologist to acquire appropriate additional images if needed.

When an indeterminate polypoid lesion is identified, supervise administration of intravenous iodinated contrast and .rgeted re-acquisition of 2D images the colon.

- Interpret 2D post-contrast images to differentiate an enhancing soft tissue lesion from adherent stool.
- Perform interactive manipulations of 3D image datasets (volume rendered, endoluminal and/or flythrough views) with correlative multiplanar 2D reconstructions of datasets from all positions. Modify and perform additional targeted 3D reconstructions as necessary.

- Interpret both the supine and prone images of the colon (including decubitus if performed) using 2- and 3D reconstructions, including 3D endoluminal views, integrated with 2D multiplanar reformations and source images and compare to pertinent prior imaging studies.
- Dictate a report for the medical record.

Description of Post-Service Work:

- Review and sign report.
- Communicate significant results to referring physician and, when appropriate, discuss patient management.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The ACR has reviewed the survey data. The reference service code is 75635 (CTA runoff) with work value of 2.40. We looked at the physician work values as well as the time difference between 74261, 74262, and 74263. 74261 has total time of 50 min (5, 40, 5) with recommended value of 2.40. 74262 has total time of 59 min (7, 45, 7). 7426X3 has total time of 51 min (8, 38, 5) with a recommended value of 2.28. Based on the incremental increase in the intra-service time, we believe that the 25th percentile work value of 2.50 is appropriate for 74262 code.

Intra-Service intensity/complexity	4.30	3.75
Post-Service intensity/complexity	3.00	3.10

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACR, AGA, and ASGE convened a consensus panel that included a number of physicians familiar with this service to review the RUC survey data. The reference code selected most commonly was code 75635 (CTA runoff) with a work value of 2.40. From the survey data the median recommended work value for code 74263 is 2.50, with times as follows: 8 min pre, 38 min intra, and 5 min post. The survey respondents indicated that code 74263 entails greater intensity and complexity than reference code 75635 for 7 of the 11 measures.

The panel reviewed the pre-time from the survey and noted that there is an additional 1 minute as compared to the standard package. We believe this additional minute is appropriate for 74263 because as a screening examination, patients may be self-referred and documentation of an appropriate physician for follow up adds additional time as compared to the typical XXX studies ordered by a physician.

The societies are recommending the 25th percentile work value of 2.28 with the median physician time of 8 min pre, 38 min intra, and 5 min post. In comparison to the reference service code, the panel noted that intra-service time was 7 minutes less; however; the intensity and complexity values indicate that 74263 is more intense. To reconcile these differences, the panel believes that the 25th percentile work value best reflects the physician work involved for code 74263.

This is supported by evaluation of several XXX non-radiology services previously valued by the RUC including 93312 and 99204. The time elements are as follows:

93312: Echocardiography, transesophageal, real-time with image documentation (2D) (with or without M-mode recording); including probe placement, image acquisition, interpretation and report

99204: Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family.

Code	Work value	Pre	Intra	Post	Total Time	Global
93312	2.20	15	13	15	43	XXX
99204	2.30	5	30	10	45	XXX

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

   Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0066T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty Gastroenterology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 396200
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. In 2003, 6.47 million colonoscopies were performed and out of these, 1.981 million were screening. An assumption was made that CTC volume will equal 20 percent of optical colonoscopy. The 70/ 30 breakdown is based on the number of surveys collected from each specialty.

Specialty Radiology Frequency 277340 Percentage 70.00 %

Specialty Gastroenterology Frequency 118860 Percentage 30.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 62,312 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. In 2007 Medicare data estimates that CPT code G0121 (Colorectal cancer screening; colonoscopy on individual not meeting criteria for high risk) was billed approximately 311,562 times. An assumption was made that CTC volume will equal 20 percent of optical colonoscopy. The 70/ 30 breakdown is based on the number of surveys collected from each specialty.

Specialty Radiology Frequency 43618 Percentage 69.99 %

Specialty Gastroenterology Frequency 18694 Percentage 30.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

CPT Long Descriptor:
74261: Computed tomographic colonography, diagnostic, including image postprocessing; without contrast material

74262: Computed tomographic colonography, diagnostic, including image postprocessing; with contrast material(s) including non-contrast images, if performed

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The ACR convened a group of radiologists from a broad range of geographic locations with differing practice circumstances and settings, who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Intra-Service Clinical Labor Activities:

- Greet patient and provide growing
- Provide pre-service education/ obtain consent
- Prepare room, equipment, supplies
- Prepare and position the patient
- Perform CT examination to obtain source images
- Start IV (for 74262 only)
- Assist physician during postprocessing including photography of all source and reformatted images
- Review images with physician for adequacy
- Clean room

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Cardiac MR Velocity Flow

At the February 2007 CPT Meeting, the Editorial Panel created eight new cardiac MRI codes, which were reviewed by the RUC in April 2007. In the *Final Rule* for the 2008 Medicare Physician Payment Schedule, CMS indicated that it would not cover the four of the eight new cardiac MRI services that include flow/velocity quantification. As such, the CPT Editorial Panel, at its November 2008 meeting, created one new add-on code for velocity flow and deleted the existing four services that previously included velocity flow. Specifically, the Panel created 75565, *Cardiac magnetic resonance imaging for velocity flow mapping* and deleted 75558, *Cardiac magnetic resonance imaging for morphology and function without contrast material; with flow/velocity quantification* (work RVU = 2.60), 75560, *Cardiac magnetic resonance imaging for morphology and function without contrast material; with flow/velocity quantification and stress* (work RVU = 3.00), 75562, *Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with flow/velocity quantification* (work RVU = 2.86), and 75564, *Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with flow/velocity quantification and stress* (work RVU = 3.35).

322

The specialty society presented the survey results of 79 cardiologists and radiologists for 75565. Survey respondents indicated a median work RVU of 0.50, which the specialty societies' expert panel agreed was too high. Moreover, the survey 25th percentile work RVU was 0.40, which the expert panel also agreed was too high. The expert panel noted that survey respondents indicated a key reference service 93320, *Doppler echocardiography, pulsed wave and/or continuous wave with spectral display* (List separately in addition to codes for echocardiographic imaging); complete (work RVU = 0.38, intra-service = 15 minutes). Given the similarity in the intensity and complexity required to perform the surveyed code and the reference service, and the difference in intra-service time between the two (10 minutes and 15 minutes, respectively), the specialties and the RUC agreed that the work RVU for 75565 should be lower than 93320.

In addition to reviewing the survey, the RUC reviewed the differentials between those codes that included flow and those that did not that had been valued by the RUC in April 2007. The RUC looked to codes 75557, *Cardiac magnetic resonance imaging for morphology and function without contrast material* (work RVU = 2.37) and 75561, *Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences* (work RVU = 2.60). The existing differential in work RVUs between 75557 (without flow) and 75558 (with flow) is 0.25. The existing differential in work RVUs between 75561

(without flow) and 75562 (with flow) is 0.26. The survey respondents indicated a median intra-service time of 10 minutes, with significant pre-service and post-service time, inconsistent with other ZZZ global period codes. The expert panel and the RUC agreed that no pre- or post-service time is required for this add-on service. In order to substantiate the survey median intra-service time, the RUC also examined the difference in intra-service time between the codes from April 2007. The difference in intra-service time between 75557 (without flow) and 75558 (with flow) is 5 minutes and the difference between 75561 (without flow) and 75562 (with flow) is 10 minutes. Given this, the specialty and the RUC agreed that the intra-service time of 10 minutes as reported by the surveyees was appropriate. **Therefore, the RUC recommends a work RVU of 0.25 and intra-service time of 10 minutes for 75565.**

Practice Expense

The RUC approved the practice expense inputs noting a reduction in the clinical staff intra-service time to 10 minutes consistent with the physician intra-service time.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Cardiac magnetic imaging differs from traditional magnetic resonance imaging (MRI) in its ability to provide a physiologic evaluation of cardiac function. Traditional MRI relies on static images to obtain clinical diagnoses based upon anatomic information. Improvement in spatial and temporal resolution has expanded the application from an anatomic test and includes physiologic evaluation of cardiac function. Flow and velocity assessment for valves and intracardiac shunts is performed in addition to a function and morphologic evaluation. Use 75559 with 75565 ~~and 75560~~ to report flow with pharmacologic wall motion stress evaluation without contrast. Use 75563 with 75565 ~~and 75564~~ to report flow with pharmacologic perfusion stress with contrast. Cardiac MRI for velocity flow mapping can be reported in conjunction with 75557, 75559, 75561, 75563. Listed procedures may be performed independently or in the course of overall medical care. If the physician providing these services is also responsible for diagnostic workup and/or follow-up care of the patient, see appropriate sections also. Only one procedure in the series 75557-75563 ~~75564~~ is appropriately reported per session. Only one add-on code for flow velocity can be reported per session. Cardiac computed tomography (CT) and coronary computed tomographic angiography (CTA) include the axial source images of the pre-contrast, arterial phase sequence, and venous phase sequence (if performed), as well as the two-dimensional and three-dimensional reformatted images resulting from the study, including cine review. Contrast enhanced cardiac CT and coronary CTA codes 75571-75574 include any quantitative assessment when performed as part of the same encounter. Report only one computed tomography heart service per encounter. (75552-75556 have been deleted. To report, see 75557, 75559, 75561, 75563, 75565)

CPT Descriptor: Cardiac Magnetic resonance imaging for velocity flow mapping (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year old male presents with heart failure, enlarged cardiac silhouette on chest x-ray and an eccentric jet of aortic regurgitation on echocardiography. Patient is undergoing cardiac MRI to evaluate ventricular size and function. Flow velocity quantification is also requested.

Percentage of Survey Respondents who found Vignette to be Typical: 72%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 34%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: • Supervise set-up of flow quantification scan planes
- Scan using flow protocols to obtain data to quantify valve function
- Adjust the parameters to optimize data accuracy
- Analyze velocity/flow data on an independent workstation
- Calculate regurgitation fraction, gradients or shunt ratio using velocity/flow data obtained

Description of Post-Service Work:

Post-Service intensity/complexity	3.74	2.86

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

his service is an add-on code used to reflect flow/velocity measurements attained through cardiac MRI. Eight new cardiac MRI codes received RUC valuation at the April 2007 RUC meeting and those values were accepted by CMS in the rulemaking process. Four of these codes included flow/velocity quantification, but these services were not covered by Medicare. As part of the coding application that established this new add-on code, the four codes that included flow/velocity (75558, 75560, 75562, 75564) were deleted.

The American College of Cardiology, American College of Radiology, and Society for Cardiovascular Magnetic Resonance convened a panel of physicians to review the results of the RUC survey on the new code. The survey was completed by 80 physicians who had performed the service an average of 120 times in the past year, so they were very familiar with the service.

In addition to reviewing the survey, the panel reviewed the differentials between those codes that included flow and those that did not that had been valued by the RUC in April 2007. After reviewing these items, the panel felt that the work value that had been recommended by the surveyees was not supported by the difference in the work RVUs between the existing codes as recommended by the RUC. The add-on service is most likely to be reported on codes 75557 and 755561. The existing differential in work RVUs between 75557 (without flow) and 75558 (with flow) is 0.25. The existing differential in work RVUs between 75561 (without flow) and 75562 (with flow) is 0.26. While this work value is below even the 25th percentile work RVU recommendation of the survey, the panel did not believe that this change in coding structure should increase the value for the service and that the surveys conducted in 2007 accurately reflected the level of work.

Examining the issue of the reported time, the survey respondents reported significant pre and post service time. Add-on codes do not routinely include pre or post service time, so the panel recommends that only intraservice time be assigned to this code. The survey respondents reported a median of 10 minutes of intraservice time. The panel also examined the difference in intraservice time that was found between the codes from April 2007. The difference in intraservice time between 75557 (without flow) and 75558 (with flow) is 5 minutes and the difference between 75561 (without flow) and 75562 (with flow) is 10 minutes. The panel felt that the intraservice time of 10 minutes as reported by the surveyees was reflective of the service time.

The panel also reviewed these recommendations in coordination with the key reference service. The key reference service of 93320 has a work value of 0.38 and an intraservice time of 15 minutes. The median intraservice time as reported by the surveyees was 10 minutes, 2/3 of the 15 minutes in the reference service. If the work value for 93320 was to be similarly cut by 1/3, it would equal 0.25, the same as the work value established by examining the differences between the existing codes reported with and without flow.

The panel recommends a work RVU of 0.25 and an intraservice time of 10 minutes with no pre and post service times.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75558, 75560, 75562 and 75564 were bundled codes used to report the base cardiac MRI service in addition to the flow/velocity quantification. As part of the application to the CPT Editorial Panel for this add-on code, those codes were proposed for deletion.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 20000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is based on the estimate provided in the original application for the cardiac MR codes in 2007, which was in turn based on expert opinion and a review of claims data. Because the new Cardiac MR codes were introduced in 2008, there is no claims data from those codes that can be used yet.

Specialty Cardiology Frequency 12000 Percentage 60.00 %

Specialty Radiology Frequency 8000 Percentage 40.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is based on the estimate provided in the original application for the cardiac MR codes in 2007, which was in turn based on expert opinion and a review of claims data. Because the new Cardiac MR codes were introduced in 2008, there is no claims data from those codes that can be used yet.

Specialty Cardiology Frequency 3000 Percentage 60.00 %

Specialty Radiology Frequency 2000 Percentage 40.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

CPT Code:75565

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
ZZZ Global Period
Non Facility Direct Inputs

CPT Long Descriptor: Cardiac Magnetic resonance imaging for velocity flow mapping (List separately in addition to code for primary procedure)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The ACC and ACR convened a group of cardiologists and radiologists from a broad range of geographic locations with differing practice circumstances and settings, who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Intra-Service Clinical Labor Activities:

The MR Tech will review charts and previous studies performed to determine flow.

The MR Tech ensures proper position of patient for the flow study. A test study is performed to confirm optimum timing for the diagnostic study. The source scans are obtained using breath hold and adjusting velocity flow setting. Multiple set-ups and acquisitions are being done to ensure the images are satisfactory.

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Coronary Computed Tomographic Angiography

In October 2008 the CPT Editorial Panel deleted eight Category III codes and created four new codes to describe the evolution of performing cardiac and coronary computed tomography for specific clinical scenarios.

75571 ***Computed tomography, heart without contrast material, with quantitative evaluation of coronary calcium***
The RUC reviewed the specialty societies' recommended data and agreed that the physician time (5 minutes pre-, 10 minutes intra- and 5 minutes post-service time) recommended by the specialties accurately reflected the service. However, the RUC did not agree that the survey values were reflective of the work performed, noting that even the survey 25th percentile work RVU of 0.70 was too high. The RUC compared 75571 to code 75962 *Transluminal balloon angioplasty, peripheral artery, radiological supervision and interpretation* (work RVU = 0.54 and 12 minutes total physician time) and determined that 75571 required slightly more work. The RUC also compared 75571 to similar services 95903 *Nerve conduction, amplitude and latency/velocity study, each nerve; motor, with F-wave study* (work RVU = 0.60 and 8 minutes pre-, 10 minutes intra- and 10 minutes post-service time) and 11000 *Debridement of extensive eczematous or infected skin; up to 10% of body surface* (work RVU=0.60 and 5 minutes pre-, 10 minutes intra- and 5 minutes post-service time). The RUC determined that a work RVU of 0.58 for 75571 appropriately accounts for the work required to perform this service. Additionally, CPT codes 75962, 95903 and 11000 have similar work RVUs and physician time compared to surveyed code 75571. **The RUC recommends a work RVU of 0.58 for CPT code 75571.**

75572 ***Computed tomography, heart, with contrast material, for evaluation of cardiac structure and morphology (including 3D image postprocessing, assessment of cardiac function, and evaluation of venous structures, if performed)***
The specialty society provided a very detailed description of the work included in 75572, which includes evaluation of cardiac structure, morphology, venous structures, 3D reconstruction, contrast and administration of a beta-blocker. The RUC agreed with the specialty society that the survey median work RVU of 2.25 is too high, while the survey 25th percentile work RVU of 1.25 does not account for the extent of the work performed. The RUC reviewed several comparable reference services: 72196, *Magnetic resonance (eg, proton) imaging, pelvis; with contrast material(s)* (work RVU = 1.72, pre-service = 15, intra-service = 20, post-service = 10); 71551, *Magnetic resonance (eg, proton) imaging, chest (eg, for evaluation of hilar and mediastinal lymphadenopathy); with contrast material(s)* (work RVU = 1.73, pre-service = 10, intra-service = 25, post-service = 10); 70498, *Computed tomographic angiography,*

neck, with contrast material(s), including noncontrast images, if performed, and image postprocessing (work RVU = 1.75, pre-service = 7, intra-service = 20, post-service = 10); and 70496, *Computed tomographic angiography, head, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU = 1.75, pre-service = 8, intra-service = 20, post-service = 10). The RUC agreed that these services are appropriate references and a work RVU of 1.75, which is half way between the survey 25th percentile and median, maintains rank order within this family of services. **The RUC recommends a work RVU of 1.75 for 75572.**

75573 ***Computed tomography, heart, with contrast material, for evaluation of cardiac structure and morphology in the setting of congenital heart disease (including 3D image postprocessing, assessment of LV cardiac function, RV structure and function and evaluation of venous structures, if performed)***

The RUC reviewed the pre-service time for 75573 and agreed with the societies' recommended additional pre-service time compared to the other services within this family, as the physician has several pre-operative tests to review and as the service is typically performed on a child, the physician must answer many questions posed by the patient and the patient's family. The RUC agreed that the service time, 15 minutes of pre-service time, 30 minutes of intra-service time and 15 minutes of post-service time, accurately reflect the service. After reviewing the physician time, the RUC compared the surveyed code to the reference code, 75564 *Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with flow/velocity quantification and stress* (Work RVU=3.35). As the surveyed code has significantly less total service time as compared to the reference code (60 and 85 minutes, respectively) and the surveyed code is performed on a child rather than an adult as in the reference code, the RUC agreed that a work RVU of 2.55, the surveyed 25th percentile, accurately reflects the work associated with 75573. **The RUC recommends a work RVU of 2.55 for 75573.**

337

75574 ***Computed tomographic angiography, heart, coronary arteries and bypass grafts (when present), with contrast material, including 3D image postprocessing (including evaluation of cardiac structure and morphology, assessment of cardiac function, and evaluation of venous structures, if performed)***

The RUC reviewed the specialty society physician time and work RVU data recommended data for code 75574, 10 minutes pre-service, 30 minutes intra-service and 10 minutes post-service time. The specialty society recommended a lower pre-and post-service time than the surveyed time by reducing 5 minutes from both the pre- and post-service time because the respondents indicated higher times than are typical when compared to similar services. The RUC determined that 30 minutes of intra-service time, as indicated by the survey respondents, was appropriate to account for the time required to perform this service (issue multiple beta blockers, contrast media two times, calculate fractions, calculate cardiac output, etc). The RUC then compared 75574 to code 75557 *Cardiac magnetic resonance imaging for morphology and function without contrast material* (work RVU = 2.35, 10 minutes pre-time, 40 minutes intra-time and 10 minutes post-time) plus 96375 *Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); each*

additional sequential intravenous push of a new substance/drug (work RVU = 0.10) (2.35 + 0.10 = 2.45) to support a work RVU of 2.40 for code 75574, which is less than the survey 25th percentile. **The RUC recommends a work RVU of 2.40 and 10 minutes pre-, 30 minutes intra- and 10 minutes immediate post-service time for code 75574.**

Practice Expense
The RUC reviewed the practice expense inputs for all four services within the family and confirmed the clinical labor time proposed by the Practice Expense Subcommittee. The RUC discussed the equipment and recommends that the uninterruptible power supply be deleted as it is an indirect expense. The tilt table was also deleted from equipment. The RUC reviewed the appropriate time that the CT scanner will be in use and recommends the following time (activities = lines 78 and 79):

75571, 16 slice CT = 15 minutes
75572, 64 slice CT = 26 minutes
75573, 64 slice CT = 37 minutes
75574, 64 slice CT = 43 minutes

338

The computer workstation and all software are equal to (line 88 - reconstruct images at selected intervals…)

75571 = 12 minutes
75572 = 21 minutes
75573 = 23 minutes
75574 = 29 minutes

New Technology
The RUC recommends that these services be added to the New Technology List.

PLI Codes
The RUC recommends the PLI for the technical component of each service be 0.00. The RUC recommends following PLI crosswalks:

75571 should be crosswalked to 78472
75572 should be crosswalked to 70498

75573 should be crosswalked to 75558
75574 should be crosswalked to 75557

71275		*Computed tomographic angiography, chest (noncoronary), with contrast material(s), including noncontrast images, if performed, and image postprocessing* (For coronary artery computed tomographic angiography including calcification score and/or cardiac morphology, use ~~0146T-0149T~~75574)	XXX	1.92 (No Change)

340

Cardiac computed tomography (CT) and coronary computed tomographic angiography (CTA) include the axial source images of the pre-contrast, arterial phase sequence, and venous phase sequence (if performed), as well as the two-dimensional and three-dimensional reformatted images resulting from the study, including cine review. Contrast enhanced cardiac CT and coronary CTA codes 75571-75574 include any quantitative assessment when performed as part of the same encounter. Report only one computed tomography heart service per encounter.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75571 Tracking Number K1 Specialty Society Recommended RVU: **0.70**

Global Period: XXX RUC Recommended RVU: **0.58**

CPT Descriptor: Computed tomography, heart, without contrast material, with quantitative evaluation of coronary calcium

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year-old male presents for evaluation. He is asymptomatic. His family history is significant for coronary disease with his father having suffered a myocardial infarction at the age of 58. A lipid profile is as follows: Total cholesterol 245 mg/dl, LDL cholesterol 156 mg/dl, HDL cholesterol 34 mg/dl, and triglycerides 190 mg/dl. Framingham risk assessment calculates a 10% risk of coronary disease over the following 10 years. A calcium score is ordered to help support the initiation of therapy with lipid-lowering agents.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform a E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:
- Review medical records and any applicable prior imaging studies
- Review protocol for examination with technologists and other clinical staff
- Review indication for study and appropriateness

Description of Intra-Service Work: Describe the procedure to the patient and obtain informed consent where applicable. Review scout views of area to be imaged, axial images of the heart for adequacy prior to transfer to the workstation, and post-processed images for the presence of calcified coronary atherosclerosis. Quantify coronary artery calcium using dedicated software that determines the "Agatston Score", the calcified volume and the mass of calcium. Next, compare the amount of calcium detected for each individual patient to databases of population data stratified for age, gender and ethnicity, and interpret source images for correlation with the post-processed images and for the presence of coexistin disease. Finally, compare and correlate with pertinent available prior studies and create report for the medical record

Description of Post-Service Work:
- Review and sign the final report for the patient's medical record

Time Segments (Mean)

Pre-Service intensity/complexity	2.14	2.20
Intra-Service intensity/complexity	2.76	2.82
Post-Service intensity/complexity	2.69	2.57

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACC, ACR, ASNC, SCAI, and SCCT convened a panel of physicians that included a number of physicians familiar with this service to review the RUC survey data. The group noted that nearly half of the respondents chose code 71250 as the key reference service for the procedure. In examining the differences between these codes, the panel noted that code 71250 has 22 minutes of total time and a work RVU of 1.6. The median response from the survey participants

indicated that the new service would take approximately 20 minutes total time, with half of that time devoted to the intraservice period. The median RVU recommendation for the new service was 1.01.

The panel noted that there was less time demanded for this new service and that the respondents indicated that it wa considerably less intense than the key reference code of 71250. The reference service was noted to be of particula higher intensity in mental effort and judgment. Although the survey respondents appeared to adjust for this reduced intensity in their recommendation of a 1.01 work RVU, the panel felt that the work RVU was still too high for this service. The panel determined that it would be more appropriate to recommend a work RVU of 0.70, which is identical to the 25th percentile response on the survey. The panel felt that the time inputs reflected on the survey of 5 minutes of pre-time, 10 minutes of intra-service time, and 5 minutes of post time were appropriate.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was previously reported using CPT Category III code 0144T.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 20000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. It is difficult to estimate the number of times that this service will be reported outside of the Medicare population, but it is expected that the specialty mix for the provision of these services will be similar to that seen in the Medicare use of the existing temporary codes.

Specialty Cardiology Frequency 15000 Percentage 75.00 %

Specialty Radiology Frequency 5000 Percentage 25.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is based on the reporting patterns of the CPT Category III code 0144T that had previously been used to track this service. This is roughly equal to the number of these service reported in the Medicare population in 2007, when the service was covered in much of the country.

Specialty Cardiology Frequency 2200 Percentage 73.33 %

Specialty Radiology Frequency 800 Percentage 26.66 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 77003

ndicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75572 Tracking Number K2 Specialty Society Recommended RVU: **1.75**

Global Period: XXX RUC Recommended RVU: **1.75**

CPT Descriptor: Computed tomography, heart, with contrast material, for evaluation of cardiac structure and morphology (including 3D image post processing, assessment of cardiac function, and evaluation of venous structures, if performed)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66 year-old female is seen for treatment of atrial fibrillation. A 48 hour monitor now shows her to be in atrial fibrillation ~12% of the time. RF ablation is planned to isolate the pulmonary veins and eliminate the focus of atrial fibrillation. Cardiac CT is ordered by the electrophysiologist to identify the number, location, and morphology of the pulmonary veins as they enter the left atrium, the contours of the endoluminal surface of the left atrium, and the location of the esophagus in relation to the pulmonary veins.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 4%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

- Review medical record and any applicable prior imaging studies
- Review indication for study and appropriateness
- Review patients symptoms if present
- Review previous cardiac surgical reports
- Review medication list
- Review previous drug allergies and potential contrast allergy
- Determine heart rhythm and need for pharmacological intervention
- Assess baseline heart rate and the need for pharmacological intervention to lower the heart rate
- Prescribe pharmacological intervention to lower the heart rate if necessary
- Review protocol for examination with technologists and other clinical staff

Description of Intra-Service Work: Describe the procedure to the patient and obtain informed consent where applicable. Review scout views of area to be imaged and non-contrast CT images to localize the vascular phase sequence and to screen those patients who are not candidates for the arterial phase component of the study. Supervise administration of

low- or iso-osmolar contrast material. Administer IV medication to lower heart rate when necessary and administer IV medication to control heart rhythm when necessary. Manage pacemaker function and rate when applicable. Review the arterial phase CT images to ensure adequate anatomic coverage. Prescribe and review venous phase images as necessary. Create two-dimensional reconstructions of the vasculature, interpret, and annotate. Create three-dimensional reconstructions of the vasculature and associated myocardium and adjust the projection of the three-dimensional reconstructions to optimize visualization of anatomy or pathology. Interpret the axial source images of the pre-contrast, arterial phase sequence, and venous phase sequence, as well as the two-dimensional and three-dimensional reformatted images resulting from the study, including cine review. Compare study results to all pertinent available prior studies and dictate report for medical record.

Description of Post-Service Work:

- Manage complications related to IV, contrast agent, or medications given at the time of the study
- Review and sign the final report for the patient's medical record

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Valı Recommendations for the appropriate formula and format.*

ACC, ACR, ASNC, SCAI, and SCCT convened a panel of physicians that included a number of physicians familiar with this service to review the RUC survey data. The panel noted that there was extraordinary variation among the work RVUs recommended by the survey respondents, with the 25th percentile recommended work RVU at 1.25 and the

75th percentile recommended work RVU at 2.80. The panel also noted that the key reference service 71260 (CT thorax, with contrast) was chosen by only 23% of the respondents.

In comparing the new service to the key reference codes, the panel noted that the new service was moderately more intense than the key reference service in most cases. The key reference service of 71260 has a work value of 1.24 and an intraservice time of 15 minutes. The median intraservice time as reported by the surveyees for the new service was 20 minutes. The panel felt that the slightly higher intensity and longer time for the service of the new code did not justify the median RVU of 2.25, an entire work RVU greater than the key reference service. However, the panel felt that the 25th percentile response of 1.25 did not adequately account for the additional time required of the new code, which is 5 minutes longer or the slightly higher intensity. The panel recommended that the work RVU of 1.75 would be most appropriate for this service, reflecting the midpoint between the 25th percentile and the median.

The panel felt that a work RVU of 1.75 and an intraservice time of 20 minutes appropriately reflected the level of work required for the service and compared well to other codes. The panel thought that the code compared well with code 70496, CT angiography of the head with contrast. This code, which was RUC valued in 2000, also has 20 minute of intraservice time and a work value of 1.75. Although this code was not selected as a reference service by the majority of respondents, this may be explained by the fact that 75% of the survey respondents were cardiologists, who do not frequently perform this service. The panel also looked at code 71275, CT angiography of the chest (non coronary) as an additional comparison code. That code, which was RUC valued in 2001, is valued at 1.92 with 30 minutes of intraservice time. Although the intraservice time for the new service is only 20 minutes (2/3 of 71275), it would likely have a higher intensity than a non-coronary CT of the chest.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was previously reported using the CPT Category III code 0145T as well as elements of other codes 0148T, 0149T, and 0151T. The codes were reorganized for the Category I code proposal and this reorganization was accepted by the CPT Editorial Panel.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 35000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is difficult to predict how often this newly developing technology will be used in the general population. The estimated specialty mix is based on that reflected in the specialty mix for the existing Category III codes.

Specialty Cardiology Frequency 26000 Percentage 74.28 %

Specialty Radiology Frequency 9000 Percentage 25.71 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 18,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is based on a review of the 2007 claims data for the existing Medicare

Specialty Cardiology Frequency 13500 Percentage 75.00 %

Specialty Radiology Frequency 4500 Percentage 25.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Crosswalk to code 70498 as it has a similar work RVU. The TC PLI RVU should be 0.00.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75573 Tracking Number K3 Specialty Society Recommended RVU: **2.55**

Global Period: XXX RUC Recommended RVU: **2.55**

CPT Descriptor: Computed tomography, heart, with contrast material, for evaluation of cardiac structure and morphology in the setting of congenital heart disease (including 3D image post processing, assessment of LV cardiac function, RV structure and function and evaluation of venous structures, if performed)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 12-year-old male presents for evaluation. As an infant he underwent bilateral modified Blalock-Taussig shunts for Tetralogy of Fallot with pulmonary atresia. Subsequent to that he underwent total repair which included an aortic homograft Rastelli conduit from right ventricle to the pulmonary arteries. Echocardiography reveals pulmonary pressures that are 65% of systemic pressures. There is minimal Rastelli valve stenosis but marked insufficiency and right ventricular enlargement. Bilateral peripheral pulmonary artery stenosis is suspected but branch pulmonary arteries are not visualized on echocardiography. The patient is referred for cardiac CT to: 1) measure RV volume to determine whether he is a candidate for pulmonic valve replacement, and 2) define branch pulmonary arteries to rule out significant peripheral pulmonary stenosis.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 26%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 13%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

- Review medical record and any applicable prior imaging studies
- Review indication for study and appropriateness
- Review patient's symptoms if present
- Review previous cardiac surgical reports
- Review medication list
- Review previous drug allergies and potential contrast allergy
- Determine heart rhythm and need for pharmacological intervention
- Assess baseline heart rate and the need for pharmacological intervention
- Prescribe pharmacological intervention to lower the heart rate if necessary
- Review protocol for examination with technologists and other clinical staff

Description of Intra-Service Work: Describe the procedure to the patient and parents and obtain informed consent where applicable. Review scout views of area to be imaged and non-contrast CT images to localize the vascular phase sequence. Supervise administration of low- or iso-osmolar contrast material. Appropriately modify contrast protocol ensure adequate cardiac chamber opacification. Review the enhanced phase CT images to ensure adequate anatomic coverage. Prescribe and review delayed images as necessary. Evaluate multiphasic reconstructions for identification of end-systole and end-diastole and determine boundary between myocardium and blood pool. Quantitatively determine ventricular volumes of the heart using dedicated cardiac function analysis software available on the workstation. Quantitatively determine right ventricular volumes of the heart. Calculate ejection fraction, stroke volume and/or cardiac output of both left and right ventricles. Create two-dimensional reconstructions of the heart and adjacent structures, interpret, and annotate. Create three-dimensional reconstructions of the heart and adjacent structures. Adjust the projection of the three-dimensional reconstructions to optimize visualization of anatomy or pathology. Interpret the axial source images of the pre-contrast, arterial phase sequence, and venous phase sequence, as well as the two-dimensional and three-dimensional reformatted images resulting from the study, including cine review. Compare to all pertinent available prior studies.

Description of Post-Service Work:

- Manage complications related to IV, contrast agent, or medications given at the time of the study
- Review and sign the final report for the patient's medical record

Intra-Service intensity/complexity	4.32	4.32
Post-Service intensity/complexity	4.48	4.16

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACC, ACR, ASNC, SCAI, and SCCT convened a panel of physicians that included a number of physicians familiar with this service to review the RUC survey data. The panel noted that 36 percent of survey respondents selected 75564 (Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with flow/velocity quantification and stress) as the reference service for the co 75564 was valued by the RUC in 2007. However, the respondents reported that the new service was only moderate more intense than the key reference service and had 25 minutes less intraservice time than the key reference service. The respondents did indicate that the new service had some greater intensity in some areas, particularly in the outcome depending on the judgment of the physician. The panel felt that the 25th percentile work RVU as reported by those surveyed of 2.55 more appropriately reflected the work level for this service. The panel recommended this 2.55 work RVUs with an intraservice time of 35 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was reported using code 0150T.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Rarely

Specialty Radiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. It is difficult to predict how often this service will be provided in the general population.

Specialty Cardiology Frequency 2200 Percentage 73.33 %

Specialty Radiology Frequency 800 Percentage 26.66 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 200
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. There were 35 services reported using the previously existing T codes in 2007. The service will be infrequently reported in the Medicare population because it is most commonly reported for the pediatric population.

Specialty Cardiology Frequency 150 Percentage 75.00 %

Specialty Radiology Frequency 50 Percentage 25.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Code 75558 should be used as a crosswalk as it has a similar work RVU. The TC PLI RVU should be 0.00.

ndicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

CPT Descriptor: Computed tomographic angiography, heart, coronary arteries and bypass grafts (when present), with contrast material, including 3D image post-processing (including evaluation of cardiac structure and morphology, assessment of cardiac function, and evaluation of venous structures, if performed)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52-year-old female presents for evaluation and possible treatment for chest pain. The pain is described as a retrosternal tightness that radiates to her left shoulder. Her physician determines that she is at intermediate risk for coronary artery disease. Stress evaluations in the past have been non-diagnostic. She is referred for cardiac CT angiography for evaluation of her coronary anatomy and for left ventricular function.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform a E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 4%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

- Review medical record and any applicable prior imaging studies
- Review indication for study and appropriateness
- Review patients symptoms if present
- Review previous cardiac surgical reports
- Review medication list
- Review previous drug allergies and potential contrast allergy
- Determine heart rhythm and need for pharmacological intervention
- Assess baseline heart rate and the need for pharmacological intervention to lower
- Prescribe pharmacological intervention to lower the heart rate if necessary
- Review protocol for examination with technologists and other clinical staff

Description of Intra-Service Work: Describe the procedure to the patient and obtain informed consent where applicable. Review scout views of area to be imaged, axial images of the heart for adequacy prior to transfer to the workstation, and view post-processed images for the presence of calcified coronary atherosclerosis. Coronary artery calcium is quantified using dedicated software that determines the "Agatston Score", the calcified volume and the mass of calcium.

Next, the amount of calcium detected is compared to databases of population data stratified for age and gender. Review non-contrast CT images to localize the vascular phase sequence and to screen those patients who are not candidates for the arterial phase component of the study. Administer IV medication to lower heart rate when necessary and administer IV medication to control heart rhythm when necessary. Manage pacemaker function and rate when applicable. Supervise administration of low- or iso-osmolar contrast material. Appropriately modify contrast protocol to ensure adequate cardiac chamber opacification. Evaluate multiphasic reconstructions for identification of end-systole and end-diastole and determine boundary between myocardium and blood pool. Quantitatively determine ventricular volumes of the heart using dedicated cardiac function analysis software available on the workstation. Calculate ejection fraction, stroke volume and/or cardiac output of both left and right ventricles. Review the arterial phase CT images to ensure adequate anatomic coverage. Prescribe and review delayed images as necessary. Prescribe and review venous phase images as necessary. Create two-dimensional reconstructions of the vasculature, interpret, and annotate. Create three-dimensional reconstructions of the vasculature and associated myocardium. Adjust the projection of the three-dimensional reconstructions to optimize visualization of anatomy or pathology. Interpret the axial source images of the pre-contrast, arterial phase sequence, and venous phase sequence, as well as the two-dimensional and three-dimensional reformatted images resulting from the study, including cine review. Compare to all pertinent available prior studies.

Description of Post-Service Work:

- Manage complications related to IV, contrast agent, or medications given at the time of the study
- Review and sign the final report for the patient's medical record

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
75562	XXX	2.82	**RUC Time**

CPT Descriptor Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with flow/velocity quantification

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99222	XXX	2.56	**RUC Time**	3,285,523

CPT Descriptor 1 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99479	XXX	2.50	**RUC Time**	0

CPT Descriptor 2 Subsequent intensive care, per day, for the evaluation and management of the recovering low birth weight infant (present body weight of 1500-2500 grams)

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 25 **% of respondents:** 33.3 %

TIME ESTIMATES (Median)	CPT Code: 75574	Key Reference CPT Code: 75562	Source of Time RUC Time
Median Pre-Service Time	10.00	10.00	
Median Intra-Service Time	30.00	55.00	
Median Immediate Post-service Time	10.00	10.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	

Prolonged Services Time	0.0	0.00
Median Total Time	**50.00**	**75.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	4.00	4.12
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.94	3.94
Urgency of medical decision making	4.06	3.47

Technical Skill/Physical Effort (Mean)

Technical skill required	4.53	4.53
Physical effort required	2.65	2.53

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	4.00	3.65
Outcome depends on the skill and judgment of physician	4.53	4.47
Estimated risk of malpractice suit with poor outcome	3.82	3.41

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	3.41	3.35
Intra-Service intensity/complexity	4.24	4.47
Post-Service intensity/complexity	3.53	3.41

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used a IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACC, ACR, ASNC, SCAI, and SCCT convened a panel of physicians that included a number of physicians familiar with this service to review the RUC survey data. The panel noted that approximately 23% of respondents chose code

75562 (Cardiac MRI for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with flow/velocity quantification) as the reference service code. This code has a work RVU of 2.86 and has an intraservice time of 55 minutes. The respondents reported that the intensity of the services was similar, higher in some categories and lower in others. The panel felt that respondents may have misallocated the time portions to pre and post service time as opposed to intraservice time. The median reported pre and post times were 15 minutes, both far higher than established standards for similar procedures. However, the panel believes that those surveyed understand how long it takes to perform the complete service and may have assigned work that is in fact part of the intraservice time to the pre and post times. The panel therefore recommends that the median total time of 60 minutes be retained, but the time be altered so that 40 minutes are assigned as intraservice time and 10 minutes each are assigned to pre and post times.

The panel believed that even with this change in time allocations, the recommended work RVU from the survey participants was still too high in comparison to the key reference service code and other services commonly reported by both cardiologists and radiologists. The panel felt that the 25% percentile recommended work RVU of 2.5 more appropriately reflected the level of work that is appropriate for this service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was previously reported using Category III codes 0146T and 0147T and add-on code 0151T. These codes were deleted and reorganized in conversion to Category I codes.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 50000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is difficult to report how often this code will be reported due to rapidly developing technology and evidence. The specialty mix is based on 2007 Medicare claims data.

Specialty Cardiology Frequency 37000 Percentage 74.00 %

Specialty Radiology Frequency 13000 Percentage 26.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimated is based on a review of the 2007 Medicare claims data for the existing Category III codes that were used to report this service.

Specialty Cardiology Frequency 23000 Percentage 76.66 %

Specialty Radiology Frequency 7000 Percentage 23.33 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Crosswalk to code 75557 as it has a similar work RVU. The TC PLI RVU should be 0.00.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor: **Computed tomography, heart, without contrast material, with quantitative evaluation of coronary calcium**

Sample Size: Consensus Panel Response Rate: (%):_____ Global Period: XXX

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The ACC and ACR convened a group of cardiologists and radiologists from a broad range of geographic locations with differing practice circumstances and settings, who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff person will complete required pre-service diagnostic & referral forms, obtain Radiology Quality Initiative (RQI) number - required for CT scans and provide pre-service education to the patient on what to expect for the procedure and obtain consent.

Intra-Service Clinical Labor Activities:

The clinical staff person will review charts, ensures RQI has been obtained, greets the patient and provides a gown, prepare room and supplies and prepares patient for study.

The technologist positions the patient on the CT table, noncontrast CT images are then obtained to localize the appropriate area to be scanned in the vascular phase. A test bolus is injected to confirm optimum timing for the diagnostic scan. The source axial images are obtained. Performance of limited reconstruction assess each phase for motion artifact. With the physician's assistance, 2-D reconstructions of the vasculature are created.

The technologist finds and reviews appropriate previous studies and assembles them for physician's review

Post-Service Clinical Labor Activities:

The clinical staff will also call in any prescriptions and coordinate follow-up care.

CPT Long Descriptor: **Computed tomography, heart, with contrast material, for evaluation of cardiac structure and morphology (including 3D image post processing, assessment of cardiac function, and evaluation of venous structures, if performed)**

Sample Size: Consensus Panel Global Period: XXX

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
The ACC and ACR convened a group of cardiologists and radiologists from a broad range of geographic locations with differing practice circumstances and settings, who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff person will complete required pre-service diagnostic & referral forms, obtain Radiology Quality Initiative (RQI) number - required for CT scans, provide pre-service education to the patient on what to expect for the procedure and obtain consent.

The RN will complete the required prescription for beta-blocker, calcium channel blocker, and/or acetylcysteine and provide to patient prior to procedure.

Intra-Service Clinical Labor Activities:

The clinical staff person will review charts, ensure RQI number has been obtained, greets the patient and provides a gown, prepare room and supplies and prepares patient for study.

The RN meets patient and questions them regarding contrast allergies. The RN explains the feelings the patient will experience during contrast injection and the importance of remaining motionless. An IV is started. The IV must be adequate to accommodate high volume rapid power injection and thus must be angiocath. The RN supervises the contrast injection. The patient is counseled regarding post contrast thrombophlebitis and delayed reactions to contrast. The technologist positions patient for study. Noncontrast CT images are obtained to localize the appropriate area to be scanned in the vascular phase. A test bolus is injected to confirm optimum timing for the diagnostic scan. The source axial images are obtained. Arterial phase images are technically reviewed for appropriate anatomic coverage. The patient is assisted from the CT table when it has been ascertained that the original images are satisfactory. The technologist finds and reviews appropriate previous studies and assembles them for physician's review. With the physicians's assistance, 2-D reconstructions of the vasculature are created. 3-D reconstructions of the vasculature are also created. Creation of 2-D and 3-D reconstructions typically require more than one attempt for optimum visualization of anatomy and pathology.

Post-Service Clinical Labor Activities: The clinical staff will also call in any prescriptions and coordinate follow-up care.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Multi-Leaf Collimator IMRT Device Use

In October 2008 the CPT Editorial Panel created a new code to describe the design and construction of multi-leaf collimator (MLC) intensity modulated radiation therapy (IMRT) device use. Previously, patients treated with IMRT were reported under code 77334 *Treatment devices, design and construction; complex (irregular blocks, special shields, compensators, wedges, molds or casts)* (work RVU = 1.24). However, the technical component expense portion was incorrectly captured in the practice expense of code 77418 *Intensity modulated treatment delivery, single or multiple fields/arcs, via narrow spatially and temporally modulated beams, binary, dynamic MLC, per treatment session*, not under code 77334.

The RUC reviewed 77338 *Multi-leaf collimator (MLC) device(s) for intensity modulated radiation therapy (IMRT), design and construction, per IMRT plan*. The specialty societies indicated that 77338 captures the appropriate physician work and practice expense, specifically the medical physics and medical dosimetry time and equipment that was not in code 77418. The specialty societies indicated that the physician work starts at the time following treatment plan 77301 *Intensity modulated radiotherapy plan, including dose-volume histograms for target and critical structure partial tolerance specifications* (work RVU = 7.99). Multiple fluence patterns are generated and the physician must review the plan and make the proper adjustments to the MLC device prior to treatment to protect normal surrounding tissue (i.e., bladder, anterior rectal wall, etc). The physician selects a range set of segments for each device, fine tunes and deletes small segments to eliminate any treatment inefficiency and adjusts the dose profile again for every beam (typically 9 beams). The specialty society indicated and the RUC agreed that the physician work required to adjust each beam is approximately 13 minutes per beam (total intra-service time = 115 minutes). The specialty society indicated that each fluence map is different for every beam so each requires approximately the same amount of time, in other words, each additional beam would not require less time nor would the physician become more efficient.

The specialty society indicated and the RUC agreed that the survey 25th percentile work RVU of 4.29 appropriately accounted for the work required to perform this service. The RUC compared 77338 to reference service 77295 *Therapeutic radiology simulation-aided field setting; 3-dimensional* (work RVU = 4.56 and 98 minutes intra-service time) and determined that although the reference code requires less physician time, it is slightly more intense and complex to perform than 77338. Additionally, the RUC compared 77338 to the physician work that is currently reported as 77334 *Treatment devices, design and construction; complex (irregular blocks, special*

shields, compensators, wedges, molds or casts) (work RVU = 1.24, intra-service time = 35 minutes), which is reported per field. The IWPUT for CPT 77334 (0.035) when compared to the survey physician time for 77338 (115 minutes) supports the survey 25th percentile RVU recommended by the specialty society (0.035 x 115 = 4.03). **The RUC recommends the survey 25th percentile work RVU of 4.29 for code 77338.**

Practice Expense

The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

PLI

The RUC recommends the PLI for 77338 be crosswalked to 77295 *Therapeutic radiology simulation-aided field setting; 3-dimensional* and a 0.00 PLI for the technical component only.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●77338	J1	Multi-leaf collimator (MLC) device(s) for intensity modulated radiation therapy (IMRT), design and construction, per IMRT plan (For immobilization in IMRT treatment, use 77332-77334) (Do not report 77338 more than once per IMRT plan) (Do not report 77338 in conjunction with 0073T, compensator based IMRT)	XXX	4.29

(Do not use with 0073T, compensator based IMRT)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Following clinical treatment planning (77261-77263), simulation (77280-77290), and creation of the treatment isodose for a nine field IMRT plan (77301), a 65 year old man with stage T2a, N0, M0 adenocarcinoma of the prostate who will be treated with IMRT presents for design and construction of the nine custom MLC devices required for delivery of the IMRT treatment.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: Physician work on the multi-leaf collimator (MLC) treatment device begins after the intensity modulated plan (77301) has been generated. This plan will have achieved satisfactory compliance with the prescribed tumor and normal tissue dose specifications by modulating the intensity of the radiation beam through separate beam positions/angles (typically 9). This dose modulation per beam angle is displayed as fluence maps. The physician work for the IMRT device is associated with the work of converting the fluence map for each beam into a series of small segments shaped by multileaf collimators and the ongoing revision and adjustments to these devices to assure that the final device shape achieves the necessary dose modulation from each beam.

The physician reviews with the dosimetrist the combination of beam angles and MLC segments that have been generated to produce the intended cross-sectional beam intensity profile. For each modulated beam, the dosimetrist operates the planning software to provide a digitally reconstructed radiograph that represents the maximum aperture of each MLC-

shaped field. For each individual beam, the MD and dosimetrist consider the component segments (typically around 20 to 30 per beam), taking into consideration both the pertinent anatomic relationships (e.g., avoidance of unintended entrance or exit dose to a structure remote from the tumor that was not accounted for in the initial planning) and practical considerations (e.g. avoidance of the need for the patient to be immobilized for an excessive length of time or othe obvious inefficiency in treatment delivery e.g. removal of very small segments which contribute minimal dose). This repeated for each beam angle. The entire set of MLC segment combinations (the IMRT Treatment Device) has to be evaluated by the radiation oncologist, since modification of any one might require compensatory modification of the others to achieve the required fluence.

As modifications occur, the physician reviews these with the physicist and then the dosimetrist, who recalculates the desired dose distribution based on the modified MLC patterns. The final device is then generated and shaped using the MLC shaper and uploaded onto the information system platform.

After the final device is uploaded on the information system the physician reviews each device on the information system for accurate transfer of information and electronically approves the composite MLC device and authorizes its release to the treatment machine for use throughout the specified course of therapy.

Description of Post-Service Work:

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2009

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ASTRO's consensus panel carefully considered survey data, current coding conventions, IWPUT and recommends a value of 4.29 RVUs for CPT code 77338.

The work described by this new CPT code is currently billed with CPT 77334, billed per field (9).

CPT code 77334 (recently RUC reviewed/surveyed) currently has:
35 minutes of time
RVU of 1.24
IWPUT of 0.035

This new CPT code will be billed once per IMRT plan, not per field. An additional question was added to our survey to query our survey respondents regarding the typical number of treatment fields. The median number of treatment fields was nine (9).

The median time for the new CPT code 77338 is 115 minutes. That would represent approximately 13 minutes per treatment field. The consensus panel felt that time was appropriate.

When taking the 115 minutes of time for the new CPT code 77338, multiplied by the IWPUT for CPT code 77334 (0.035) the result is 4.03. The result 4.03 is very similar to our 25th percentile survey data of 4.29.

The results for an RVU recommendation of 4.29 will result in an IWPUT of 0.037, very similar to the IWPUT for CPT code 77334 (0.035).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code may be reported on same date of service as other codes depending on the pace and flow of the process of care as the patient is prepared to receive IMRT. The code 77301 describes the work of IMRT computer plan development, but typically takes many days to complete. As a matter of convenience, reporting this code on the same day as this new code could occur. The work and practice expense for these codes are separate and distinct.

5. 77301	XXX	7.99	30	131	35	196

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT Code 77334 times the number of treatment fields

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 117000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that for the Medicare population in 2006, CPT® code 77301, Intensity modulated radiotherapy plan, including dose-volume histograms for target and critical structure partial tolerance specifications, was billed approximately 66,600 times. The 2007 Medicare data estimates that CPT code 77301 was billed approximately 78,000 times. The overall number of services for 77301 in a one year period is estimated to be 117,000.

Specialty Radiation Oncology Frequency 117000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 78,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that for the Medicare population in 2006, CPT® code 77301, Intensity modulated radiotherapy plan, including dose-volume histograms for target and critical structure partial tolerance specifications, was billed approximately 66,600 times. The 2007 Medicare data estimates that CPT code 77301 was billed approximately 78,000 times.

Specialty Radiation Oncology Frequency 78000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Use code 77295 as a crosswalk as it has a similar work RVU. Recommend 0.00 TC only PLI RVUs.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

CPT Long Descriptor: Multi-leaf collimator (MLC) device(s) for intensity modulated radiation therapy (IMRT), design and construction

(For immobilization in IMRT treatment, use 77332-77334)
(Do not use with 0073T, compensator based IMRT)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
ASTRO developed these PE recommendations by Consensus Panel. The Panel had several radiation oncologists and medical physicists. The Panel reviewed the RUC physician work survey data carefully. The group also reviewed the CPEP inputs for several other radiation oncology codes billed for IMRT patients. As requested, two of these CPT codes (77334 and 77418) appear on the PEAC spreadsheet to serve as a reference to the PEAC. Finally, the Panel also conducted several "time motion" studies to develop and finalize these PE recommendations.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities: NONE

Intra-Service Clinical Labor Activities:
The dosimetrist/medical physicist loads the IMRT plan with associated fluence patterns. The dosimetrist/medical physicist reviews the fluence patterns from the IMRT plans and then constructs the MLC motion pattern to produce the desired fluence or reviews and adjusts the MLC position and segment number constraints. The MLC position set is then created using the radiation treatment planning (RTP) system and/or MLC shaper system. The dosimetrist/medical physicist then modifies individual leaf positions to reduce or increase dose as necessary. Repeat for each of the 9 fields. Dose is recalculated based on modified patterns is necessary.

The medical physicist will then review each resultant MLC segment, digitally overlaid on the region of interest, for conformality and appropriateness of position. The medical physicist will modify individual leaf positions to remove inappropriate MLC leaf positions and review all segments to confirm an appropriate minimum number of monitor units per segment based on leaf speed and maximum leaf travel. This process is repeated for all 9 fields. After all changes are made, the medical physicist operates the software that recalculates the resultant MLC driven fluence and reviews the effect on the final dose distribution. The process is then repeated for both the initial and any separate boost IMRT segments.

The dosimetrist formats and prints the final MLC pattern map for entry into the patient's chart. The dosimetrist then uploads into the record and verify software that controls the linear accelerator's treatment delivery performance the information that defines each beam's MLC pattern of segments, confirming that each set of independent jaw positions and leaf positions are accurately transferred and repeating for each field

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Tissue Examination for Molecular Studies

The CPT Editorial Panel created two CPT codes to report tissue examination and preparation procedures, which have become necessary to avoid contamination with other tissue or cell types that may cause false-positive results in certain molecular diagnostic procedures. These codes will be used to report services that need to be performed prior to ancillary diagnostic testing currently applicable to molecular studies. One example of the use of these codes is for the evaluation of sentinel lymph node biopsies requiring molecular analysis.

The RUC reviewed the surveyed data and expressed concern about the low sample size for both of these new codes. The specialty societies explained that they would consider their utilization estimate of 1,000 to be a small number of assays for a laboratory procedure. They explained that when specialized laboratory tests are performed only 1,000 to 3,000 times per year there is not a large number of laboratories doing them because most laboratories cannot afford the specialized equipment. Therefore, there is not a large number of providers for these services. The specialty society contacted all providers of this service and requested them to complete a survey. The data presented to the RUC is the data collected from these few providers. The RUC determined that based on this explanation provided by specialty society, the survey was valid.

394

88387 Macroscopic examination, dissection and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid – based molecular studies); each tissue preparation (eg, a single lymph node)

The RUC reviewed the survey data for 88387 as compared to the key reference code 88381 *Microdissection (ie, sample preparation of microscopically identified target); manual* (Work RVU=1.18) and noted that the intra-service time for surveyed code was less than for the reference code, 20 minutes and 30 minutes, respectively. Further, the RUC compared the surveyed code to another reference code, MPC code 29075 *Application, cast; elbow to finger (short arm)* (Work RVU=0.77) and noted that the surveyed code has less total service time as compared to this reference code, 20 minutes and 25 minutes, respectively. In addition, the RUC compared the intensity/complexity measures of 88387 to its reference code 88381 and determined that the reference code required more technical skill and physical effort and the same mental effort and judgment to perform as compared to the surveyed code. Based on these

comparisons, the RUC agreed with the specialty societies' recommended value of 0.62 RVUs which is the survey's 25th percentile. **The RUC recommends 0.62 Work RVUs for 88387.**

88388 Macroscopic examination, dissection and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid – based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node)

The RUC reviewed the survey data for 88388 as compared to the reference code 88334 *Pathology consultation during surgery; cytologic examination (eg, touch prep, squash prep), each additional site* (Work RVU=0.73) and noted that the intra-service time for surveyed code was less than for the reference code, 12 minutes and 20 minutes, respectively. Further, the RUC compared the surveyed code to another reference code, 77071 *Manual application of stress performed by physician for joint radiography, including contralateral joint if indicated* (Work RVU=0.41) and noted that the surveyed code has similar total service time as compared to this reference code, 12 minutes and 11 minutes, respectively. In addition, the RUC compared the intensity/complexity measures of 88388 to its reference code 88334 and determined that the reference code required more technical skill, physical and mental effort and judgment to perform as compared to the surveyed code. Based on these comparisons, the RUC agreed with the specialty societies' recommended value of 0.45 RVUs which is the 25th percentile. **The RUC recommends 0.45 Work RVUs for 88388.**

395

New Technology List:
As there are now so few laboratories performing this service and the number of respondents were so low, the RUC agreed with the specialty societies' recommendation that these codes should be placed on the New Technology List.

Practice Expense:
The RUC approved the practice expense inputs as recommended by the specialty societies with the substitution of an impervious gown instead of a staff lab coat.

PLI Crosswalk:
As the reference codes used for both of these surveyed codes were not similarly valued, the RUC requested a different code for the PLI crosswalk. The specialty society recommends CPT code 88329 *Pathology consultation during surgery;* (Work RVU=0.67) be the crosswalk for 88387 and 88318 *Determinative histochemistry to identify chemical components (eg, copper, zinc)* (Work RVU=0.42) be the crosswalk for 88388. The RUC agreed with these new PLI crosswalks and deemed them to be more appropriate as they were similarly valued to the recommended values of the surveyed codes.

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work:

Description of Intra-Service Work: The pathologist receives the specimen fresh and uses sterile technique and careful dissection to examine for nodal tissue. The pathologist finds a 1.0 cm. lymph node and carefully dissects it from the surrounding fat. Because molecular studies may be done on the lymph node tissue, special precautions are taken for the handling and processing of the nodal tissue. Each lymph node is handled on a sterile surface to avoid contamination with breast tissue or primary tumor that can yield false positive assay results on subsequent molecular studies. If more than one sentinel node is obtained, these are also processed separately to avoid a positive node contaminating a negative node. The pathologist then sections cleaned nodal tissue and does not see tissue suspicious for cancer. The node is parsed by the pathologist into subparts each approximately 2 mm in thickness. To further assess the node, alternating 2 mm subparts (in total one half the node) are tested using a molecular assay that targets a marker specific to breast tissue First, the pathologist labels the nodes with the patient's identification number and with the node number. This is done fo all sentinel nodes while keeping the tissue from each node in separate containers. Next, the tissue is carefully prepared for molecular analysis.

Description of Post-Service Work:

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ollowing the survey, the CAP determined that an Expert Panel was needed to further evaluate the data. The data were eviewed by an Expert Panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor and included representatives from the general and academic pathology practice settings. The Panel also included a molecular pathologist who actively performs the surveyed service, since this CPT code represents new technology and this service is not currently performed by most general pathologists.

The Expert Panel recommends the RVW value of 0.62.

The Panel took these steps in reaching their conclusion:

1) Reviewed the survey results
2) Compared the recommended RVW, time and intensity/complexity of 8838X1 to the reference service 883 *Microdissection (ie, sample preparation of microscopically identified target); manual* and,
3) Compared other services/procedures on the MPC List to the recommended RVW and time of 8838X1

Review of Survey Results

The Expert Panel felt the survey respondents fairly estimated the physician work time of 20 minutes, but that the survey median RVW of 1.18 was too high. Code 8838X1 has approximately the same intensity/complexity as the reference service code 88381 *Microdissection (ie, sample preparation of microscopically identified target); manual* but with ten fewer minutes. The Panel's expert verified that the time of 20 minutes was correct for 8838X1, and that the intensity and complexity overall was about the same as that of the reference service. The Panel also looked at other services/procedures with the same total time as the new code, and felt the 25% survey value of 0.62 RVW was appropriate.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) No

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:88388 Tracking Number II2 Specialty Society Recommended RVU: **0.45**

Global Period: ZZZ RUC Recommended RVU: **0.45**

CPT Descriptor: Macroscopic examination, dissection and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid - based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node) (List separately in addition to code for primary procedure)

(Use 88388 in conjunction with 88329-88334)

(Do not use 88387 or 88388 for tissue preparation for microbiologic cultures or flow cytometric studies)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A woman has the diagnosis of breast cancer and the surgeon performs a "sentinel lymph node biopsy" and requests a frozen section or touch imprint in addition to further analytic studies.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The pathologist receives the specimen fresh. Because molecular studies will need to be performed on this specimen, the pathologist cannot use the typical frozen section protocol when initiating examination of the tissue.
Instead, the pathologist prepares the dissection area by using a sterile dissection field. This means the use of a sterile cutting board. The pathologist uses sterile technique and careful dissection to examine for nodal tissue. The pathologist finds a 1.0 cm. lymph node and carefully dissects it from the surrounding fat. Because molecular studies may be done on the lymph node tissue, special precautions are taken for the handling and processing of the nodal tissue. Each lymph node is handled on a sterile surface to avoid contamination with breast tissue or primary tumor that can yield false positive assay results on subsequent molecular studies. If more than one sentinel node is obtained, these are also processed separately (each on its own dissection board) to avoid a positive node contaminating a negative node.
The pathologist then sections cleaned nodal tissue and does not see tissue suspicious for cancer. The node is parsed by the pathologist into even numbers of subparts of approximately 2 mm in thickness.

At this point the pathologist performs a frozen section or touch imprint and finds no malignant cells.
Because no malignant cells were found by either frozen section (or touch imprint cytology), the pathologist returns to the node(s). Next, the tissue is carefully prepared for molecular analysis.

Description of Post-Service Work: N/A

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used a IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the CAP determined that an Expert Panel was needed to further evaluate the data. The data were reviewed by an Expert Panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor and included representatives from the general and academic pathology practice settings. The Panel also included a molecular pathologist who actively performs the surveyed service, since this CPT code represents new technology and this service is not currently performed by most general pathologists.

The Expert Panel recommends the RVW value of 0.45.

The Panel took these steps in reaching their conclusions:

1) Reviewed the survey results
2) Compared the recommended RVW, time and intensity/complexity of +88388 to the reference service 88334 *Pathology consultation during surgery; cytologic examination (eg, touch prep, squash prep), each additional site* and,
3) Compared other services/procedures on the MPC List to the recommended RVW and time of +88388

Review of Survey Results

The Expert Panel upon review of the raw survey data suspected that some of the survey respondents may have included some of the work time of performing the touch prep or frozen section into the total time for the surveyed code. The molecular pathologist indicated that she had included a portion of the frozen section time into the total time for +88388. The Panel reduced the total minutes to 12.5, by eliminating the pre- and post-time.

After reducing the total work time of +88388 down by 46%, the Panel then considered the appropriate work RVW. One half of the median survey RVW (0.59) was considered, but the Panel felt this value was too high since the intensity/complexity of +88388 was less than that of the reference service 88334. The Key MPC Comparison codes were reviewed in terms of both total time and intensity/complexity compared to this new code. Based on this comparison, the Panel agreed that an RVW value of 0.45 is most appropriate.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. (Do not use 88387 for tissue preparation for microbiologic cultures or flow cytometric studies)

(Do not use 88387 in conjunction with 88388, 88329-88334)

+88388 Macroscopic examination, dissection and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid – based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node) (List separately in addition to code for primary procedure)

(Use 88388 in conjunction with 88329-88334)

(Do not use 88387 or 88388 for tissue preparation for microbiologic cultures or flow cytometric studies)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Data were developed by CAP's relative value workgroup which includes the American Society of Cytopathology (ASC) RUC advisor and representatives from the general and academic pathology practice settings. Molecular pathologists who actively perform the services were also consulted during the data development.

See Excel spreadsheet for labor, supplies and equipment detail.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Peripheral Electrical Bioimpedance

In October 2008, the CPT Editorial Panel revised code 93701 *Bioimpedance derived physiologic cardiovascular analysis* to fully describe all types of bioimpedance procedures presently in use. In 2001, the RUC recommended 0.00 physician work RVUs for 93701, as the physician work of reviewing this computer generated report is included as part of an associated E/M service. The RUC agreed the change was editorial. **The RUC reaffirmed their previous recommendation and recommends 0.00 work RVUs for 93701.**

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Infant Pulmonary Function Testing

In February 2009, the CPT Editorial Panel created three new CPT codes to describe the infant standard pulmonary function testing (PFT) that replicates adult PFTs with sedated infants or young children.

The specialty societies performed a survey of 40 physicians performing infant PFT in the U.S. The specialty acknowledged its low response rate of 26 may have contributed to the improper rank order of survey median physician work 94012 and 94013. The RUC reviewed these three new services, which are only performed in the facility setting, in relation to survey results and specialty recommended physician time and work effort in relation to other services to develop the recommendations.

415

94011 Measurement of spirometric forced expiratory flows in an infant or child through 2 years of age
The RUC reviewed the specialty survey and specialty recommendations for new code 94011 and understood that the reduced pre-service time of 30 minutes (evaluation time only) from the standard package for a difficult sedated patient/straightforward procedure (33 minute evaluation time/1 minutes positioning time/5 minutes scrub, dress, wait time), appeared justified since the pediatric pulmonologists performing this test typically differs from the treating physicians (either pediatric pulmonologist or other physicians) with whom the family has a relationship established. Parents usually are shown the equipment (a clear body box that the infant is placed in, an airtight face-mask to be secured to the infant, and a pneumatic vest) as part of the informed consent process.

In support of the surveyed intra-service time (30 min), the RUC understood that infant PFTs include moderate sedation, as the physician actively performs the test. The technician calibrates the equipment, and assists in any resuscitation efforts. After the service, the physician speaks with the parents and the referring physician, and interprets the data in these difficult infants with cystic fibrosis. The RUC concurred that the correct physician time components for 94011 are 30 minutes pre-service, 30 minutes intra-service, and 20 minutes immediate post totaling 80 minutes.

The specialty recommended the survey median work RVU of 2.00 and the survey median physician time. In relation to this service, the RUC also reviewed the physician work of CPT code 99480 *Subsequent intensive care, per day, E/M of recovering infant 2501-*

5000g (Work RVU = 2.40), 94002 *Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, initial day* (Work RVU = 1.99 RVU), and 93312 *Echocardiography, transesophageal, real-time with image documentation (2D) (with or without M-mode recording); including probe placement, image acquisition, interpretation and report* (Work RVU = 2.20), and agreed with the recommended value for 940X1 of 2.00. **The RUC recommends the survey median relative work value of 2.00 for CPT code 94011.**

94012 Measurement of spirometric forced expiratory flows before and after bronchodilator in an infant or child through 2 years of age

The specialty recommended the survey median time, but argued that the survey median was too low. The RUC reviewed the specialty survey and specialty recommendations for new code 94012 and understood that the reduced pre-service time of 30 minutes (evaluation time only) from the standard package for a difficult sedated patient/straightforward procedure (33 minute evaluation time/1 minutes positioning time/5 minutes scrub, dress, wait time), appeared justified since the pediatric pulmonologists performing this test typically differs from the treating physicians (either pediatric pulmonologist or other physicians) with whom the family has a relationship established. Parents usually are shown the equipment (a clear body box that the infant is placed in, an airtight face-mask to be secured to the infant, and a pneumatic vest) as part of the informed consent process.

In support of the surveyed intra-service time (60 min), the RUC understood that infant PFTs include moderate sedation, and the physician actively performs the test, however in addition, the child is administered a bronchodilator after the first set of measurements, 10 minutes waiting time is necessary to permit the effect of albuterol (J code separately reported), 25 minutes additional time for making measurements. The RUC concurred that the survey respondents misunderstood this service in relation to 94011 and 94012, which provided for a disproportionately low value amongst this family of services.

The RUC developed a building block methodology to establish an appropriate work RVU. The RUC used 94011 as the base code that contains 30/30/20=80 total minutes of time and a RUC recommended value of 2.00. The survey indicated 94012 had 30 additional minutes of intra-service time above 94011. RUC took the intra-service work per unit of time (IWPUT) of 94011 (0.044) and multiplied it by the additional 20 minutes of active intra-service time for 94012, yielding 0.88 RVUs (20 x 0.044), then added the additional 10 min waiting intra-service time (10 x 0.0224 = 0.22 RVU), for a total of 1.10 RVUs (0.88+0.22 = 1.10). When added to the 2.00 RVUs from base code, 94011, this yields 3.10 work RVUs.

In relation to this service, the RUC also reviewed the physician work of CPT code 99480 *Subsequent intensive care, per day, E/M of recovering infant 2501-5000g* (Work RVU = 2.40), 96111 *Developmental testing; extended (includes assessment of motor, language,*

social, adaptive and/or cognitive functioning by standardized developmental instruments) with interpretation and report (Work RVU = 2.60 RVU), and 75563 *Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with stress imaging* (work RVU = 3.00). and agreed with the recommended value for 94012 of 3.10 work RVUs. **The RUC recommends a relative work value of 3.10 for CPT code 94012.**

94013 Measurement of lung volumes (ie, functional residual capacity [FRC], forced vital capacity [VVC], and expiratory reserve volume [ERV]) in an infant or child through 2 years of age

The specialty recommended that the survey results for this code were flawed, as the respondents did not understand that the service was essentially an add-on service. The RUC reviewed the specialty's survey results and understood that the work of 94013 occurs after spirometry measures are obtained with 94011 or 94012, the lungs are inflated passively, with another series of tests performed. The RUC agreed that the survey respondents did not understand the code being surveyed, and responded as if they were repeating the 94011. Therefore, the RUC removed all the pre-service time, reduced the intra-service time from the survey median of 42.5 minutes by 30 minutes to account for duplicative work performed in 94011, which left 12.5 minutes of intra-service time for 94013. The RUC also subtracted duplicative post-service time, resulting in 5 minutes of post-service time for interpretation of the data and relaying the results to the family.

417

The RUC used a building block methodology using 94002, *Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, initial day* (work RVU = 1.99) as a building block base code to arrive at the value for 94013. The RUC used an IWPUT of 0.044 RVU per minute for the 12.5 minutes of intra-service work yielding 0.55 work RVUs. The 5 minutes post-service time at 0.0224 RVU per minute yields another 0.11 work RVUs to total a recommended 0.66 work RVUs for 94013. This code may be used twice if performed after both the initial testing and the post-bronchodilator study. The typical scenario is for 94013 to be used as an add-on code to 94011 or 94012, but could also be used as a stand alone code.

In relation to this service, the RUC also reviewed the physician work of CPT code 94620, *Pulmonary stress testing; simple (eg, 6-minute walk test, prolonged exercise test for bronchospasm with pre- and post-spirometry and oximetry)* (work RVU = 0.64, intra-service time = 15 minutes) and agreed that the services are similar, though 94013 requires greater intensity particularly because of the nature of the young patients. The RUC also reviewed 94070, *Bronchospasm provocation evaluation, multiple spirometric determinations as in 94010, with administered agents (eg, antigen[s], cold air, methacholine)* (work RVU = 0.60, intra-service time = 15 minutes, Harvard time), 92615, *Flexible fiberoptic endoscopic evaluation, laryngeal sensory testing by cine or video recording; physician interpretation and report only* (work RVU = 0.63, intra-time = 10 minutes), 93279, *Programming device evaluation with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with*

physician analysis, review and report; single lead pacemaker system (work RVU = 0.65, intra-time = 10 minutes) and 95937, *Neuromuscular junction testing (repetitive stimulation, paired stimuli), each nerve, any one method* (work RVU = 0.65, intra-time = 12 minutes) and agreed with the recommended value for 940X3 of 0.66. **The RUC recommends a relative work value of 0.66 for CPT code 94013.**

New Technology: The RUC recommends that these services be placed on the RUC's New Technology list to be re-reviewed after 3 years of claims data are available.

Practice Expense: The RUC recommends no direct practice expense inputs for this set of codes as they are always performed in the facility setting.

CPT Descriptor: Measurement of spirometric forced expiratory flows in an infant or child through 2 years of age

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 5-month-old girl with cystic fibrosis has a chronic cough. An infant pulmonary function test is ordered to determine if there are abnormalities in forced expiratory flows.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Percent of survey respondents who stated they perform the procedure; In the hospital 96% , In the ASC 96%, In the office 19%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

's moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
ercent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 100%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: * The pre-service work is different from the work of an Evaluation and Management Service where the determination is made that spirometry be performed, and is not provided on the same day as Infant PFT. Often a different physician performs the test than the provider ordering it. This procedure is performed in a specialized room. The physician reviews the patient record. The procedure is explained with any potential complications to the parents. Informed consent is obtained including showing the parent the equipment and explaining the procedure. Instructions provided to RN/RT staff.The physician is present for its duration.

Description of Intra-Service Work: *The infant is sedated following the sedation proctocol and completes the paperwork with a review of the medication list, the vital signs and that the patient is npo. If the child awakens during the procedure, repeat sedation is administered.
* The mask is tightly sealed over the infants nose and mouth.
*The infant is placed inside an airtight, transparent box.
*A series of measurements are made before, during and after mechanically squeezing of the chest using a pneumatic vest. Repeated cycles are obtained to insure valididity.
requently the box must be opened and the infant repositioned in order to ensure a tight seal of the mask over the fant's face.

Description of Post-Service Work: * The physician evaluates the data to ensure accuracy, including review of the mid-maximal flow rates, examination of the flow-time curves, and comparision to available previous studies for significant

interval change according to the ATS/ERS Consensus Statement. The physician documents the results in the medical record. The patient is observed for any side effects from the sedation and then discharged into the care of the family.
* The physician discusses the results with the patient/family, and communicates the results to the referring physician.

dditional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACCP and ATS worked with AAP and derived a consensus recommendation through our respective committees.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) NOT REPORTED

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary Medicine How often? Rarely

Specialty Pediatrics How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 720
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty Pulmonary Medicine Frequency 720 Percentage 100.00 %

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 99480

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:94012 Tracking Number KK2 Specialty Society Recommended RVU: **3.10**

Global Period: XXX RUC Recommended RVU: **3.10**

CPT Descriptor: Measurement of spirometric forced expiratory flows before and after bronchodilator in an infant or child through 2 years of age

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 4-month-old boy has a chronic cough. An infant pulmonary function test is ordered to determine if there are abnormalities in forced expiratory flows and if they are reversible by a bronchodilator.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Percent of survey respondents who stated they perform the procedure; In the hospital 96% , In the ASC 96%, In the office 19%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 100%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: * The pre-service work is different from the work of an Evaluation and Management Service where the determination is made that spirometry be performed, and is not provided on the same day as Infant PFT. Often a different physician performs the test than the provider ordering it. This procedure is performed in a specialized room. The physician reviews the patient record. The procedure is explained with any potential complications to the parents. Informed consent is obtained including showing the parent the equipment and explaining the procedure. Instructions provided to RN/RT staff.The physician is present for its duration.

Description of Intra-Service Work: * The infant is sedated following the sedation proctocol and completes the paperwork with a review of the medication list, the vital signs and that the patient is npo.
*The mask is tightly sealed over the infants nose and mouth.
*The infant is placed inside an airtight, transparent box.
*A series of measurements are made before, during and after mechanically squeezing of the chest using a pneumatic vest. Repeated cycles are obtained to insure valididity.
*Frequently the box must be opened and the infant repositioned in order to ensure a tight seal of the mask over th infant's face.
*A bronchodilator is then administered after which the physician must wait for its effects. The above procedure is then repeated.
*If the child awakens, repeat sedation is administered.

Description of Post-Service Work: * The physician evaluates the data to ensure accuracy, including review of the mid-maximal flow rates, examination of the flow-time curves, and comparision to available previous studies for significant interval change according to the ATS/ERS Consensus Statement. The physician documents the results in the medical record. The patient is observed for any side effects from the sedation or bronchodilator and then discharged into the care of the family.

Post-Service intensity/complexity	3.00	2.55

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used a IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACCP and ATS worked with AAP and derived a consensus recommendation through our respective committees.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

CPT Descriptor: Measurement of lung volumes (ie, functional residual capacity [FRC], forced vital capacity [FVC], and expiratory reserve volume [ERV]) in an infant or child through 2 years of age

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 9-month-old girl has survived perinatal lung surgery to remove a congenital cystic adenomatous malformation. Lung volumes are being assessed to determine compensatory growth.

Percentage of Survey Respondents who found Vignette to be Typical: 77%

Percent of survey respondents who stated they perform the procedure; In the hospital 96% , In the ASC 96%, In the office 19%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 100%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 4%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: * The pre-service work is different from the work of an Evaluation and Management Service where the determination is made that spirometry be performed, and is not provided on the same day as Infant PFT. Often a different physician performs the test than the provider ordering it. This procedure is performed in a specialized room. The physician reviews the patient record. The procedure is explained with any potential complications to the parents. Informed consent is obtained including showing the parent the equipment and explaining the procedure. Instructions provided to RN/RT staff. The physician is present for its duration..

Description of Intra-Service Work: *The infant is sedated following the sedation proctocol and completes the paperwork with a review of the medication list, the vital signs and that the patient is npo. If the child awakens during the procedure, repeat sedation is administered.
*The mask is tightly sealed over the infants nose and mouth.
*The infant is placed inside an airtight, transparent box.
*A series of measurements are made before, during and after mechanically squeezing of the chest using a pneumatic vest. Repeated cycles are obtained to insure valididity.
Frequently the box must be opened and the infant repositioned in order to ensure a tight seal of the mask over the infant's face.
*The infant's lungs are then passively inflated to total lung capacity. The above procedure is then repeated with multiple measurements after passive inflation.

Description of Post-Service Work: * The physician evaluates the data to ensure accuracy, including review of the mid-maximal flow rates, examination of the flow-time curves, and comparision to available previous studies for significant interval change according to the ATS/ERS Consensus Statement. The physician documents the results in the medical record. The patient is observed for any side effects from the sedation or bronchodilator and then discharged into the care of the family.

* The physician discusses the results with the patient/family, and communicates the results to the referring physician.

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Pleas explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 94070

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Nerve Conduction Tests

The CPT Editorial Panel created one new Category I CPT code to describe a new nerve conduction test performed with newer technologies that differ from traditional technologies. The Editorial Panel created, 95905, *Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study; each limb, includes F-wave study when performed, with interpretation and report* at its October 2008 Meeting. The Editorial Panel specified that this codes may be reported only once per limb studied.

The specialty societies presented survey data from 75 physicians; however, the median service performance rate of all surveyees was zero. Following RUC policy, the specialties provided additional data from their original survey, including the compilation of responses from physicians with a service performance rate of at least one and the compilation of responses from physicians with a service performance rate of zero, which the RUC compared with the aggregate data in the Summary of Recommendation form. The specialties also provided a complete description of the work that is included in the procedure to support the contention that there is physician work involved since it was noted that 21 of the survey respondents compared the new code to a reference code with no physician work. Based on this description and the overall survey results, the RUC agreed that although the median survey work RVUs and some of the surveyed physician times are inflated, a small amount of physician work is appropriate. The RUC reviewed the times recommended by the specialties and noted that there is no pre-service or post-service physician time and that the physician work is only performed during the intra-service period. Specifically, the RUC decided that the physician work described by the specialties within the pre-service time is included within the evaluation and management service that is typically reported on the same day and that the physician work described by the specialties within the post-service time is inappropriate and is included within the five minutes of intra-service time. The RUC compared 95905 to 76977, *Ultrasound bone density measurement and interpretation, peripheral site(s), any method* (work RVU = 0.05, intra-service = 5 minutes), which is identical in physician time and work. The RUC agreed that 76977 serves as a direct comparison code and the appropriate work RVU for 95905 is 0.05, based on this magnitude estimation. The Committee also noted that 0.05 is the survey 25th percentile work RVU. The RUC also commented that this service is Modifier 51 exempt and assumed it may often be reported more than once, supporting pre- and post-service times of 0 minutes. **Therefore, the RUC recommends a work RVU of 0.05, no pre- or post-service time and five minutes of intra-service time for 95905.**

443

Practice Expense
The RUC reviewed the practice expense inputs and revised the clinical staff time to reflect that multiple units of services are typically reported.

PLI
The RUC recommends a PLI crosswalk to the key reference service, 76977-26 (the professional component only).

New Technology
The RUC recommends that 95905 is placed on the New Technology list.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
The following applies to nerve conduction tests (95900-95904): Codes 95900-95904 describe nerve conduction tests when performed with individually placed stimulating, recording, and ground electrodes. The stimulating, recording, and ground electrode placement and the test design must be individualized to the patient's unique anatomy. Nerves tested must be limited to the specific nerves and conduction studies needed for the particular clinical question being investigated. The stimulating electrode must be placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, and in some sensory and mixed nerve conduction studies, both proximal and distal stimulation will be used. Motor nerve conduction study recordings must be made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings must be made from electrodes placed directly over the specific nerve to be tested. Waveforms must be reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) must be adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Reports must be prepared on site by the examiner, and consist of the work product of the interpretation of numerous test results, using well-established techniques to assess the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of each nerve tested. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values, summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation. Code 95905 describes nerve conduction tests when performed with preconfigured electrodes customized to a specific anatomic site.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95905 Tracking Number M1 Specialty Society Recommended RVU: **0.15**

Global Period: XXX RUC Recommended RVU: **0.05**

CPT Descriptor: Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study; each limb, includes F-wave study when performed, with interpretation and report
(Report 95905 only once per limb studied)
(Do not report 95905 in conjunction with 95900-95904, 95934-95936)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42-year-old female data entry clerk reported that, although she had had no injuries and during the day she was okay, she had been awakened in the middle of each night for the past two weeks with a numb, aching, burning feeling in her right hand that was relieved by holding her hand down and shaking it, rubbing it and running cold water over it. Physical examination reveals weakness of right thumb abduction, wasting of the right thenar eminence, numbness of the palmar aspects of the right thumb, index finger and middle finger, and a Tinel's sign over the right median nerve at the carpal tunnel. (History and exam reported separately as E/M). Nerve conduction testing using preconfigured arrays for the right arm is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: The physician reviews a summary of electrodiagnostic data from each nerve tested and assesses it in the context of comparison to normal values and the patient's history and physical examination.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	1.81	2.19
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.48	1.95
Urgency of medical decision making	1.38	1.76

Technical Skill/Physical Effort (Mean)

Technical skill required	1.33	2.33
Physical effort required	1.19	1.76

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.24	1.71
Outcome depends on the skill and judgment of physician	1.67	2.29
Estimated risk of malpractice suit with poor outcome	2.10	1.86

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**

Time Segments (Mean)

Pre-Service intensity/complexity	1.24	1.48
Intra-Service intensity/complexity	1.19	1.90
Post-Service intensity/complexity	1.43	2.10

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The survey received 75 responses from among the 5 surveying societies.

Since the majority of respondents have not performed this service, the group also examined survey data based on only those who had performed the service in the last year. Based on that data, the median RVW was 0.17 and the times were 3 minutes pre-service, 5 minutes intra-service, and 5 minutes post-service. The results were very similar to the complete survey data.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) This procedure is typically reported on the same day as an E/M service.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Code		Global Period	RVW	Pre-time	Intra-time	Post-time	Total Time
9590X1	XXX	?	3	5	4	12	
99213	XXX	0.92	3	15	5	23	

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95900, 95903, 95904

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Family Physicians — How often? Sometimes

Specialty Endocrinology — How often? Sometimes

Specialty Neurology — How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 4000000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. We multiplied our estimates for Medicare times 4 to estimate national utilization.

Specialty Family Physicians — Frequency 2500000 — Percentage 62.50 %

Specialty Endocrinology — Frequency 1495000 — Percentage 37.37 %

Specialty Neurology — Frequency 5000 — Percentage 0.12 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,000,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We examined Medicare utilization data of 95900, 95903, and 95904 by family practice and internal medicine for 2006 and estimated most of the codes would have been reported for automated nerve testing services.

Specialty Family Physicians Frequency 625000 Percentage 62.50 %

Specialty Endocrinology Frequency 373750 Percentage 37.37 %

Specialty Neurology Frequency 1250 Percentage 0.12 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 76997

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor:

Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study; each limb, includes F-wave study when performed, with interpretation and report
(Report 95905 only once per limb studied)
(Do not report 95905 in conjunction with 95900-95904, 95934-95936)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The RUC advisors from the five specialty societies that surveyed the physician work involved with this code formed a joint RVS panel to formulate the recommendations regarding direct practice expense inputs. The joint RVS panel met twice by conference call and also exchanged information by e-mail. The panel members relied on their own experience and knowledge of the service to formulate the recommendations.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

RN/LPN/MA:

Intra-Service Clinical Labor Activities:

RN/LPN/MA: Reviews test orders and relevant clinical information. Files pre-authorization paperwork if necessary. Ensures adequate supply of electrodes for the ordered testing. Escorts patient from registration area to exam site and instructs patient on appropriate limb exposure, gowning if necessary. Explains testing procedure, purpose, and side effects. Positions patient for study, then cleans and preps indicated limb. Stimulating and recording surface electrode components of the nerve specific pre-configured electrode arrays are placed. Testing involves automated stimulation of nerves and recording of the waveforms of the resulting compound muscle or sensory nerve action potentials. The waveforms are transmitted electronically for computer generated analysis with respect to latency, amplitude, and configuration. Provides discharge instructions. Gathers data report and clinical information for interpretation by physician. Tracks and reorders electrode supplies as needed. Performs internal Q/A activity.

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Endoscopic Photodynamic Therapy Application

In February 2009, the CPT Editorial Panel edited two codes that initially described photodynamic therapy by endoscopic application of light (photodynamic therapy) in two specific anatomic regions, the lungs and esophagus. The procedure described endoscopic light application to a single region (esophagus) of the gastrointestinal tract. However, other areas of the gastrointestinal tract (e.g. oral cavity, biliary tract) are also frequently treated using endoscopic application of light. The CPT Editorial Panel deleted the word "esophagus" and replaced it with "gastrointestinal tract" to include areas of the gastrointestinal tract beyond the esophagus. Since the current RUC survey results for endoscopic photodynamic therapy were nine years old, interim, and were never validated by the RUC, the specialties performed a full RUC survey.

465

96570 ***Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); first 30 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and gastrointestinal tract)***
The RUC reviewed the specialty societies' survey data and agreed with the specialty that the survey results overestimated the physician time and work performed. The RUC and specialties agreed that the 25th percentile survey work value survey results was too high at 1.75 RVUs, however the RUC determined that the survey 25th percentile intra-service time of 30 minutes was appropriate for this service. After reviewing the survey results, the specialties could not provide compelling evidence to warrant an increase to the current work value of 1.10 RVUs.

The RUC compared the physician work required to perform 96570 to the following other add-on services: 31620 *Endobronchial ultrasound (EBUS) during bronchoscopic diagnostic or therapeutic intervention(s) (List separately in addition to code for primary procedure[s])*(Work RVU = 1.40), 31632 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with transbronchial lung biopsy(s), each additional lobe (List separately in addition to code for primary procedure)* (Work RVU = 1.03), 31637 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; each additional major bronchus stented (List separately in addition to code for primary procedure)* (Work RVU = 1.58), 13102 *Repair, complex, trunk; each additional 5 cm or less (List separately in addition to code for primary procedure)* (Work RVU = 1.24). Since this service is an add on to other endoscopy or bronchoscopy procedures of the lung and gastrointestinal tract, the specialty recommended, and the RUC agreed that the service has no pre- or post-service physician time.

After reviewing these services and the survey time, the RUC determined that the current work for this service is appropriate. **The RUC recommends a relative work value of 1.10 for CPT code 96570 with physician time of 30 minutes (intra-service), with zero minutes of pre- or post service time.**

96571 ***Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); each additional 15 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and gastrointestinal tract)***

The specialty survey results for 96571 consisted of 17 respondents which the specialty societies believed provided an overvaluation of physician work and time. All of the survey respondents included pre and post physician time in their responses for this add-on code. The specialties could not identify pre and post service work of the surveyed code to explain the survey times. In addition, the specialty could not explain a median response of 40 minutes intra-service time for a surveyed procedure which is defined as taking up to 15 minutes. The specialty society and the RUC concluded that the survey respondents either included pre and/or post time associated with the broncoscopy / endoscopy procedure that is performed with the surveyed code, or that the respondents did not understand the RUC survey process. The specialty society and the RUC concurred that the survey data was flawed and unusable. The specialties agreed to use a consensus panel approach which resulted in a physician work RVU recommendation of half the value of 96570, based on half the time (30 verses 15 minutes) as defined in the CPT descriptor. The RUC agreed with the specialty societies approach to value this service and reviewed the work of 96571 in relation to 97814 *Acupuncture, 1 or more needles; with electrical stimulation, each additional 15 minutes of personal one-on-one contact with the patient, with re-insertion of needle(s) (List separately in addition to code for primary procedure)* (Work RVU = 0.55, ZZZ global period, 15 minutes intra-service time). The RUC concurred that the physician work intensity and complexity of 96571 is identical to 96570 and requires half the time (15 intra-service minutes). **The RUC recommends a relative work value of 0.55 for CPT code 96571 with physician time of 15 minutes (intra-service), with zero minutes pre or post service time.**

Practice Expense: The RUC recommends no direct practice expense inputs for codes 96570 and 96571 in either the non-facility or facility settings.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲+96570	MM1	Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); first 30 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and ~~esophagus~~ gastrointestinal tract)	ZZZ	1.10 (No Change)
▲+96571	MM2	each additional 15 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and ~~esophagus~~ gastrointestinal tract) *(96570, 96571 are to be used in addition to bronchoscopy, endoscopy codes)* *(Use 96570, 96571 in conjunction with 31641, 43228 as appropriate)*	ZZZ	0.55 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:96570 Tracking Number MM1 Specialty Society Recommended RVU: **1.10**

Global Period: ZZZ RUC Recommended RVU: **1.10**

CPT Descriptor: Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); first 30 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and gastrointestinal tract)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 74-year-old male with a history of smoking and alcohol use complains of extreme difficulty with swallowing. Endoscopic examination is performed and reveals esophageal cancer. A computed tomography scan shows adjacent lymph node and celiac involvement. A determination is made that the patient is not a candidate for surgical resection. The patient receives radiation therapy and chemotherapy.

Subsequently, the patient develops recurrent complaints of dysphagia. Reassessment reveals that the tumor has progressed and is surgically non-resectable. Therapy of the patient's dysphagia using photodynamic therapy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 51%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform ar E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 88%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 75%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: N/A

Description of Intra-Service Work:
- Diffuser tip is inserted, the endoscopic laser light source is activated and applied to the tumor
- 2.5 minutes of endoscopic laser light using a 2.5 cm cylindrical diffusing fiberoptic endoscope are required for every 5 mm of tumor length
- During each application, the light source is periodically turned off so that the position of both the endoscope and the diffuser may be checked
- At the completion of the procedure, the light application is turned off and the endoscope with the diffuser tip is withdrawn

Description of Post-Service Work: N/A

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Chest Physicians (ACCP), American Gastroenterological Association (AGA), American ociety for Gastrointestinal Endoscopy (ASGE), American Thoracic Society (ATS), and The Society of Thoracic urgeons (STS)/American Association for Thoracic Surgery (AATS) conducted a survey of code +96570, Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); first 30 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and gastrointestinal tract). The parenthetical for code 96570 was revised at the February 2009 CPT Editorial Panel meeting to include areas of the gastrointestinal tract beyond the esophagus. Although the societies considered the

revision accepted during the CPT Editorial Panel meeting to be editorial, as the previously accepted physician work values were considered interim, the RUC requested the societies to survey the code.

After reviewing the survey data, the societies recommend maintaining the current work value of 1.10 WRVUs. The societies recommend 30 minutes of physician intra-service time and no pre and post time. The recommended WRVU is less than the 25th percentile value from the survey.

Survey Process

The survey was electronically disseminated to 114 practicing gastroenterologists, pulmonologists, and thoracic surgeons. A total of 27 responses (23.6% response rate) were received.

Survey Data

The societies convened an expert panel to review the survey data for code +96570.

+96570 Survey Data

High	120	90	120	60	
Post Time					
Median	20	35	20	20	120

An expert panel comprised of representatives from the Pulmonary, Gastroenterology, and Thoracic Surgery societies was convened to review the survey data. The panel had significant concerns with the survey data. Although a ZZZ code typically has only intra-service physician time associated with it, all of the survey respondents included pre and post physician time in their responses. The panel could not identify pre and/or post service work of the surveyed code to explain the survey times. In addition, the panel could not explain a median response of 45 minutes intra-service time for a surveyed procedure which was defined as taking up to 30 minutes. The panel concluded that the survey respondents either included pre- and/or post- time associated with the bronchoscopy / endoscopy procedure that is performed with the surveyed code, or that the respondents did not understand the RUC survey process.

After considering numerous options, the panel was unable to accurately link time and RVUs from the survey data. The panel concluded that the survey data was flawed and unusable. ***A consensus was reached to dismiss the data and develop work and physician time recommendations based on a consensus panel approach.***

A Note on the Moderate Sedation Survey Question

Moderate sedation is NOT inherent to the PDT. Rather, it is inherent to the base procedure (esophagoscopy, bronchoscopy). The panel of experts concluded that a high number of survey respondents indicated that it was inherent to +96570 due to confusion on the part of survey respondents.

Work and Physician Time Recommendation Development – Consensus Panel Approach

Time Recommendation Development

Code +96570 is a ZZZ code that is always performed with either an endoscopy or bronchoscopy procedure. The endoscopy or bronchoscopy is performed in order for the physician to gain access for the photodynamic therapy. The code descriptor defines up to 30 minutes of treatment. The Panel agreed that there was no pre or post service work

unique to the photodynamic therapy (PDT) that was not associated with the separately billed endoscopy / bronchoscopy procedure.

Based on these factors the panel concluded that 30 minutes of intra-service physician time was an appropriate recommendation.

Work Recommendation Development

Comparison to Codes on Reference Service List

The panel reviewed work and time data for codes on the reference service list (RSL). The RSL represents services familiar to the survey respondents and, to an extent, reflects a spectrum of the ZZZ global services provided by the three specialties.

The Panel considered 3 codes in particular:

- 31620, Endobronchial ultrasound (EBUS) during bronchoscopic diagnostic or therapeutic intervention(s) (List separately in addition to code for primary procedure[s])
- 31632, Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with transbronchial lung biopsy(s), each additional lobe (List separately in addition to code for primary procedure)
- 31637, Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; each additional major bronchus stented (List separately in addition to code for primary procedure)

Code 31620 was the most common code chosen from the reference list when data from all of the specialties, pulmonology-only, and gastroenterology-only survey responders was analyzed.

Code	Global	Data Source	WRVU	Pre Time	Intra Time	Post Time	IWPUT
31620	ZZZ	RUC	1.40	0	20	0	0.070
31632	ZZZ	RUC	1.03	0	18	0	0.057
31637	ZZZ	RUC	1.58	0	30	0	0.053

The Panel could not identify a compelling reason to change the current WRVU value of 1.10. With a WRVU of 1.10 and 30 minutes of intra-service time the code +96570 has an IWPUT of 0.037 which is significantly lower than the similar services on the reference service list and other commonly performed services provided by the three specialties.

The panel agreed that the current value of 1.10 fell appropriately within the range of these other services:

- +31637 – While both +96570 and +31637 are 30 minute procedures, the panel agreed that +96570 is a slightly less intense procedure and a lower WRVU value was appropriate
- +31632 – The panel concluded that the longer intra-service time for +96570 justified the slightly higher recommended value for the code
- +31620 – While code +31620 has less time and a higher WRVU than is being recommended for code +96570, the panel concluded that this was appropriate due to the greater intensity of code +31620.

Comparison to Other ZZZ Codes

The societies also looked at ZZZ codes outside of the families of codes performed by the specialties who surveyed this code and identified several codes with 30 minute of intra time which support the recommended value. Virtually all of the identified codes have RVWs well in excess of 1.10. We will cite just two for comparison purposes. Code 99355, Prolonged physician service in the office or other outpatient setting requiring direct (face-to-face) patient contact beyond the usual service; each additional 30 minutes (List separately in addition to code for prolonged physician service) is assigned an RVW of 1.77 for 30 minutes of intra time only. Code 95975, Electronic analysis of implanted neurostimulator pulse generator system (e.g., rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex cranial nerve neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, each additional 30 minutes after first hour (List separately in addition to code for primary procedure) is assigned an RVW of 1.70 for 30 minutes of intra time only.

On the MPC list, Code 13102 (Repair, complex, trunk; each additional 5 cm or less) a ZZZ Code with 25 minutes intra-service and total time has a WRVU of 1.24. Code 13133 (Repair, complex, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; each additional 5 cm or less) a ZZZ Code with 30 minutes intra-service and total time has a WRVU of 2.19.

In summary, we could not identify a compelling reason to change the current work RVW of 1.10 and consider the recommended RVW comparable to the values for other bronchoscopy codes with ZZZ global periods and to other ZZZ codes not typically performed by the surveyed specialties. In addition, the IWPUT of 0.037 is substantially less than the IWPUT assigned to high volume E/M codes including office visits for established patients.

In view of the above, the societies recommend 1.10 WRVUs and physician time of 30 minutes (intra-service), with zero minutes of pre- or post-service time, for code +96570.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. SCENARIO A - Reported with code 31641, Bronchoscopy (rigid or flexible); with destruction of tumor or relief of stenosis by any method other than excision (eg, laser therapy, cryotherapy)

3. CODE #	GLOBAL	WRVU	TIME SOURCE	PRE TIME	INTRA TIME	POST TIME
4. 31641	000	5.02	HARVARD	48	70	23

5.

6. SCENARIO B - Reported with code 43228, Esophagoscopy, rigid or flexible; with ablation of tumor(s), polyp(s), or other lesion(s), not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique

7. CODE #	GLOBAL	WRVU	TIME SOURCE	PRE TIME	INTRA TIME	POST TIME
8. 43228	000	3.76	HARVARD	45	40	23

9.

10. SCENARIO C – Reported with code 43258, Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with ablation of tumor(s), polyp(s), or other lesion(s) not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique

11. CODE #	GLOBAL	WRVU	TIME SOURCE	PRE TIME	INTRA TIME	POST TIME
12. 43258	000	4.54	RUC	21	46	20

13.

14. SCENARIO D – Reported with code 43272, Endoscopic retrograde cholangiopancreatography (ERCP); with ablation of tumor(s), polyp(s), or other lesion(s) not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique

15. CODE #	GLOBAL	WRVU	TIME SOURCE	PRE TIME	INTRA TIME	POST TIME
16. 43272	000	7.38	RUC	25	60	20

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) +96570, Photodynamic therapy by endoscopic application of light to ablate abnormal tissue vi activation of photosensitive drug(s); first 30 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and esophagus)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty Pulmonology How often? Rarely

Specialty Thoracic Surgery How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 1035
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on data received from the National Council for Prescription Drug Programs (NCPDP)

Specialty Thoracic Surgery Frequency 424 Percentage 40.96 %

Specialty Gastroenterology Frequency 353 Percentage 34.10 %

Specialty Pulmonology Frequency 103 Percentage 9.95 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 413
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2007 Medicare utilization data

Specialty Thoracic surgery Frequency 169 Percentage 40.92 %

Specialty Gastroenterology Frequency 141 Percentage 34.14 %

Specialty Pulmonology Frequency 41 Percentage 9.92 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. Current code 96570

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:96571 Tracking Number MM2 Specialty Society Recommended RVU: **0.55**

Global Period: ZZZ RUC Recommended RVU: **0.55**

CPT Descriptor: Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); each additional 15 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and gastrointestinal tract)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: In the same session additional therapy of the patient's dysphagia using photodynamic therapy is performed for the patient described below.

A 74-year-old male with a history of smoking and alcohol use complains of extreme difficulty with swallowing. Endoscopic examination is performed and reveals esophageal cancer. A computed tomography scan shows adjacent lymph node and celiac involvement. A determination is made that the patient is not a candidate for surgical resection. The patient receives radiation therapy and chemotherapy.

Subsequently, the patient develops recurrent complaints of dysphagia. Reassessment reveals that the tumor has progressed and is surgically non-resectable. Therapy of the patient's dysphagia using photodynamic therapy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 58%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 94%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 76%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Because of the size of the tumor, the treatment session lasts an additional 15 minutes beyond the initial 30 minutes assigned to Code 96570.

- 2.5 minutes of endoscopic laser light using a 2.5 cm cylindrical diffusing fiberoptic endoscope are required for every 5 mm of tumor length
- During each application, the light source is periodically turned off so that the position of both the endoscope and the diffuser may be checked
- At the completion of the procedure, the light application is turned off and the endoscope with the diffuser tip is withdrawn

Description of Post-Service Work: N/A

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American College of Chest Physicians (ACCP), American Gastroenterological Association (AGA), American Society for Gastrointestinal Endoscopy (ASGE), American Thoracic Society (ATS), and The Society of Thoracic Surgeons (STS)/American Association for Thoracic Surgery (AATS) conducted a survey of code +96571, Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); each additional 15 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and gastrointestinal tract). This parenthetical for code 96571

was revised at the February 2009 CPT Editorial Panel meeting to include areas of the gastrointestinal tract beyond the esophagus. Although the societies considered the revision accepted during the CPT Editorial Panel meeting to be editorial, as the previously accepted physician work values were considered interim, the RUC requested the societies to survey the code.

Based on a consensus panel process the societies recommend maintaining the existing WRVU value of 0.55. The societies recommend 15 minutes of physician intra-service time. The recommended value is less than the 25th percentile value from the survey data.

Survey Process
The survey was electronically disseminated to 114 practicing gastroenterologists, pulmonologists, and thoracic surgeons. A total of 17 responses (14.9% response rate) were received.

Work and Physician Time Recommendation Development – Consensus Panel Approach
Code +96570 was surveyed at the same time as +96571. An expert panel comprised of representatives from the Pulmonary, Gastroenterology, and Thoracic Surgery societies was convened to review the survey data. The panel had significant concerns with the survey data. Although a ZZZ code typically has only intra-service physician time associated with it, all of the survey respondents included pre and post physician time in their responses. The panel could not identify pre and/or post service work of the surveyed code to explain the survey times. In addition, the panel could not explain a median response of 40 minutes intra-service time for a surveyed procedure which was defined as taking up to 15 minutes. The panel concluded that the survey respondents either included pre- and/or post- time associated with the bronchoscopy / endoscopy procedure that is performed with the surveyed code, or that the respondents did not understand the RUC survey process.

After considering numerous options, the panel was unable to accurately link time and RVUs from the survey data. The panel concluded that the survey data was flawed and unusable. ***A consensus was reached to dismiss the data and develop work and physician time recommendations based on a consensus panel approach.***

A Note on the Moderate Sedation Survey Question
Moderate sedation is NOT inherent to the PDT. Rather, it is inherent to the base procedure (esophagoscopy, bronchoscopy). The panel of experts concluded that a high number of survey respondents indicated that it was inherent to +96571 due to confusion on the part of survey respondents.

Time Recommendation Development
Code +96570 is a ZZZ code that is performed with an endoscopy or bronchoscopy procedure. The endoscopy or bronchoscopy is performed in order for the physician to gain access for the photodynamic therapy. Code +96571 describes the continuation of the services described by code +96570. Code +96570 represents the first 30 minutes of the photodynamic therapy (PDT) service and code +96571 represents each additional 15 minutes of the PDT service. The expert panel agreed that there was no pre or post service work unique to the PDT that was not associated with the separately billed endoscopy / bronchoscopy procedure.

Based on these factors the panel concluded that 15 minutes of intra-service physician time was an appropriate and reasonable recommendation for code +96571.

Work Recommendation Development
Lacking usable survey data for code +96570, the expert panel had established a WRVU value of 1.10 using a crosswalk methodology. Code +96570 describes 30 minutes of photodynamic therapy and code +96571 is a continuation of this service representing each additional 15 minutes of treatment. Since +96571 represents 50% of the treatment time of +96570, the panel recommended that a fair and reasonable approach in determining a WRVU value for +96571 would be to recommend 50% of the WRVU value that was established for code +96570. This results in a value of 0.55 WRVU for code +96571. The Panel could not identify a compelling reason to change the current WRVU value of 0.55 for code +96571.

In view of the above, the societies recommend 0.55 WRVUs and physician time of 15 minutes (intra-service), with zero minutes of pre- or post-service time, for code +96571.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. SCENARIO A - Reported with code 31641, Bronchoscopy (rigid or flexible); with destruction of tumor or relief of stenosis by any method other than excision (eg, laser therapy, cryotherapy) AND +96570, Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); first 30 minute

	CODE #	GLOBAL	WRVU	TIME SOURCE	PRE TIME	INTRA TIME	POST TIME
3.							
4.	31641	000	5.02	HARVARD	48	70	23
5.	+96570	ZZZ	1.10	RUC	0	50	0
6.							

7. SCENARIO B - Reported with code 43228, Esophagoscopy, rigid or flexible; with ablation of tumor(s), polyp(s), or other lesion(s), not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique AND +96570, Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); first 30 minute

	CODE #	GLOBAL	WRVU	TIME SOURCE	PRE TIME	INTRA TIME	POST TIME

20.	+96570	ZZZ	1.10	RUC	0	50	0

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) +96571, Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); each additional 15 minutes (List separately in addition to code for endoscopy bronchoscopy procedures of lung and esophagus)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty Pulmonology How often? Rarely

Specialty Thoracic Surgery How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 55
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on data received from the National Council for Prescription Drug Programs (NCPDP)

Specialty Thoracic surgery Frequency 5 Percentage 9.09 %

Specialty Gastroenterology Frequency 23 Percentage 41.81 %

Specialty Pulmonology Frequency 25 Percentage 45.45 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 22
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2007 Medicare utilization data

Specialty Thoracic surgery Frequency 2 Percentage 9.09 %

Specialty Gastroenterology Frequency 9 Percentage 40.90 %

Specialty Pulmonology Frequency 10 Percentage 45.45 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 96571

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

April 2009

Remote Diabetic Retinopathy Imaging

The American Academy of Ophthalmology (AAO) requested that code 9917X *Remote retinal imaging with interpretation and report (eg, diabetic retinopathy), bilateral*, which was recently approved by the CPT Editorial Panel in February 2009, be rescinded at this time. The AAO indicated that after surveying this code to develop a relative work value, they found that the respondents identified two distinct levels in this developing service. The specialty society requests to go back to the CPT Editorial Panel with a new coding proposal separating this service into two codes in order to identify the two approaches to remote retinal imaging. **The RUC recommends that CPT rescind code 9917X and the specialty society will develop a new coding proposal. Note: The CPT Executive Committee rescinded 9917X at its May 2009 Meeting.**

489

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
•9917X	NN1	Remote retinal imaging with interpretation and report (eg, diabetic retinopathy), bilateral (Do not report 9917X in conjunction with 92135 or 92250. This service may not be used in addition to a general ophthalmological service, 92002-92014 or with the evaluation and management of the visual system, 99201-99350)	XXX	Recommend CPT rescind this code and specialty society will develop a new coding proposal
92135		Scanning computerized ophthalmic diagnostic imaging, posterior segment, (eg, scanning laser) with interpretation and report, unilateral (For remote retinal imaging, use 9917X)	XXX	0.35 (No Change)
92250		Fundus photography with interpretation and report (For remote retinal imaging, use 9917X)	XXX	0.44 (No Change)

Ms. Sherry Smith
Director, AMA RUC
American Medical Association
515 North State Stree
Chicago, IL 60610

Dear Ms.Smith:

The American Academy of Ophthalmology (the Academy) is writing to request that the code that was recently approved by the CPT Editorial Panel at its February 2009 Panel meeting, ***9917X*** *Remote retinal imaging with interpretation and results*, be withdrawn at this time, for submission of a recommended work value at the April 2009 RUC meeting. In surveying this code to develop a relative work value, the Academy has found that the respondents identified two distinct levels of service in this developing model of care.

We would like to bring a revised application back to the Panel that would correctly identify these two approaches to remote imaging. We expect to work on this with the American Optometric Association and other related organizations in preparation for a revised submission to the AMA CPT Editorial Panel this fall.

Thank you for your consideration.

Sincerely,

Steve Kamenetzky

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

October 2008

Prolonged Services Revision

The RUC considered code descriptor modification to CPT codes 99358 and 99359, which describe non face-to-face prolonged services. The RUC agreed with the specialty societies that the June 2008 revisions made by the CPT Editorial Panel to these codes reflect an editorial change in the description of the services and do not represent a change in the physician work involved in furnishing them. These codes are used to describe non face-to-face time that is provided beyond that listed in the CPT book as the typical time for an E/M service code. CPT 99358 is used to describe the first hour of such service and CPT 99359 is used to describe each additional 30 minutes. The CPT Editorial Panel change specifies that the non-face-to-face time need not be provided on the same date as the initial E/M service, but must be provided on a single date (i.e. not added up over many days). The work itself is not changed, merely the date on which it is provided. A change in global period would typically require a RUC survey, however, in this case a change from a ZZZ global code to an XXX global code without any pre- or post- time does not appear to necessitate a survey. Without a change in time or a change in work, these are the same services described in the current codes. **In summary, the RUC agreed that this change be considered editorial and does not require a survey. However, the RUC recommends that the vignette for these services be changed to reflect the current service:**

An 85-year-old new patient with multiple complicated medical problems has moved to the area to live closer to her daughter. She is brought to the primary care office by her daughter and has been seen and examined by the physician. The physician indicated that past medical records would be obtained from the patient's prior physicians' and that he will communicate further with the daughter upon review of them.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from the Five Year Review

April 2009

Adjacent Tissue Transfer

CPT code 14300 *Adjacent tissue transfer or rearrangement, more than 30 sq cm, unusual or complicated, any area* was identified by the Five Year Review Identification Workgroup as potentially misvalued through its site of service anomaly screen in September 2007. The Workgroup reviewed all services that include inpatient hospital visits within their global periods, but are performed less than 50% of the time in the inpatient setting, according to recent Medicare utilization data. The RUC originally recommended a two-step action. First, the RUC removed the hospital visits from the service with no impact on the associated work RVU. Second, the RUC recommended that services be surveyed. Subsequent to being identified through the site of service anomaly screen, this code was identified through the CMS Fastest Growing Procedures Screen. The specialty societies agreed that the descriptor for this code did not accurately describe the work that is involved in the service as it did not differentiate between large and small defects therefore, the specialty society requested and the RUC agreed that the service be referred to CPT to clarify this issue. To address this concern the CPT Editorial Panel deleted CPT code 14300 and established two new codes to report adjacent tissue transfer of small and large defects.

495

14301 ***Adjacent tissue transfer or rearrangement, any area; defect 30.1 sq cm to 60 sq cm***

The RUC reviewed the survey times for 14301 and questioned the additional 7 minutes of time added to the pre-service time package selected. The specialty societies explained that they added additional positioning time because these defects are occurring more frequently on difficult parts of the body including the face and hand and therefore the physician requires more time to position the particular body part to gain appropriate access to the surgical site. Based on this rationale, the RUC agreed that the additional positioning time associated with this service best reflected the pre-service time for this procedure. The RUC compared the surveyed code to its reference code 14060 *Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less* (Work RVU=9.07). The RUC noted that the surveyed code has more intra-service time as compared to the reference code, 100 minutes and 60 minutes respectively. Further, the RUC compared the surveyed code to another reference code MPC Code 58720 *Salpingo-oophorectomy, complete or partial, unilateral or bilateral (separate procedure)* (Work RVU=12.08). The RUC noted that the surveyed code has slightly more time than this reference code, 100 minutes and 90 minutes respectively. Further, the RUC compared the intensity complexity measurements of the surveyed code and the reference code and determined that the surveyed code

requires more mental effort and judgment, more technical skill and physical effort to perform than the reference code. After making these comparisons, the specialty society explained that they did not have any compelling evidence to validate a higher work RVU for this service and therefore agreed that the impact of this code and 14302 need to be work neutral. Therefore based on utilization assumptions presented in the table below, the RUC agreed with the specialty societies recommended value of 12.47 work RVUs which is a value between the 25th percentile and the median. **The RUC recommends 12.47 Work RVUs for 14301.**

14302 ***Adjacent tissue transfer or rearrangement, any area; each additional 30 sq cm, or part thereof***

The RUC compared the surveyed code to its reference code 49568 *Implantation of mesh or other prosthesis for open incisional or ventral hernia repair or mesh for closure of debridement for necrotizing soft tissue infection (List separately in addition to code for the incisional or ventral hernia repair)* (Work RVU=4.88). The RUC noted that the surveyed code has less intra-service time as compared to the reference code, 40 minutes and 52 minutes respectively. Further, the RUC compared the intensity complexity measurements of the surveyed code and the reference code and determined that the reference code requires more mental effort and judgment and more physical effort to perform than the surveyed code. After making these comparisons, the specialty society explained that they did not have any compelling evidence to validate a higher work RVU for this service and therefore agreed that the impact of this code and 14302 need to be work neutral. Therefore based on utilization assumptions presented in the table below, the RUC agreed with the specialty societies recommended value of 3.73 work RVUs, the survey median. **The RUC recommends 3.73 Work RVUs for 14302. The RUC requested that this code be reviewed in the future to review the volume of this service to ensure that the utilization assumptions were accurate. Therefore the RUC added the code to the New Technology List solely to review claims data to ensure only 15% of these services are reported with the add-on code.**

4996

Work Neutrality Table

	RVW	Percentage	Utilization	Total RVUs
Current Data				
14300	13.26		14,138	**187,470 (Current RVUs)**
Projected Data				
14301 (100% of current utilization for 30-60 sq cm defects)	**12.47**	100.00%	14,138	176396
14302*1 (10% will be 60-90 sq cm defects)	**3.73**	10.00%	1,414	5273
14302*2 (4% will be 90-120 sq cm defects – requiring 14302 reported twice in addition to the base code)	7.46	4.00%	566	4219
14302*3 (1% will be 120-150 sq cm defects – requiring 14302 reported thrice in addition to the base code)	11.19	1.00%	141	1582
				187,470 (Projected RVUs)

PLI Crosswalks:
The RUC recommended that 14301 be crosswalked to the existing PLI of 14300 as they agree this is the most appropriate crosswalk.

Practice Expense:
The RUC reviewed the specialty societies' practice expense inputs for these services and with the exception of the addition of a medical supply recommend the proposed practice expense inputs which include practice expense inputs in the facility and non-facility setting for 14301 and no practice expense inputs for 14302 as it is typically performed in the facility setting.

CPT Code (•New)	Tracking Number	CPT Descriptor	Work RVU Recommendation
For full thickness repair of lip or eyelid, see respective anatomical subsections. Codes 14000~~-14300~~ 14302 are used for excision (including lesion) and/or repair by adjacent tissue transfer or rearrangement (eg, Z-plasty, W-plasty, V-Y plasty rotation flap, advancement flap~~, double pedicle flap~~). When applied in repairing lacerations, the procedures listed must be performed by the surgeon to accomplish the repair. They do not apply to direct closure or rearrangement of traumatic wounds incidentally resulting in these configurations. Undermining alone of adjacent tissues to achieve closure, without additional incisions, does not constitute adjacent tissue transfer, see complex repair- 13100- ~~13153,~~13160. The excision of a benign lesion (11400-11446) or a malignant lesion (11600-11646) is not separately reportable with codes 14000~~-14300~~ 14302.			
D 14300		~~Adjacent tissue transfer or rearrangement, more than 30 sq cm, unusual or complicated, any area~~	N/A
•14301	R1	Adjacent tissue transfer or rearrangement, any area; defect 30.1 sq cm to 60 sq cm	12.47
•+14302	R2	each additional 30 sq cm, or part thereof (List separately in addition to code for primary procedure) (Use 14302 in conjunction with 14301) (14300 has been deleted. To report, use 14301, 14302)	3.73

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:14301 Tracking Number R1 Specialty Society Recommended RVU: **12.47**

Global Period: 090 RUC Recommended RVU: **12.47**

CPT Descriptor: Adjacent tissue transfer or rearrangement, any area; defect 30.1 sq cm to 60 sq cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 63 year old female with an excised basal cell carcinoma on the left medial cheek leaves a defect through the subcutaneous plane that is 9.0 sq cm. A cheek rotation flap that is 42.0 sq cm is raised adjacent to the defect. The flap is transposed into the defect to achieve closure. The donor site is closed primarily.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Percent of survey respondents who stated they perform the procedure; In the hospital 52% , In the ASC 3%, In the office 44%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 38% , Kept overnight (less than 24 hours) 44% , Admitted (more than 24 hours) 19%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 71%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 25%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Determine indication for intra-operative antibiotics and prescribe as necessary. Review preadmission work-up, with particular attention to imaging information and reports. Reexamine patient to make sure that physical findings have not changed, and update H&P. Review results of preadmission testing (lab, EKG, chest x-ray, availability of blood products). Meet with patient and family to review planned procedure and post-operative management. Review and obtain informed consent, including witness. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Monitor/assist with positioning of patient. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: The lesion is excised and then oriented and marked with sutures for pathologic examination. Hemostasis is obtained. Care is taken to determine the availability of adjacent tissue for closure and the possibility of functional impairment or anatomic distortion of adjacent structures. A flap is designed on the adjacent cheek skin. The flap is incised and raised at the appropriate level. The flap is rotated into the defect. Tension is assessed and additional dissection performed as necessary. The donor site is closed in layers. Drains are placed necessary. The flap is sutured into position.

Description of Post-Service Work:
Facility: A sterile dressing is applied. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note. Monitor patient stabilization in the recovery room. After patient is

awake, discuss surgery outcome with patient. Examine patient to assess for the development of complications (eg, bleeding). Dictate operative report (copy PCP and/or referring physician) and complete medical record documentation. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions, especially activity, bathing. Reconcile medications and write orders for post-discharge medication. Complete all appropriate medical records, including discharge summary and discharge instructions, and insurance forms.

Office: Examine and talk with patient. At several office visits, dressings will be removed and the wound will be assessed for flap compromise or compromise of structures adjacent to the flap (eg, eyes). The wound will be redressed. Drain(s) and sutures are removed, when appropriate. Pathology report is discussed when available. Write prescription orders, as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.69	2.94
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.94	2.31
Urgency of medical decision making	2.50	2.00

Technical Skill/Physical Effort (Mean)

Technical skill required	3.69	3.19
Physical effort required	2.94	2.44

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.63	3.00
Outcome depends on the skill and judgment of physician	3.75	3.38
Estimated risk of malpractice suit with poor outcome	2.69	2.56

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.31	2.50
Intra-Service intensity/complexity	3.81	3.00
Post-Service intensity/complexity	2.81	2.31

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The adjacent tissue transfer (ATT) family of codes were identified by the RUC 5YR ID Workgroup as having a site of service anomaly. The descriptor for 14300 was identified as not accurately describing the work that is involved in this service. Additionally, ASPS noted that the 14300 descriptor includes multiple regions of the body, thus the individual circumstances can vary with respect to site of service.

A survey of plastic surgeons, dermatologists, otolaryngologists, and general surgeons was conducted for 14301. A consensus committee of specialists from these four disciplines reviewed the survey data.

With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: No change from standard 33 minutes.
- Positioning: Many different positions are possible for 143X1. Given the variability in positioning, we are recommending an additional 7 minutes for a total of 10 minutes, recognizing that this may not capture the time for all possible positioning.
- Scrub/Dress/Wait: No change from standard 15 minutes.

We agree with the median response that this patient would be discharged on the same day as the procedure. Consistent with the survey data, we recommend 4 post-office visits at the following levels:

- 99213 – Evaluation for flap compromise or compromise of structures adjacent to the flap (e.g., eyes)
- 99213 – Removal of drains; check viability of flap (e.g., arterial flow); wound assessment
- 99213 – Removal of sutures and explanation of pathology report
- 99212 – Check flap viability and wound healing

Code 14300 was split into two codes 143X1 and 143X2. Without compelling evidence, the recommendations need to be work neutral. The consensus committee discussed how often 143X2 would be used in multiples of 1, 2, or 3 and agreed with estimates of 10%, 4% and 1% respectively. This would account for ATT up to 150 sq cm. After that size, it was agreed that anything larger would most likely require another type of closure. Additionally, **the consensus committee agreed with the median survey RVW of 3.73 for 143X2,** as appropriately reflecting the more complex work of the larger ATT. Using the percentage 143X2 estimates, the recommended RVW for 143X2, and the current Medicare utilization for 14300, **we arrive at a work-neutral recommendation of 12.70 work RVUs for 143X1,** as presented in the table below:

CPT			2007 Util	RVW	Work RVUs
14300	Current RVW and Util		14,138	13.26	187,470

CPT	*Estimated* Utilization		Est Util	Rec RVW	Work RVUs
143X1	100% of current util for 30-60 sq cm	100%	14,138	12.70	179,553
143X2	10% will be 60-90 sq cm	10%	1,414	3.73	5,273
143X2	4% will be 90-120 sq cm	4%	566	3.73	2,109
143X2	1% will be120-150 sq cm	1%	141	3.73	527
					187,463

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 14300

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology How often? Commonly

Specialty Plastic Surgery How often? Commonly

Specialty General Surgery/Otolaryngology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency unknown.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 14,138 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Untilization for 143X1 will be 100% of the current utilization for 14300 per 2007 Medicare data.

Specialty Dermatology Frequency 6221 Percentage 44.00 %

Specialty Plastic Surgery Frequency 4684 Percentage 33.13 %

Specialty General Surgery/Otolaryngology Frequency 2581 Percentage 18.25 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 14300 is currently used to bill this procedure and is the most appropriate crosswalk

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)

The number of possible diagnosis and/or the number of management options that must be considered	3.67	2.83
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.00	3.17
Urgency of medical decision making	3.33	2.67

Technical Skill/Physical Effort (Mean)

Technical skill required	4.33	3.50
Physical effort required	3.50	3.67

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	3.33	3.17
Outcome depends on the skill and judgment of physician	4.50	3.83
Estimated risk of malpractice suit with poor outcome	3.33	3.00

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1

Time Segments (Mean)

Pre-Service intensity/complexity	2.83	2.83
Intra-Service intensity/complexity	4.00	3.50
Post-Service intensity/complexity	2.50	3.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The adjacent tissue transfer (ATT) family of codes were identified by the RUC 5YR ID Workgroup as having a site of service anomaly. The descriptor for 14300 was identified as not accurately describing the work that is involved in this service. Additionally, ASPS noted that the 14300 descriptor includes multiple regions of the body, thus the individual circumstances can vary with respect to site of service.

Code 14300 was split into two codes 143X1 and 143X2. Without compelling evidence, the recommendations need to be work neutral. The consensus committee discussed how often 143X2 would be used in multiples of 1, 2, or 3 and agreed with estimates of 10%, 4% and 1% respectively. This would account for ATT up to 150 sq cm. After that size, it was agreed that anything larger would most likely require another type of closure. Additionally, **the consensus committee agreed with the median survey RVW of 3.73 for 143X2,** as appropriately reflecting the more complex work of the larger ATT. Using the percentage 143X2 estimates, the recommended RVW for 14302, and the current Medicare utilization for 14300, we arrive at a work-neutral recommendation of 12.70 work RVUs for 14301, as presented in the table below:

CPT			2007 Util	RVW	Work RVUs
14300	Current RVW and Util		14,138	13.26	187,470

CPT	*Estimated* Utilization		Est Util	Rec RVW	Work RVUs
143X1	100% of current util for 30-60 sq cm	100%	14,138	12.70	179,553
143X2	10% will be 60-90 sq cm	10%	1,414	3.73	5,273
143X2	4% will be 90-120 sq cm	4%	566	3.73	2,109
143X2	1% will be120-150 sq cm	1%	141	3.73	527
					187,463

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 14300

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Plastic Surgery How often? Sometimes

Specialty General Surgery How often? Sometimes

Specialty Otolaryngology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency unknown

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
2,121 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate that 15% of cases currently billable as 14300 will now be billed as 143X2.

Specialty Plastic Surgery	Frequency 1273	Percentage 60.01 %
Specialty General Surgery	Frequency 425	Percentage 20.03 %
Specialty Otolaryngology	Frequency 319	Percentage 15.04 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
010 or 090 Day Global Periods
Facility Direct Inputs

CPT Long Descriptor:

CPT	DESCRIPTION	GLOB
14301	**Adjacent tissue transfer or rearrangement, any area; defect 30.1 sq cm to 60 sq cm**	090

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The facility practice expense details were discussed by a consensus committee of plastic surgeons, dermatologists, otolaryngologists, and general surgeons representing a variety of practice types and geographic settings.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff completes pre-service diagnostic and referral forms. They call the hospital to schedule space and equipment needed in the facility and coordinate with the facility, the patient and other offices as necessary to prepare for the procedure. Clinical staff will provide and review educational materials and information prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carried out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure.

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities:

Discharge management (standard 6 minutes for same day) and standard office visit related activities are performed.

CPT Long Descriptor:

CPT	DESCRIPTION	GLOB
14301	Adjacent tissue transfer or rearrangement, any area; defect 30.1 sq cm to 60 sq cm	090

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The direct non-facility practice expense details were discussed by a consensus committee of plastic surgeons, dermatologists, otolaryngologists, and general surgeons representing a variety of practice types and geographic settings.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff completes pre-service diagnostic and referral forms. Clinical staff will provide and review educational materials and information prior to the procedure. Clinical staff will also call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carried out. Calls may also be necessary to coordinate changes in polypharmacy prior to the procedure.

Intra-Service Clinical Labor Activities:

Clincal staff reviews the chart to be certain all pre-procedure testing and images are available and the H&P is current. The patient will be greeted and gowned and vital signs obtained. The procedure is reviewed. The procedure room is prepared, making certain supplies and equipment necessary are available. Clinical staff assists the physician with prepping, positioning, and providing anesthesia. This is a sterile procedure therefore, once the clinical staff is gloved, they will remain in the room and assist the physician with the entire procedure. After completion of the procedure, clinical staff will monitor the patient; clean the room; clean the surgical instruments; prepare diagnostic forms and send the excised specimen to pathology (if applicable); check dressings; and provide instructions on wound care, follow-up visits, and prescriptions.

Post-Service Clinical Labor Activities:
Standard office visit related activities are performed.

Details regarding medical supplies and equipment are provided in the attached spreadsheet.

RUC Recommendations for CPT 2010 Volume II

RUC Meetings October 2008, February 2009 and April 2009

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
RUC RECOMMENDATIONS FOR CPT 2010

TABLE OF CONTENTS

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

Originated from Five Year Review

February 2009

Excision of Soft Tissue and Bone Tumors

Background:
The American Academy of Orthopaedic Surgery (AAOS) and the Musculoskeletal Tumor Society (MSTS) responded to the Centers for Medicare and Medicaid Services' (CMS) Five-Year Review request for comment on misvalued codes in 1995, arguing that the Hsaio survey had misvalued these services. During the course of this first Five-Year Review process, it became evident that coding changes would be necessary prior to revaluing these services. From 1995-2005, MSTS and AAOS drafted CPT proposals to address issues within the soft tissue tumor excision family and bone tumor family codes but these proposals were rejected by the CPT advisors and/or the CPT Editorial Panel. For the 2005 Five-Year Review, MSTS and AAOS submitted 14 soft tissue tumor codes and 12 bone tumor codes which were ultimately referred again to the CPT Editorial Panel for clarification and creation of new codes to differentiate the codes based on the size and depth of the tumor. In February 2009, the CPT Editorial Panel approved the coding proposal submitted by the Soft Tissue Tumor and Bone Workgroup which revised and expanded the soft tissue tumor and bone tumor sections to more accurately describe the services being provided and address the concerns raised by the RUC during the Third Five-Year Review.

521

Subcutaneous Excision of Soft Tissue Tumor Codes
There are currently 10 CPT codes that describe subcutaneous excision of soft tissue tumors. For CPT 2010, these 10 codes have been split into 20 codes differentiated by the size of the excised lesion. These codes were never part of a Five-Year Review Process, however, the societies agreed that these codes needed to be consistent with the new coding convention of the subfascial and radical soft tumor excision codes. Between 75-150 general surgeons, otolaryngologists, orthopaedic surgeons, general and orthopaedic surgical oncologists, hand surgeons, plastic surgeons, foot and ankle orthopaedic surgeons, and podiatrists participated in the some or all of the surveys. All of the specialty societies met several times by conference call to discuss the survey statistics. During this review, the societies indicated that they discussed the survey results noting similarities and differences in type of anesthesia positioning, intra-operative time and follow-up care. Several of the codes had exactly the same components which resulted in a recommendation for the same RVU. The specialty societies also indicated that the recommended work RVUs for these codes were correctly ranked. In addition to this analysis, the specialty societies noted that because these codes were never part of a Five-Year

Review Process, they recommended and the RUC agreed that the recommendations for this family of codes should be work neutral. To account for this decision, the specialty societies reduced their recommendations by 2.88%.

Subfascial Excision of Soft Tissue Tumor Codes

There are currently 10 CPT codes that describe subfascial excision of soft tissue tumors. For CPT 2010, these 10 codes have been split into 20 codes differentiated by size of excised lesion. Nine of these 10 original codes were part of one or more Five-Year Review Processes. The single code not originally identified has very low volume. The RUC sympathized with the argument that there should be work valuation changes but requested that codes first be reviewed by the CPT Editorial Panel. Between 75-150 general surgeons, orthopaedic surgeons, general and orthopaedic surgical oncologists, foot and ankle surgeons, podiatrists, otolaryngologists, hand surgeons and plastic surgeons participated in some or all of the surveys. All of the specialty societies met several times by conference call to discuss the survey statistics. During this review, the societies indicated that they discussed the survey results noting similarities and differences in type of anesthesia, positioning, intra-operative time and follow-up care. Several of the codes had exactly the same components which resulted in a recommendation for the same RVU. The specialty societies also indicated that the recommended work RVUs for these codes were correctly ranked.. In addition to this analysis, the societies noted that 18 of the 20 codes were part of a previous Five-Year Review. The societies presented significant compelling evidence as to why these recommendations should not be work neutral. This compelling evidence includes: 1.) Evidence that incorrect assumptions were made in the previous valuation of the service because the Harvard review of these codes did not survey all of the specialties, especially the primary providers, who currently perform these services; and 2.) evidence that technology has changed the physician work because over the past 10 years significant advances have been made which allow for greater imaging and thus more precise understanding of anatomic location and extent of tissue involvement. Based on this compelling evidence and so not to create rank order anomalies, the RUC agreed that the recommendations for the subfascial excision of soft tissue tumor codes did not have to be work neutral. The RUC reviewed the site of service for this family of codes and agreed with the specialty societies data which supported an overnight hospital stay for seven of the large subfascial codes and three of the small subfascial codes. However, to ensure proper rank order across all of the soft tissue tumor codes, the small subfascial excision of soft tissue tumor codes were reduced by 2.88%. Additionally, the RUC recommended significant decreases to the specialty societies' recommendations for the large subfascial tissue tumor codes to ensure proper rank order with the small subfascial excision services, as a primary difference between the small and large subfascial tumor codes was the difference in the intra-service time. The RUC agrees that this adjustment to the large subfascial tissue tumor codes accounts for the 2.88% reduction and maintains the appropriate relativity to the rest of the tumor excision codes.

Radical Excision of Soft Tissue Tumor Codes

There are currently 11 codes that describe radical excision of soft tissue tumors. For CPT 2010, these 11 codes have been split into 22 codes differentiated by size of excised lesion. Six of these 11 codes were part of one or more Five-Year Review Processes. The RUC

sympathized with the argument that there should be work valuation changes but requested that codes first be reviewed by the CPT Editorial Panel. The other five codes have very low volume and are either not performed or rarely performed by orthopaedic surgeons and thus were not included in their comment letters to CMS during the Five-Year Reviews. Between 100-120 general surgeons, otolaryngologists, plastic surgeons, orthopaedic surgeons, orthopaedic and surgical oncologists participated in some or all of the surveys. All of the specialty societies met several times by conference call to discuss the survey statistics. During this review, the societies indicated that they discussed the survey results noting similarities and differences in type of anesthesia, positioning, intra-operative time and follow-up care. Several of the codes had exactly the same components which resulted in a recommendation for the same RVU. The specialty societies also indicated that the recommended work RVUs for these codes were correctly ranked. Further, the societies presented and the RUC agreed that there is significant compelling evidence as to why these recommendations should not be work neutral. This compelling evidence includes: 1.) Evidence that incorrect assumptions were made in the previous valuation of the service because the Harvard review of these codes did not survey all of the specialties who currently perform these services and 2.) Evidence that technology has changed the physician work because over the past 10 years significant advances have been made which allow for greater imaging and thus more precise understanding of anatomic location and extent of tissue involvement. Further, for malignant tumors, adjuvant treatments such as radiation therapy and chemotherapy have advanced greatly. This advancement has allowed for increased ability to kill tumors in situ at a higher level. These tumors are typically asymptomatic and therefore attain large size before being excised. Resecting these lesions with a wide margin in adjacent tissues routinely requires meticulous dissection around major nerves and blood vessels. Based on this compelling evidence and so not to create rank order anomalies, the RUC agreed that the recommendations for the radical excision of soft tissue tumor codes did not have to be work neutral. However, to ensure proper rank order across all of the soft tissue tumor codes, the radical excision of soft tissue tumor codes were reduced by 2.88%.

523

New Codes for Excision of Soft Tissue Tumor Codes

In addition to these revisions to the existing code set, the CPT Editorial Panel created 4 new subcutaneous, 4 new subfascial and 2 new radical excision codes. These codes were created to fill in anatomic gaps in the coding convention for excision of soft tissue tumors. The specialty societies noted that CPT Assistant indicated excision of subcutaneous soft tissue tumors may be reported with benign or malignant lesion codes which have a 10 day global period or an unlisted services code. The specialty societies also noted that excision of deep subfascial tumors or radical soft tissue excision procedures would currently be reported with the unlisted code. However, to ensure proper rank order across all of the soft tissue tumor codes, these new excision of soft tissue tumor codes were reduced by 2.88%. In addition to this reduction, the RUC determined that further reductions should be made to two of the four new subfascial codes to keep in rank order with the recommendations from the other subfascial codes.

Frequency and Impact
The specialties had difficulty in estimating the frequency split for current codes and frequency estimates for new codes but made a best faith effort. The specialties stated that they made several assumptions given the fact that this section has been completely revised including new guidelines and instructions. The RUC appreciated the difficulty of this task and agreed with the specialties recommended utilization. **However, the RUC recommended that these services should be re-reviewed to determine the accuracy of these utilization assumption in three years at the September 2012 RUC meeting to allow for time to obtain two years of frequency data from Medicare (2010 and 2011).** The overall increased work impact of the RUC recommendations for these services, given the society recommended utilization assumptions, is minor.

Repairs Resulting from Excisions
The RUC discussed the issue of separately reporting complex wound repair when performing an excision of a tumor, as the current introductory language states including simple or intermediate repair is included. RUC members expressed concern about complex repair being reported separately with these procedures. After much deliberation, it was determined that these services would rarely require complex repair as defined in CPT codes 13100-13153. However, to alleviate the concern, the CPT Editorial Panel has been requested to add introductory language to this section of codes clarifying the components of complex repair and when it should be reported separately.

524

Practice Expense
The RUC extensively discussed of the clinical labor time associated with the services performed in the non-facility setting and reduced the clinical labor time for several services. In addition, the RUC carefully scrutinized the supplies and equipment and made adjustments to reflect treatment of the typical patient. The practice expense inputs recommended by the specialty in the facility setting were also reviewed and modified. The RUC recommends the attached direct practice expense inputs.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Excision of subcutaneous soft tissue tumors (including simple or intermediate repair) involves the simple or marginal resection of tumors confined to subcutaneous tissue below the skin but above the deep fascia. These tumors are usually benign and are resected without removing a significant amount of surrounding normal tissue. Code selection is based on the location and size of the tumor. Code selection is determined by measuring the greatest diameter of the tumor plus that margin required for complete excision of the tumor. The margins refer to the most narrow margin required to adequately excise the tumor, based on the physician's judgment. The measurement of the tumor plus margin is made at the time of the excision. Appreciable vessel exploration and/or neuroplasty should be reported separately. Extensive undermining or other techniques to close a defect created by skin excision may require a				

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
complex repair which should be reported separately. Dissection or elevation of tissue planes to permit resection of the tumor is included in the excision. ***Excision of fascial or subfascial soft tissue tumors*** (including simple or intermediate repair) involves the resection of tumors confined to the tissue within or below the deep fascia, but not involving the bone. These tumors are usually benign, are often intramuscular, and are resected without removing a significant amount of surrounding normal tissue. Code selection is based on size and location of the tumor. Code selection is determined by measuring the greatest diameter of the tumor plus that margin required for complete excision of the tumor. The margins refer to the most narrow margin required to adequately excise the tumor, based on the physician's judgment. The measurement of the tumor plus margin is made at the time of the excision. Appreciable vessel exploration and/or neuroplasty should be reported separately. Extensive undermining or other techniques to close a defect created by skin excision may require a complex repair which should be reported separately. Dissection or elevation of tissue planes to permit resection of the tumor is included in the excision. Digital (ie, fingers and toes) subfascial tumors are defined as those tumors involving the tendons, tendon sheaths or joints of the digit. Tumors which simply abut but do not breach the tendon, tendon sheath or joint capsule are considered subcutaneous soft tissue tumors. ~~Digital (ie, fingers and toes) subfascial tumors are defined as those tumors involving the tendons, tendon sheaths or joints of the digit. Tumors which simply abut but do not breach the tendon, tendon sheath or joint capsule are considered subcutaneous soft tissue tumors.~~ ***Radical resection of soft tissue tumors*** (including simple or intermediate repair) involves the resection of the tumor with wide margins of normal tissue. Appreciable vessel exploration and/or neuroplasty repair or reconstruction (eg, adjacent tissue transfer[s], flap[s]) should be reported separately. Extensive undermining or other techniques to close a defect created by skin excision may require a complex repair which should be reported separately. Dissection or elevation of tissue planes to permit resection of the tumor is included in the excision. Although these tumors may be confined to a specific layer (eg, subcutaneous, subfascial), radical resection may involve removal of tissue from one or more layers. Radical resection of soft tissue tumors is most commonly used for malignant tumors or very aggressive benign tumors. Code selection is based on size and location of the tumor. Code selection is determined by measuring the greatest diameter of the tumor plus that margin required for complete excision of the tumor. The margins refer to the most narrow margin required to adequately excise the tumor, based on the physician's judgment. The measurement of the tumor plus margin is made at the time of the excision. For radical resection of tumors of cutaneous origin, (eg, melanoma) see 11600-11646. ***Radical resection of bone tumors*** (including simple or intermediate repair) involves the resection of the tumor with wide margins of normal tissue. Appreciable vessel exploration and/or neuroplasty and complex bone repair or reconstruction (eg, adjacent tissue transfer[s], flap[s]) should be reported separately. Extensive undermining or other techniques to close a defect created by skin excision may require a complex repair which should be reported separately. Dissection or elevation of tissue planes to permit resection of the tumor is included in the excision. It may require removal of the entire bone if tumor growth is extensive (eg, clavicle). Radical resection of bone tumors is usually performed for malignant tumors or very aggressive benign tumors. If surrounding soft tissue is removed during these procedures, the radical resection of soft tissue tumor codes should not be reported separately. Code selection is based solely on the location of the tumor, **not** on the size of the tumor or whether the tumor is benign or malignant, primary or metastatic.

Subcutaneous Recommendations

CPT Code #	*Tracking #*	*Global Period*	*RUC rec Work RVU*	*Rationale*
21555	P7	090	3.88	The RUC reviewed the survey data for CPT code 215X0 Excision, tumor, soft tissue of neck or anterior thorax, subcutaneous; less than 3 cm and compared it with its reference code 11642 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter 1.1 to 2.0 cm (Work RVU=2.57) and MPC code 11644 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter 3.1 to 4.0 cm (Work RVU=4.29). The RUC noted that the surveyed code had less intra-service time than the MPC code, 35 minutes and 45 minutes, respectively and that the surveyed code had more intra-service time that the reference code, 35 minutes and 25 minutes, respectively. Further, the RUC noted that the surveyed code required more technical skill, mental effort and judgment to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code and MPC code, the RUC recommends 3.88 RVUs for 215X0, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 3.88 Work RVUs for 215X0.
215X1	P8	090	6.41	The RUC reviewed the survey data for CPT code 215X1 Excision, tumor, soft tissue of neck or anterior thorax, subcutaneous; 3 cm or greater and compared it with its reference code 38510 Biopsy or excision of lymph node(s); open, deep cervical node(s) (Work RVU=6.69) and MPC code 33212 Insertion or replacement of pacemaker pulse generator only; single chamber, atrial or ventricular (Work RVU=5.51). The RUC noted that the surveyed code had more total time than the MPC code, 194 minutes and 187 minutes, respectively. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Further, the RUC noted that the surveyed code required less psychological stress and less urgency of decision making than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code and MPC code, the RUC recommends 6.41 RVUs for 215X1, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 6.41 Work RVUs for 215X1.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
21930	P13	090	4.86	The RUC reviewed the survey data for CPT code 21930 Excision, tumor, soft tissue of back or flank, subcutaneous; less than 3 cm and compared it with its reference code, MPC code 11606 Excision, malignant lesion including margins, trunk, arms, or legs; excised diameter over 4.0 cm (Work RVU=4.97). The RUC noted that the surveyed code and the reference code had similar total service times, 165 minutes and 153 minutes, respectively. The RUC noted that the surveyed code required more technical skill to perform and creates more psychological stress than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code the RUC recommends 4.86 RVUs for 21930, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 4.86 Work RVUs for 21930.
219X1	P14	090	6.80	The RUC reviewed the survey data for CPT code 219X1 Excision, tumor, soft tissue of back or flank, subcutaneous; 3 cm or greater and compared it with its reference code, 38525 Biopsy or excision of lymph node(s); open, deep axillary node(s) (Work RVU=6.35). The RUC noted that the surveyed code had more intra-service time than the reference code, 60 minutes and 45 minutes, respectively and more total service time than the reference code, 206 minutes and 178 minutes respectively. Further, the RUC noted that the surveyed code requires more physical effort to perform and creates more psychological stress than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 6.80 RVUs for 219X1, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 6.80 Work RVUs for 219X1.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
23075	P25	090	4.13	The RUC reviewed the survey data for CPT code 230X0 Excision, soft tissue tumor, soft tissue of shoulder area, subcutaneous; less than 3 cm and compared it with its reference code 11406 Excision, benign lesion including margins, except skin tag (unless listed elsewhere), trunk, arms or legs; excised diameter over 4.0 cm (Work RVU=3.47). The RUC noted that the surveyed code had more total service time that the reference code, 142 minutes and 113 minutes, respectively. Further, the RUC noted that the surveyed code required more technical skill, mental effort and judgment to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 3.88 RVUs for 230X0, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 4.13 Work RVUs for 230X0.
230X1	P26	090	5.83	The RUC reviewed the survey data for CPT code 230X1 Excision, soft tissue tumor, soft tissue of shoulder area, subcutaneous; 3 cm or greater and compared it with its reference code 20680 Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate) (Work RVU=5.90). The RUC noted that the surveyed code and the reference code had similar total service times, 191 minutes and 181 minutes respectively. Further, the RUC noted that the surveyed code and the reference code had similar intensity and complexity measurements with the reference code causing slightly more psychological stress. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code, the RUC recommends 5.83 RVUs for 230X1, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 5.83 Work RVUs for 230X1.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
24075	P34	090	4.16	The RUC reviewed the survey data for CPT code 240X0 Excision, tumor, soft tissue of upper arm or elbow area, subcutaneous; less than 3 cm and compared it with its reference code 11406 Excision, benign lesion including margins, except skin tag (unless listed elsewhere), trunk, arms or legs; excised diameter over 4.0 cm (Work RVU=3.47). The RUC noted that the surveyed code had more total service time than the reference code, 142 minutes and 113 minutes respectively. Further, the RUC noted that the surveyed code required more mental effort, judgment, technical skill and physicial effort to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code, the RUC recommends 4.16 RVUs for 240X0, which is a value below the surveyed 25th percentile. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 4.16 Work RVUs for 240X0.
240X1	P35	090	5.62	The RUC reviewed the survey data for CPT code 240X1 Excision, tumor, soft tissue of upper arm or elbow area, subcutaneous; 3 cm or greater and compared it with its reference code 20680 Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate) (Work RVU=5.90) and MPC code 11606 Excision, malignant lesion including margins, trunk, arms, or legs; excised diameter over 4.0 cm (Work RVU=4.97). Despite similar intensity and complexity measurements, the RUC noted that the surveyed code had less intra-service time as compared to the reference code, 45 minutes and 50 minutes, respectively and that the surveyed code had more total service time than the MPC code, 183 minutes and 153 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code and MPC code, the RUC recommends 5.62 RVUs for 240X1, which is a value below the surveyed 25th percentile. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 5.62 Work RVUs for 240X1.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
25075	P42	090	3.88	The RUC reviewed the survey data for CPT code 250X0 Excision, tumor, soft tissue of forearm and/or wrist area, subcutaneous; less than 3 cm and compared it with its reference code 11406 Excision, benign lesion including margins, except skin tag (unless listed elsewhere), trunk, arms or legs; excised diameter over 4.0 cm (Work RVU=3.47). The RUC noted that the surveyed code had more total service time than the reference code, 137 minutes and 113 minutes respectively. Further, the RUC noted that the surveyed code required more technical skill and overall was a more intense procedure to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 3.88 RVUs for 250X0, which is a value below the surveyed 25th percentile. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 3.88 Work RVUs for 250X0.
250X1	P43	090	5.83	The RUC reviewed the survey data for CPT code 250X1 Excision, tumor, soft tissue of forearm and/or wrist area, subcutaneous; 3 cm or greater and compared it with its reference code 20680 Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate) (Work RVU=5.90). The RUC noted that the surveyed code and the reference code had similar total service times, 178 minutes and 181 minutes respectively. Further, the RUC noted that the surveyed code and the reference code had very similar intensity and complexity measurement with the reference code requiring slightly more physical effort to perform in comparison to the surveyed code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 5.83 RVUs for 250X1, which is a value between the 25th percentile and the surveyed median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 5.83 Work RVUs for 250X1.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
26115	P49	090	3.88	The RUC reviewed the survey data for CPT code 261X0 Excision, tumor or vascular malformation, soft tissue of hand or finger, subcutaneous; less than 1.5 and compared it with its reference code 20680 Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate) (Work RVU=5.90). The RUC noted that the surveyed code had less total service time than the reference code, 137 minutes and 181 minutes respectively. Further, the RUC noted that the surveyed code requires less technical skill, physical effort and overall was a less intense procedure to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 3.88 RVUs for 261X0, which is a value below the surveyed 25th percentile. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 3.88 Work RVUs for 261X0.
261X1	P50	090	5.34	The RUC reviewed the survey data for CPT code 261X1Excision, tumor or vascular malformation, soft tissue of hand or finger, subcutaneous; 1.5 cm or greater and compared it with its reference code, 20680 Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate) (Work RVU=5.90) and MPC code 33212 Insertion or replacement of pacemaker pulse generator only; single chamber, atrial or ventricular (work RVU=5.51). Although, the intensity and complexity measures of the surveyed code and the reference code are the same, the RUC noted that the surveyed code had less intra-service time than the reference code and the MPC code, 40 minutes, 50 minutes and 60 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code and the MPC code, the RUC recommends 5.34 RVUs for 261X1, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 5.34 Work RVUs for 261X1.

CPT Code #	*Tracking #*	*Global Period*	*RUC rec Work RVU*	*Rationale*
27047	P58	090	4.86	The RUC reviewed the survey data for CPT code 270X0 Excision, tumor, soft tissue of pelvis and hip area, subcutaneous tissue; less than 3 cm and compared it with its reference code, 46040 Incision and drainage of ischiorectal and/or perirectal abscess (separate procedure)(Work RVU=5.26) and MPC code 11606 Excision, malignant lesion including margins, trunk, arms, or legs; excised diameter over 4.0 cm (work RVU=4.97). The RUC noted that the surveyed code had less total service time than the reference code, 160 minutes and 184 minutes, respectively and that the surveyed code had similar total service time that the reference code, 160 minutes and 153 minutes, respectively. Further, the RUC noted that the surveyed code required less mental effort and judgment to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code and MPC code, the RUC recommends 4.86 RVUs for 270X0, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 4.86 Work RVUs for 270X0.
270X1	P59	090	6.80	The RUC reviewed the survey data for CPT code 270X1 Excision, tumor, soft tissue of pelvis and hip area, subcutaneous tissue; 3 cm or greater and compared it with its reference code, 38525 Biopsy or excision of lymph node(s); open, deep axillary node(s) (Work RVU=6.35). The RUC noted that the surveyed code had more intra-service time than the reference code, 60 minutes and 45 minutes, respectively and more total service time than the reference code, 206 minutes and 178 minutes respectively. Further, the RUC noted that the surveyed code required more technical skill, physical effort to perform and creates more psychological stress than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 6.80 RVUs for 270X1, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 6.80 Work RVUs for 270X1.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
27327	P68	090	3.88	The RUC reviewed the survey data for CPT code 273X0 Excision, tumor, soft tissue of thigh or knee area;, subcutaneous; less than 3 cm and compared it with its reference code 11622 Excision, malignant lesion including margins, scalp, neck, hands, feet, genitalia; excised diameter 1.1 to 2.0 cm(Work RVU=2.36). The RUC noted that the surveyed code had more total service time than the reference code, 140 minutes and 87 minutes respectively. Further, the RUC noted that the surveyed code requires more technical skill and overall was a more intense procedure to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 3.88 RVUs for 273X0, which is a value below the surveyed 25th percentile. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 3.88 Work RVUs for 273X0.
273X1	P69	090	5.83	The RUC reviewed the survey data for CPT code 273X1Excision, tumor, soft tissue of thigh or knee area;, subcutaneous; 3 cm or greater and compared it with its reference code 20680 Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate) (Work RVU=5.90). The RUC noted that the surveyed code and the reference code had the same total service times, 181 minutes. Further, the RUC noted that the surveyed code and the reference code had similar intensity and complexity measurements with the reference code requiring slightly more technical skill and physical effort to perform in comparison to the surveyed code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 5.83 RVUs for 273X1, which is a value between the 25th percentile and the surveyed median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 5.83 Work RVUs for 273X1.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
27618	P77	090	3.88	The RUC reviewed the survey data for CPT code 276X0 Excision, tumor, soft tissue of leg or ankle area;, subcutaneous; less than 3 cm and compared it with its reference code 11406 Excision, benign lesion including margins, except skin tag (unless listed elsewhere), trunk, arms or legs; excised diameter over 4.0 cm (Work RVU=3.47). The RUC noted that the surveyed code had more total service time than the reference code, 137 minutes and 113 minutes respectively. Further, the RUC noted that the surveyed code required more mental effort and judgment and overall was a more intense procedure to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 3.88 RVUs for 276X0, which is a value below the surveyed 25th percentile. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 3.88 Work RVUs for 276X0.
276X1	P78	090	5.83	The RUC reviewed the survey data for CPT code 276X1 Excision, tumor, soft tissue of leg or ankle area;, subcutaneous; 3 cm or greater and compared it with its reference code 20680 Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate) (Work RVU=5.90) and MPC code 11606 Excision, malignant lesion including margins, trunk, arms, or legs; excised diameter over 4.0 cm (Work RVU=4.97). The RUC noted that the surveyed code and the reference codes had very similar total service times, 183 minutes and 181 minutes, respectively and that the surveyed code had more total service time than the MPC code, 183 minutes and 153 minutes, respectively. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code and MPC code, the RUC recommends 5.83 RVUs for 276X1, which is a value below the surveyed 25th percentile. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 5.83 Work RVUs for 276X1.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
28043	P86	090	3.88	The RUC reviewed the survey data for CPT code 280X0 Excision, tumor, soft tissue of foot or toe, subcutaneous; less than 1.5 cm and compared it with its reference code 11422 Excision, benign lesion including margins, except skin tag (unless listed elsewhere), scalp, neck, hands, feet, genitalia; excised diameter 1.1 to 2.0 cm (Work RVU=1.65). The RUC noted that the surveyed code had significantly more total service time than the reference code, 138 minutes and 56 minutes respectively. Further, the RUC noted that the surveyed code required more technical skill and physical effort to perform than the reference code. In addition the RUC compared the surveyed code to another reference code 11406 Excision, benign lesion including margins, except skin tag (unless listed elsewhere), trunk, arms or legs; excised diameter over 4.0 cm (Work RVU=3.47) and noted that the surveyed code has more total service time than this reference code, 138 minutes and 113 minutes respectively. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 3.88 RVUs for 280X0, which is a value between the 25th percentile and the surveyed median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 3.88 Work RVUs for 280X0.
280X1	P87	090	5.34	The RUC reviewed the survey data for CPT code 280X1 Excision, tumor, soft tissue of foot or toe, subcutaneous; 1.5 cm or greater and compared it with its reference code, 28289 Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint (Work RVU=8.11). The RUC noted that the surveyed code had less total-service time than the reference code, 153 minutes and 197 minutes, respectively. Further, the RUC noted that the surveyed code required more technical skill, physical effort to perform and creates more psychological stress to perform than the reference code. Further, the RUC compared the surveyed code to MPC code 33212 Insertion or replacement of pacemaker pulse generator only; single chamber, atrial or ventricular (Work RVU=5.51) and noted that the surveyed code has significantly more total time than the surveyed code, 187 minutes and 153 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 5.34 RVUs for 280X1, which is a value in between the 25th percentile and survey median. As mentioned in the overall rationale, the RUC agreed that the subcutaneous codes should be work neutral, therefore, the RUC recommended value takes into account the 2.88% reduction applied to all of the subcutaneous codes. The RUC recommends 5.34 Work RVUs for 280X1.

Subfascial Recommendations

CPT Code #	*Tracking #*	*Global Period*	*RUC rec Work RVU*	*Rationale*
21556	P9	090	7.53	The RUC reviewed the survey data for CPT code 215X2 Excision, tumor, soft tissue of neck or anterior thorax, subfascial (eg, intramuscular); less than 5 cm and compared it with its reference code 38510 Biopsy or excision of lymph node(s); open, deep cervical node(s) (Work RVU=6.69). The RUC noted that the surveyed code has more total service time than the reference code, 234 minutes and 152 minutes respectively. Further, the RUC noted that the surveyed code requires more mental effort and judgment and technical skill to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 7.53 RVUs for 215X2, which is a value between the 25th percentile and survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 7.53 Work RVUs for 215X2.
215X3	P10	090	11.00	The RUC reviewed the survey data for CPT code 215X3 Excision, tumor, soft tissue of neck or anterior thorax, subfascial (eg, intramuscular); 5 cm or greater and compared it with its reference code 38700 Suprahyoid lymphadenectomy (Work RVU=12.68). The RUC noted that although the surveyed code and the reference code have the same intra-service time, 90 minutes, the RUC agreed that this was a poor reference code. The RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs needed to be reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Therefore, the RUC agreed that a better reference code would be 27822 Open treatment of trimalleolar ankle fracture, includes internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip (Work RVU=11.03) as the surveyed code and 27822 reference code have the same intra-service time, 90 minutes and similar intensity of work. Due to these comparisons between the surveyed code and the 27822 reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends the survey 25th percentile, 11.00 RVUs for 215X3. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 11.00 Work RVUs for 215X3.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
22900	P21	090	8.21	The RUC reviewed the survey data for CPT code 22900 Excision, tumor, soft tissue of abdominal wall tumor, subfascial (eg, desmoid intramuscular); less than 5 cm and compared it with its reference code 49505 Repair initial inguinal hernia, age 5 years or older; reducible (Work RVU=7.88). The RUC reviewed the survey data and agreed with the specialty society that a hospital visit and full day discharge visit were appropriate as majority of survey respondents who stated that they typically perform this procedure in the hospital stated that the patient is kept overnight or admitted. In addition, the RUC noted that the surveyed code as compared to the reference code has more total service time (244 minutes and 198 minutes). Further, the RUC noted that the surveyed code requires more mental effort and judgment, technical skill and physical effort to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 8.21 RVUs for 22900, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 8.21 Work RVUs for 22900.
229X2	P22	090	10.00	The RUC reviewed the survey data for CPT code 229X2 Excision, tumor, soft tissue of abdominal wall tumor, subfascial (eg, desmoid intramuscular); 5 cm or greater and compared it with its reference code 49560 Repair initial incisional or ventral hernia; reducible (Work RVU=11.84). The RUC noted that although the surveyed code and the reference code have the same intra-service time, 90 minutes, the RUC agreed that this was a poor reference code. The RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs were reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Therefore, the RUC agreed that a better reference code would be 25115 Radical excision of bursa, synovia of wrist, or forearm tendon sheaths (eg, tenosynovitis, fungus, Tbc, or other granulomas, rheumatoid arthritis); flexors (Work RVU=9.89). The RUC agreed that 25115 was a better reference because the surveyed code and 25115 reference code have 1.) similar intensities of work, 2.) the same intra-service time, 90 minutes and 3.) the 25115 reference code has slightly less total service time as compared to the surveyed code, 257 minutes and 284 minutes. Due to these comparisons between the surveyed code and the 25115 reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends 10.00 RVUs, a value below the surveyed 25th percentile, for 229X2. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 10.00 Work RVUs for 229X2.

CPT Code #	*Tracking #*	*Global Period*	*RUC rec Work RVU*	*Rationale*
23076	P27	090	7.28	The RUC reviewed the survey data for CPT code 230X2 Excision, tumor, soft tissue of tumor shoulder area; deep, subfascial (eg, intramuscular); less than 5 cm and compared it with its reference code 13132 Repair, complex, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; 2.6 cm to 7.5 cm (Work RVU=6.48). The RUC noted that the surveyed code as compared to the reference code has more intra-service time (60 minutes and 45 minutes) and more total service time (221 minutes and 136 minutes). Further, the RUC noted that the surveyed code requires more mental effort and judgment, technical skill and physical effort to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 7.28 RVUs for 230X2, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 7.28 Work RVUs for 230X2.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
230X3	P28	090	10.00	The RUC reviewed the survey data for CPT code 230X3 Excision, tumor, soft tissue of tumor shoulder area; deep, subfascial (eg, intramuscular); 5 cm or greater and compared it with its reference code 29828 Arthroscopy, shoulder, surgical; biceps tenodesis (Work RVU=13.00). The RUC determined that the pre-service time package selected by the specialty society did not accurately reflect the pre-service time to perform the procedure. Therefore, the RUC modified the pre-service package associated with this service to pre-service time package three as the RUC agreed that the vignette described a more staightforward patient. Further, the RUC noted that although the surveyed code and the reference code have the same intra-service time, 75 minutes, the RUC agreed that this was a poor reference code. The RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs were reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Therefore, the RUC agreed that a better reference code would be 27832 Open treatment of proximal tibiofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula (Work RVU=10.01). The RUC agreed that 27832 was a better reference because the surveyed code and 27832 reference code have 1.) similar intensities of work, 2.) the same intra-service time, 75 minutes and 3.) the 27832 reference code has very similar total service times as compared to the surveyed code, 301 minutes and 297 minutes. Due to these comparisons between the surveyed code and the 27832 reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends the surveyed 25th percentile,10.00 RVUs, for 230X3. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 10.00 Work RVUs for 230X3.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
24076	P36	090	7.28	The RUC reviewed the survey data for CPT code 240X2 Excision, tumor, soft tissue of upper arm or elbow area, subfascial (eg, intramuscular); less than 5 cm and compared it with its reference code 25109 Excision of tendon, forearm and/or wrist, flexor or extensor, each (Work RVU=6.81). The RUC noted that the surveyed code as compared to the reference code has more intra-service time (60 minutes and 40 minutes) and more total service time (229 minutes and 191 minutes). Further, the RUC noted that the surveyed code requires more mental effort and judgment, technical skill and physical effort to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 7.28 RVUs for 240X2, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 7.28 Work RVUs for 240X2.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
240X3	P37	090	10.00	The RUC reviewed the survey data for CPT code 240X3 Excision, tumor, soft tissue of upper arm or elbow area, subfascial (eg, intramuscular); 5 cm or greater and compared it with its reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC determined that the pre-service time package selected by the specialty society did not accurately reflect the pre-service time to perform the procedure. Therefore, the RUC modified the pre-service package associated with this service to pre-service time package three as the RUC agreed that the vignette described a more straightforward patient. Further, the RUC noted that although the surveyed code has less total service time than the reference code, 295 minutes and 358 minutes, respectively, the RUC agreed that this was a poor reference code. The RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs needed to be reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Therefore, the RUC agreed that a better reference code would be 27832 Open treatment of proximal tibiofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula (Work RVU=10.01). The RUC agreed that 27832 was a better reference because the surveyed code and 27832 reference code have 1.) similar intensities of work, 2.) the same intra-service time, 75 minutes and 3.) the 27832 reference code has very similar total service times as compared to the surveyed code, 301 minutes and 295 minutes. Due to these comparisons between the surveyed code and the 27832 reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends 10.00 RVUs, a value below the surveyed 25th percentile, for 240X3. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 10.00 Work RVUs for 240X3.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
25076	P44	090	6.61	The RUC reviewed the survey data for CPT code 250X2 Excision, tumor, soft tissue of forearm and/or wrist area, subfascial (eg, intramuscular); less than 3 cm and compared it with its reference code 25109 Excision of tendon, forearm and/or wrist, flexor or extensor, each (Work RVU=6.81). The RUC noted that the surveyed code and the reference code have very similar intra-service times (45 minutes and 40 minutes, respectively and total service times (206 minutes and 191 minutes, respectively) Further, the RUC noted that the surveyed code and the reference code have very similar intensity and complexity measurements. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 6.61 RVUs for 250X2, which is a value between the 25th percentile and survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 6.61 Work RVUs for 250X2.
250X3	P45	090	7.00	The RUC reviewed the survey data for CPT code 250X3 Excision, tumor, soft tissue of forearm and/or wrist area, subfascial (eg, intramuscular); 3 cm or greater and compared it with its reference code 25115 Radical excision of bursa, synovia of wrist, or forearm tendon sheaths (eg, tenosynovitis, fungus, Tbc, or other granulomas, rheumatoid arthritis); flexors (Work RVU=9.89). The RUC noted that the surveyed code has less intra-service time than the reference code, 60 minutes and 90 minutes, respectively. During its discussion, the RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs were reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Therefore, the RUC agreed that a better reference code would be 38520 Biopsy or excision of lymph node(s); open, deep cervical node(s) with excision scalene fat pad (Work RVU=6.95). The RUC agreed that 38520 was a better reference because the surveyed code and the 38520 reference code have 1.) similar intensities of work, 2.) the same intra-service time, 60 minutes and 3.) the 38520 reference code has slightly less total service time as compared to the surveyed code, 193 minutes and 221 minutes. Due to these comparisons between the surveyed code and the 38520 reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends 7.00 RVUs, a value below the surveyed 25th percentile, for 250X3. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 7.00 Work RVUs for 250X3.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
26116	P51	090	6.61	The RUC reviewed the survey data for CPT code 261X2 Excision, tumor, soft tissue, or vascular malformation, soft tissue of hand or finger; subfascial (eg, intramuscular); less than 1.5 cm and compared it with its reference code 25109 Excision of tendon, forearm and/or wrist, flexor or extensor, each (Work RVU=6.81). The RUC noted that the surveyed code and the reference code have very similar intra-service times (45 minutes and 40 minutes, respectively and total service times (201 minutes and 191 minutes, respectively) Further, the RUC noted that the surveyed code and the reference code have very similar intensity and complexity measurements. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 6.61 RVUs for 261X2, which is a value between the 25th percentile and survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 6.61 Work RVUs for 261X2.
261X3	P52	090	7.00	The RUC reviewed the survey data for CPT code 280X3 Excision, tumor, soft tissue, or vascular malformation, soft tissue of hand or finger; subfascial (eg, intramuscular); 1.5 cm or greater and compared it with its reference code 25109 Excision of tendon, forearm and/or wrist, flexor or extensor, each (Work RVU=6.81). The RUC noted that the surveyed code as compared to the reference code has more intra-service time (58 minutes and 40 minutes, respectively and total service time (214 minutes and 191 minutes, respectively). Furthermore the RUC noted that the surveyed code requires greater mental effort and judgment to perform than the surveyed code. However, the RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs were reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Due to these comparisons between the surveyed code and the reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends 7.00 RVUs, a value slightly higher than the surveyed 25th percentile for 261X3. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 7.00 Work RVUs for 261X3.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
27048	P60	090	8.74	The RUC reviewed the survey data for CPT code 270X2 Excision, tumor, soft tissue of pelvis and hip area subfascial (eg, intramuscular); less than 5 cm and compared it with MPC code 14040 Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less (Work RVU=8.44). The RUC noted that when comparing the surveyed code to MPC code 14040 Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less (Work RVU=8.44), the surveyed code has more total service time than this MPC reference code, 288 minutes and 223 minutes . Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 8.74 RVUs for 270X2, which is a value between 25th percentile and the survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 8.74 Work RVUs for 270X2.
270X3	P61	090	11.00	The RUC reviewed the survey data for CPT code 270X3 Excision, tumor, soft tissue of pelvis and hip area subfascial (eg, intramuscular); 5 cm or greater and compared it with its reference code 47100 Biopsy of liver, wedge (Work RVU=12.78). The RUC noted that although the surveyed code has less total service time than the reference code, 320 minutes and 345 minutes, respectively. The RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs were reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Therefore, the RUC agreed that a better reference code would be 27822 Open treatment of trimalleolar ankle fracture, includes internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip (Work RVU=11.03) as the surveyed code and 27822 reference code have the same intra-service time, 90 minutes and similar intensity of work. Due to these comparisons between the surveyed code and the 27822 reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends the surveyed 25th percentile of 11.00 RVUs for 270X3. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 11.00 Work RVUs for 270X3.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
27328	P70	090	8.74	The RUC reviewed the survey data for CPT code 273X2 Excision, tumor, soft tissue of thigh or knee area subfascial (eg, intramuscular); less than 5 cm and compared it with its reference code 15100 Split-thickness autograft, trunk, arms, legs; first 100 sq cm or less, or 1% of body area of infants and children (except 15050) (Work RVU=9.74). The RUC noted that the surveyed code and the reference code have similar intensity and complexity measures and the surveyed code as compared to the reference code has comparable total service time (261 minutes and 281 minutes). The RUC noted that when comparing the surveyed code to MPC code 14040 Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less (Work RVU=8.44), the surveyed code has more total service time than this MPC reference code, 261 minutes and 223 minutes . Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 8.74 RVUs for 273X2, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 8.74 Work RVUs for 273X2.
273X3	P71	090	11.00	The RUC reviewed the survey data for CPT code 273X3 Excision, tumor, soft tissue of thigh or knee area subfascial (eg, intramuscular); 5 cm or greater and compared it with its reference code 27880 Amputation, leg, through tibia and fibula; (Work RVU=15.24). The RUC noted that although the surveyed code has less total service time than the reference code, 310 minutes and 423 minutes, respectively, and agreed that this was a poor reference code. The RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs needed to be reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Therefore, the RUC agreed that a better reference code would be 27822 Open treatment of trimalleolar ankle fracture, includes internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip (Work RVU=11.03) as the surveyed code and 27822 reference code have the same intra-service time, 90 minutes and similar intensity of work. Due to these comparisons between the surveyed code and the 27822 reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends 11.00 RVUs, a value below the surveyed 25th percentile, for 273X3. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 11.00 Work RVUs for 273X3.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
27619	P79	090	6.80	The RUC reviewed the survey data for CPT code 276X2 Excision, tumor, soft tissue of leg or ankle area subfascial (eg, intramuscular); less than 5 cm and compared it with its reference code 15100 Split-thickness autograft, trunk, arms, legs; first 100 sq cm or less, or 1% of body area of infants and children (except 15050) (Work RVU=9.74). The RUC noted that the surveyed code has less total service time than the reference code, 225 minutes and 281 minutes, respectively. Further, the RUC noted that the reference code causes more psychological stress to perform than the surveyed code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 6.80 RVUs for 276X2, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 6.80 Work RVUs for 276X2.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
276X3	P80	090	10.00	The RUC reviewed the survey data for CPT code 276X3 Excision, tumor, soft tissue of leg or ankle area subfascial (eg, intramuscular); 5 cm or greater and compared it with its reference code 28299 Excision, tumor, soft tissue of leg or ankle area subfascial (eg, intramuscular); (Work RVU=11.39). When reviewing the pre-service time packages, the RUC determined that the pre-service time package selected by the specialty society did not accurately reflect the pre-service time to perform the procedure. Therefore, the RUC modified the pre-service package associated with this service to pre-service time package three as the RUC agreed that the vignette described a more staightforward patient. Further, the RUC noted that although the surveyed code has less intra-service time than the reference code, 70 minutes and 90 minutes respectively, the RUC agreed that this was a poor reference code. The RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs needed to be reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Therefore, the RUC agreed that a better reference code would be 27832 Open treatment of proximal tibiofibular joint dislocation, includes internal fixation, when performed, or with excision of proximal fibula (Work RVU=10.01). The RUC agreed that 27832 was a better reference because the surveyed code and 27832 reference code have 1.) similar intensities of work, 2.) the similar intra-service times, 70 minutes and 75 minutes and 3.) the 27832 reference code has very similar total service times as compared to the surveyed code, 301 minutes and 293 minutes. Due to these comparisons between the surveyed code and the 27832 reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends the surveyed 25th percentile, 10.00 RVUs, for 276X3. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 10.00 Work RVUs for 276X3.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
28045	P88	090	5.34	The RUC reviewed the survey data for CPT code 280X2 Excision, tumor, soft tissue of foot or toe, subfascial (eg, intramuscular); less than 1.5 cm and compared it with its reference code 13121 Repair, complex, scalp, arms, and/or legs; 2.6 cm to 7.5 cm (Work RVU=4.36). The RUC noted that the surveyed code has more total service time than the reference code, 169 minutes and 117 minutes respectively. Further, the RUC noted that the surveyed code requires more mental effort and judgment and technical skill to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 5.34 RVUs for 280X2, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 5.34 Work RVUs for 280X2.
280X3	P89	090	7.00	The RUC reviewed the survey data for CPT code 280X3 Excision, tumor, soft tissue of foot or toe, subfascial (eg, intramuscular); 1.5 cm or greater and compared it with its reference code 29891 Arthroscopy, ankle, surgical, excision of osteochondral defect of talus and/or tibia, including drilling of the defect (Work RVU=9.47). The RUC noted that although the surveyed code has less total service time than the reference code, 217 minutes and 227 minutes, respectively, the RUC agreed that this was a poor reference code. The RUC determined that as the primary difference between the small and large subfascial tumor codes is the difference in the intra-service time, the specialty requested RVUs needed to be reduced to more accurately reflect the work associated with this service and to preserve the rank order with the small subfascial family of codes. Therefore, the RUC agreed that a better reference code would be 38520 Biopsy or excision of lymph node(s); open, deep cervical node(s) with excision scalene fat pad (Work RVU=6.95). The RUC agreed that 38520 was a better reference because the surveyed code and the 38520 reference code have 1.) similar intensities of work, 2.) the same intra-service time, 60 minutes and 3.) the 38520 reference code has slightly less total service time as compared to the surveyed code, 193 minutes and 217 minutes. Due to these comparisons between the surveyed code and the 38520 reference code and to maintain relativity with the small subfascial excision codes, the RUC recommends 7.00 RVUs, a value between the 25th percentile and surveyed median, for 280X3. As described in the overall rationale, the RUC agreed that in order to maintain relativity with the recommendations for the subcutaneous codes, the recommendations for the subfascial codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the subfascial codes. The RUC recommends 7.00 RVUs for Work 280X3.

Radical Recommendations

CPT Code #	*Tracking #*	*Global Period*	*RUC rec Work RVU*	*Rationale*
21015	P5	090	9.71	The RUC reviewed the survey data for CPT code 21015 Radical resection of tumor (eg, malignant neoplasm), soft tissue of face or scalp; less than 2 cm and compared it with its reference code 38700 Suprahyoid lymphadenectomy (Work RVU=12.68). The RUC noted that the surveyed code as compared to the reference code has less intra service time (75 minutes and 90 minutes, respectively) and less total service time (277 minutes and 300 minutes). Further, the RUC noted that the surveyed code overall is a less intense procedure to perform than the reference code. In addition, the RUC compared the surveyed code to MPC code 15100 Split-thickness autograft, trunk, arms, legs; first 100 sq cm or less, or 1% of body area of infants and children (except 15050) (Work RVU=9.74). The RUC noted that the surveyed code in comparison to the MPC code has similar total service times, 277 minutes and 281 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code and the MPC code, the RUC recommends 9.71 RVUs for 21015, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 9.71 Work RVUs for 21015.
210X5	P6	090	15.05	The RUC reviewed the survey data for CPT code 210X5 Radical resection of tumor (eg, malignant neoplasm), soft tissue of face or scalp; 2 cm or greater and compared it with its reference code 41130 Glossectomy; hemiglossectomy (Work RVU=15.51). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code has slightly less total service time as compared to the reference code, 398 minutes and 407 minutes, respectively. In addition, the RUC compared the surveyed code to another reference code 27880 Amputation, leg, through tibia and fibula; (Work RVU=15.24). The RUC noted that the surveyed code as compared to the reference code has very similar total service time (398 minutes and 400 minutes). Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 15.05 RVUs for 210X5, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 15.05 Work RVUs for 210X5.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
21557	P11	090	14.57	The RUC reviewed the survey data for CPT code 21557 Radical resection of tumor (eg, malignant neoplasm), soft tissue of neck or anterior thorax; less than 5 cm and compared it with its reference code 38700 Suprahyoid lymphadenectomy (Work RVU=12.68). The RUC noted that the surveyed code as compared to the reference code has more intra-service time, 113 minutes and 90 minutes, respectively and more total service time than the reference code, 398 minutes and 300 minutes respectively. Further, the RUC noted that the surveyed code requires more mental effort and judgment and more physical effort to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 14.57 RVUs for 21557, which is a value between the 25th percentile and the survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 14.57 Work RVUs for 21557.
215X4	P12	090	21.37	The RUC reviewed the survey data for CPT code 215X4 Radical resection of tumor (eg, malignant neoplasm), soft tissue of neck or anterior thorax; 5 cm or greater and compared it with reference code 15734 Muscle, myocutaneous, or fasciocutaneous flap; trunk (Work RVU=19.62). The RUC noted that although the surveyed code and the reference code have similar intra-service times, 160 minutes and 163 minutes, respectively, the surveyed procedure requires significantly more mental effort and judgment, technical skill, and physical effort to perform as compared to the reference code. In addition, the RUC compared the surveyed code to MPC code 35656 Bypass graft, with other than vein; femoral-popliteal (Work RVU=20.39). The RUC noted that the surveyed code has more total service time as compared to the MPC code, 480 minutes and 447 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 21.37 RVUs for 215X4, which is a value between the 25th percentile and surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 21.37 Work RVUs for 215X4.

559

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
21935	P17	090	15.54	The RUC reviewed the survey data for CPT code 21935 Radical resection of tumor (eg, malignant neoplasm), soft tissue of back or flank; less than 5 cm and compared it with its reference code 27880 Amputation, leg, through tibia and fibula; (Work RVU=15.24). The RUC noted that the surveyed code as compared to the reference code has more intra service time (120 minutes and 80 minutes, respectively) and very similar total service time (408 minutes and 400 minutes). Further, the RUC noted that the surveyed code overall is a slightly more intense procedure to perform than the reference code. In addition, the RUC compared the surveyed code to another reference code 41130 Glossectomy; hemiglossectomy (Work RVU=15.51). The RUC noted that the surveyed code and the reference code have very similar total service times, 408 minutes and 407 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference codes, the RUC recommends 15.54 RVUs for 21935, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 15.54 Work RVUs for 21935.
219X4	P18	090	22.34	The RUC reviewed the survey data for CPT code 219X4 Radical resection of tumor (eg, malignant neoplasm), soft tissue of back or flank; 5cm or greater and compared it with its reference code 49203 Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, 1 or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less (Work RVU=20.00). The RUC noted that the surveyed code has more intra-service time than the reference code, 160 minutes and 120 minutes respectively and more total service time than the reference code, 510 minutes and 420 minutes, respectively . Further, the RUC noted that the surveyed code requires more mental effort and judgment, more technical skill and physical effort to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 22.34 RVUs for 219X4, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 22.34 Work RVUs for 219X4.

560

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
23077	P29	090	17.48	The RUC reviewed the survey data for CPT code 23077 Radical resection of tumor (eg, malignant neoplasm), soft tissue of shoulder area; less than 5 cm and compared it with its reference code 23395 Muscle transfer, any type, shoulder or upper arm; single (Work RVU=18.29). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code as compared to the reference code has less intra service time (140 minutes and 160 minutes, respectively). In addition, the RUC compared the surveyed code to another reference code 58150 Total abdominal hysterectomy (corpus and cervix), with or without removal of tube(s), with or without removal of ovary(s); (Work RVU=17.21). The RUC noted that the surveyed code in comparison to the reference code has more intra-service time, 140 minutes and 120 minutes and more total service times, 433 minutes and 394 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 17.48 RVUs for 23077, which is a value between the 25th percentile and the survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 17.48 Work RVUs for 23077.
230X4	P30	090	22.34	The RUC reviewed the survey data for CPT code 230X4 Radical resection of tumor (eg, malignant neoplasm), soft tissue of shoulder area; 5 cm or greater and compared it with reference code 44140 Colectomy, partial; with anastomosis (Work RVU=22.46). The RUC noted that the surveyed code and the reference code have very similar total service times, 490 minutes and 480 minutes, respectively. In addition, the RUC compared the surveyed code to MPC code 35656 Bypass graft, with other than vein; femoral-popliteal (Work RVU=20.39). The RUC noted that the surveyed code has more intra-service time than the MPC code, 180 minutes and 150 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 22.34 RVUs for 230X4, which is a value between the 25th percentile and surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 22.34 Work RVUs for 230X4.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
24077	P38	090	15.54	The RUC reviewed the survey data for CPT code 240X4 Radical resection of tumor (eg, malignant neoplasm), soft tissue of upper arm or elbow area; less than 5 cm and compared it with its reference code 23395 Muscle transfer, any type, shoulder or upper arm; single (Work RVU=18.29). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code as compared to the reference code has less intra service time (120 minutes and 160 minutes, respectively). In addition, the RUC compared the surveyed code to another reference code 41130 Glossectomy; hemiglossectomy (Work RVU=15.51). The RUC noted that the surveyed code in comparison to the reference code has similar total service times, 405 minutes and 407 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference codes, the RUC recommends 15.54 RVUs for 240X4, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 15.54 Work RVUs for 240X4.
240X5	P39	090	20.40	The RUC reviewed the survey data for CPT code 240X5 Radical resection of tumor (eg, malignant neoplasm), soft tissue of upper arm or elbow area; 5 cm or greater and compared it with reference code 44140 Colectomy, partial; with anastomosis (Work RVU=22.46). The RUC noted that the surveyed code has less total service time as compared to the reference code, 472 minutes and 480 minutes, respectively. In addition, the RUC compared the surveyed code to MPC code 35656 Bypass graft, with other than vein; femoral-popliteal (Work RVU=20.39). The RUC noted that the surveyed code and the MPC code have the same intra-service time, 150 minutes. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 20.40 RVUs for 240X5, which is a value between the 25th percentile and surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 20.40 Work RVUs for 240X5.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
25077	P46	090	12.75	The RUC reviewed the survey data for CPT code 25077 Radical resection of tumor (eg, malignant neoplasm), soft tissue of forearm and/or wrist area; less than 3 cm and compared it with its reference code 25515 Open treatment of radial shaft fracture, includes internal fixation, when performed (Work RVU=9.89). The RUC noted that the surveyed code as compared to the reference code has more intra-service time, 100 minutes and 90 minutes, respectively and more total service time than the reference code, 345 minutes and 257 minutes respectively. Further, the RUC noted that the surveyed code requires more mental effort and judgment, more technical skill and overall is a much more intense procedure to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 12.75 RVUs for 25077, which is a value between the 25th percentile and the survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 12.75 Work RVUs for 25077.
250X4	P47	090	17.48	The RUC reviewed the survey data for CPT code 250X4 Radical resection of tumor (eg, malignant neoplasm), soft tissue of forearm and/or wrist area; 3 cm or greater and compared it with its reference code 24363 Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow) (Work RVU=22.47). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code has less total service time as compared to the reference code, 422 minutes and 466 minutes, respectively and less intra-service time, 120 minutes and 150 minutes respectively. In addition, the RUC compared the surveyed code to MPC code 58150 Total abdominal hysterectomy (corpus and cervix), with or without removal of tube(s), with or without removal of ovary(s); (Work RVU=17.21). The RUC noted that the surveyed code as compared to the reference code has more total service time, 422 minutes and 394 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 17.48 RVUs for 250X4, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 17.48 Work RVUs for 250X4.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
26117	P53	090	9.95	The RUC reviewed the survey data for CPT code 26117 Radical resection of tumor (eg, malignant neoplasm), soft tissue of hand or finger; less than 3 cm and compared it with its reference code 25447 Arthroplasty, interposition, intercarpal or carpometacarpal joints (Work RVU=10.95). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code as compared to the reference code has less intra service time (75 minutes and 100 minutes, respectively). In addition, the RUC compared the surveyed code to MPC code 15100 Split-thickness autograft, trunk, arms, legs; first 100 sq cm or less, or 1% of body area of infants and children (except 15050) (Work RVU=9.74). The RUC noted that the surveyed code in comparison to the MPC code has more intra-service time, 75 minutes and 60 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code and the MPC code, the RUC recommends 9.95 RVUs for 26117, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 9.95 Work RVUs for 26117.
261X4	P54	090	14.57	The RUC reviewed the survey data for CPT code 261X4 Radical resection of tumor (eg, malignant neoplasm), soft tissue of hand or finger; 3 cm or greater and compared it with its reference code 24363 Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow) (Work RVU=22.47). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code as compared to the reference code has less intra service time (100 minutes and 150 minutes, respectively) and less total service time (368 minutes and 466 minutes). In addition, the RUC compared the surveyed code to another reference code 25609 Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments (Work RVU=14.12). The RUC noted that the surveyed code in comparison to this reference code has more total service time, 368 minutes and 358 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 14.57 RVUs for 261X4, which is a value between the 25th percentile and the survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 14.57 Work RVUs for 261X4.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
27049	P62	090	21.37	The RUC reviewed the survey data for CPT code 270X4 Radical resection of tumor (eg, malignant neoplasm), soft tissue of pelvis and hip area; less than 5 cm and compared it with its reference code 47380 Ablation, open, of one or more liver tumor(s); radiofrequency (Work RVU=24.43). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code as compared to the reference code has less intra service time (180 minutes and 200 minutes, respectively). In addition, the RUC compared the surveyed code to MPC code 35656 Bypass graft, with other than vein; femoral-popliteal (Work RVU=20.39). The RUC noted that the surveyed code in comparison to the MPC code has more intra-service time, 180 minutes and 150 minutes and more total service times, 496 minutes and 447 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 21.37 RVUs for 270X4, which is a value between the 25th percentile and the survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 21.37 Work RVUs for 270X4.
270X5	P63	090	29.14	The RUC reviewed the survey data for CPT code 270X5 Radical resection of tumor (eg, malignant neoplasm), soft tissue of pelvis and hip area; 5 cm or greater and compared it with its reference code 27134 Revision of total hip arthroplasty; both components, with or without autograft or allograft (Work RVU=30.13). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code as compared to the reference code has less intra service time (220 minutes and 240 minutes, respectively). In addition, the RUC noted that the surveyed code in comparison to the reference code has similar total service times, 608 minutes and 617 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 29.14 RVUs for 270X5, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 29.14 Work RVUs for 270X5.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
27329	P72	090	15.54	The RUC reviewed the survey data for CPT code 273X4 Radical resection of tumor (eg, malignant neoplasm), soft tissue of thigh or knee area; less than 5 cm and compared it with its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code as compared to the reference code has less total service time (413 minutes and 469 minutes, respectively). In addition, the RUC compared the surveyed code to another reference code 41130 Glossectomy; hemiglossectomy (Work RVU=15.51). The RUC noted that the surveyed code in comparison to the reference code has similar total service times, 413 minutes and 407 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference codes, the RUC recommends 15.54 RVUs for 273X4, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 15.54 Work RVUs for 273X4.
273X5	P73	090	24.28	The RUC reviewed the survey data for CPT code 273X5 Radical resection of tumor (eg, malignant neoplasm), soft tissue of thigh or knee area; 5cm or greater and compared it with its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). The RUC noted that the surveyed code has more intra-service time than the reference code, 180 minutes and 124 minutes respectively and more total service time than the reference code, 550 minutes and 469 minutes, respectively . Further, the RUC noted that the surveyed code requires more mental effort and judgment, more technical skill and physical effort to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 24.28 RVUs for 273X5, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 24.28 Work RVUs for 273X5.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
27615	P75	090	15.54	The RUC reviewed the survey data for CPT code 27615 Radical resection of tumor (eg, malignant neoplasm), soft tissue of leg or ankle area; less than 5 cm and compared it with its reference code 27880 Amputation, leg, through tibia and fibula; (Work RVU=15.24). The RUC noted that the surveyed code as compared to the reference code has more intra service time (120 minutes and 80 minutes, respectively) and very similar total service time (416 minutes and 400 minutes). Further, the RUC noted that the surveyed code overall is a slightly more intense procedure to perform than the reference code. In addition, the RUC compared the surveyed code to another reference code 41130 Glossectomy; hemiglossectomy (Work RVU=15.51). The RUC noted that the surveyed code and the reference code have similar total service times, 416 minutes and 407 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference codes, the RUC recommends 15.54 RVUs for 27615, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 15.54 Work RVUs for 27615.
2761X	P76	090	19.42	The RUC reviewed the survey data for CPT code 2761X Radical resection of tumor (eg, malignant neoplasm), soft tissue of leg or ankle area; 5 cm or greater and compared it with reference code 15734 Muscle, myocutaneous, or fasciocutaneous flap; trunk(Work RVU=19.62). The RUC noted that the surveyed code has less total service time as compared to the reference code, 463 minutes and 524 minutes, respectively. In addition, the RUC compared the surveyed code to MPC code 23395 Muscle transfer, any type, shoulder or upper arm; single (Work RVU=18.29). The RUC noted that the surveyed code as compared to the MPC code has more total service time, 463 minutes and 423 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 19.42 RVUs for 2761X, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 19.42 Work RVUs for 2761X.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
28046	P84	090	12.20	The RUC reviewed the survey data for CPT code 28046 Radical resection of tumor (eg, malignant neoplasm), soft tissue of foot or toe; less than 3 and compared it with its reference code 28299 Correction, hallux valgus (bunion), with or without sesamoidectomy; by double osteotomy (Work RVU=11.39). The RUC noted that the surveyed code has more total service time than the reference code, 334 minutes and 299 minutes respectively. Further, the RUC noted that the surveyed code requires more mental effort and judgment to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 12.20 RVUs for 28046, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 12.20 Work RVUs for 28046.
2804X	P85	090	17.24	The RUC reviewed the survey data for CPT code 2804X Radical resection of tumor (eg, malignant neoplasm), soft tissue of foot or toe; 3 cm or greater and compared it with its reference code 27447 Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty) (Work RVU=23.04). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code has less total service time as compared to the reference code, 413 minutes and 469 minutes, respectively. In addition, the RUC compared the surveyed code to MPC code 58150 Total abdominal hysterectomy (corpus and cervix), with or without removal of tube(s), with or without removal of ovary(s); (Work RVU=17.21). The RUC noted that the surveyed code as compared to the reference code has the same intra-service time, 120 minutes and similar total service times (413 minutes and 394 minutes). Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 17.24 RVUs for 2804X, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the radical codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the radical codes. The RUC recommends 17.24 Work RVUs for 2804X.

New Codes for Excision Recommendations

CPT Code #	*Tracking #*	*Global Period*	*RUC rec Work RVU*	*Rationale*
210X1	P1	090	2.91	The RUC reviewed the survey data for CPT code 210X1 Excision, tumor, soft tissue of face or scalp, subcutaneous; less than 2 cm and compared it with its reference code 11642 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter 1.1 to 2.0 cm (Work RVU=2.67). The RUC noted that although the surveyed code and reference code have very similar intensity and complexity measurements, the surveyed code as compared to the reference code had slightly more intra-service time (30 minutes and 25 minutes respectively and total service time (107 minutes and 68 minutes, respectively). The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 2.91 RVUs for 210X1, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. The RUC recommends 2.91 Work RVUs for 210X1.
210X2	P2	090	4.37	The RUC reviewed the survey data for CPT code 210X2 Excision, tumor, soft tissue of face or scalp, subcutaneous; 2 cm or greater and compared it with its reference code 11643 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter 2.1 to 3.0 cm (Work RVU=3.37). The RUC noted that the surveyed code as compared to the reference code had more intra-service time (45 minutes and 30 minutes respectively and total service time (148 minutes and 93 minutes, respectively). Further, the RUC noted that the surveyed code required more technical skill and physical effort to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 4.37 RVUs for 210X2, which is a value between the 25th percentile and the surveyed median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. The RUC recommends 4.37 Work RVUs for 210X2.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
210X3	P3	090	5.34	The RUC reviewed the survey data for CPT code 210X3 Excision, tumor, soft tissue of face and scalp, subfascial (eg, subgaleal, intramuscular); less than 2 cm and compared it with its reference code 38510 Biopsy or excision of lymph node(s); open, deep cervical node(s) (Work RVU=6.69). The RUC noted that although the surveyed code and the reference code have the same intra-service times (45 minutes), the reference code in comparison to the reference code requires, more mental effort and judgment and physical effort to perform than the surveyed code. Furthermore, the RUC compared the surveyed code to MPC code 33212 Insertion or replacement of pacemaker pulse generator only; single chamber, atrial or ventricular (Work RVU=5.51). The RUC noted that the MPC code has more intra service time in comparison to the surveyed code, 60 minutes and 45 minutes respectively. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the MPC code and the reference code, the RUC recommends 5.34 RVUs for 210X3, which is a value between the 25th percentile and survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. The RUC recommends 5.34 Work RVUs for 210X3.
210X4	P4	090	7.00	The RUC reviewed the survey data for CPT code 210X4 Excision, tumor, soft tissue of face and scalp, subfascial (eg, subgaleal, intramuscular); 2 cm or greater and compared it with its reference code 38510 Biopsy or excision of lymph node(s); open, deep cervical node(s) (Work RVU=6.69). The RUC noted that the surveyed code as compared to the reference code had more intra-service time (60 minutes and 45 minutes, respectively) and total service time (217 minutes and 152 minutes, respectively). Further, the RUC noted that the surveyed code required more technical skill and physical effort to perform than the reference code. The RUC also took into consideration that both of the reference codes have a 10-day global period compared with the surveyed code which has a 90-day global period. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 7.00 RVUs for 210X4, which is a value between the 25th percentile and survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. Furthermore, this value is also consistent with the recommendations for the subfascial family of codes. The RUC recommends 7.00 Work RVUs for 210X4.

570

CPT Code #	*Tracking #*	*Global Period*	*RUC rec Work RVU*	*Rationale*
219X2	P15	090	9.71	The RUC reviewed the survey data for CPT code 219X2 Excision, tumor, soft tissue of neck or anterior thorax, subfascial (eg, intramuscular); less than 5 cm and compared it with its reference code 15100 Split-thickness autograft, trunk, arms, legs; first 100 sq cm or less, or 1% of body area of infants and children (except 15050) (Work RVU=9.74). The RUC reviewed the survey data and agreed with the specialty society that a hospital visit and full day discharge visit were appropriate as the majority of survey respondents who stated that they typically perform this procedure in the hospital stated that the patient is kept overnight or admitted. The RUC noted that the surveyed code and the reference code have very similar total service times (276 minutes and 281 minutes, respectively) Further, the RUC noted that the surveyed code and the reference code have very similar intensity and complexity measurements. In addition, the RUC compared the surveyed code to another reference code 25115 Radical excision of bursa, synovia of wrist, or forearm tendon sheaths (eg, tenosynovitis, fungus, Tbc, or other granulomas, rheumatoid arthritis); flexors (Work RVU=9.89). The RUC noted that the reference code has more intra service time in comparison to the surveyed code, 90 minutes and 60 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference codes, the RUC recommends 9.71 RVUs for 219X2, which is a value between the 25th percentile and survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. The RUC recommends 9.71 Work RVUs for 219X2.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
219X3	P16	090	11.00	The RUC reviewed the survey data for CPT code 219X3 Excision, tumor, soft tissue of back or flank, subfascial (eg, intramuscular); 5cm or greater and compared it with its reference code 38745 Axillary lymphadenectomy; complete (Work RVU=13.71). The RUC reviewed the survey data and agreed with the specialty society that a hospital visit and full day discharge visit were appropriate as the majority of survey respondents who stated that they typically perform this procedure in the hospital stated that the patient is kept overnight or admitted. Further, the RUC noted that although the surveyed code has the same intra-service time as the reference code, 90 minutes, respectively, the RUC agreed that this was a poor reference code. Therefore, the RUC agreed that a better reference code and keeping consistent with other recommendations from the subfascial family of codes would be 27822 Open treatment of trimalleolar ankle fracture, includes internal fixation, when performed, medial and/or lateral malleolus; without fixation of posterior lip (Work RVU=11.03) as the surveyed code and 27822 reference code have the same intra-service time, 90 minutes and similar intensity of work. Due to these comparisons between the surveyed code and the 27822 reference code and to maintain relativity with the recommendations for the subfascial codes, the RUC recommends 11.00 RVUs, a value below the surveyed 25th percentile, for 219X3. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. Furthermore, this value is also consistent with the recommendations for the subfascial family of codes. The RUC recommends 11.00 Work RVUs for 219X3.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
229X0	P19	090	4.34	The RUC reviewed the survey data for CPT code 229X0 Excision, tumor, soft tissue of abdominal wall, subcutaneous; less than 3 cm and compared it with its reference code 38525 Biopsy or excision of lymph node(s); open, deep axillary node(s) (Work RVU=6.35). Although the surveyed code and the reference code have similar intensity and complexity measurements, the RUC noted that the surveyed code as compared to the reference code has less total service time (148 minutes and 178 minutes, respectively). In addition, the RUC compared the surveyed code to MPC code 11644 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter 3.1 to 4.0 cm (Work RVU=4.29). The RUC noted that the surveyed code had significantly more total service time in comparison to the MPC code, 148 minutes and 108 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the reference code and the MPC code, the RUC recommends 4.34 RVUs for 229X0, which is a value between the 25 percentile and the survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. The RUC recommends 4.34 Work RVUs for 229X0.
229X1	P20	090	6.31	The RUC reviewed the survey data for CPT code 229X1 Excision, tumor, soft tissue of abdominal wall, subcutaneous; 3 cm or greater and compared it with its reference code 38525 Biopsy or excision of lymph node(s); open, deep axillary node(s) (Work RVU=6.35). The RUC noted that the surveyed code and the reference code have very similar intra-service times (50 minutes and 45 minutes, respectively and total service times (179 minutes and 178 minutes, respectively) Further, the RUC noted that the surveyed code and the reference code have very similar intensity and complexity measurements. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 6.31 RVUs for 229X1, which is a value between the 25th percentile and survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. The RUC recommends 6.31 Work RVUs for 229X1.

CPT Code #	Tracking #	Global Period	RUC rec Work RVU	Rationale
229X3	P23	090	16.51	The RUC reviewed the survey data for CPT code 229X3 Radical resection of tumor (eg, malignant neoplasm), soft tissue of abdominal wall; less than 5 cm and compared it with its reference code 49203 Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, 1 or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less (Work RVU=20.00). Although the surveyed code has greater intensity and complexity measurements as compared to the reference code, the RUC noted that the surveyed code as compared to the reference code has less total service time (396 minutes and 420 minutes, respectively). In addition, the RUC compared the surveyed code to MPC code 19318 Reduction mammaplasty (Work RVU=15.91). The RUC noted that the surveyed code has more total service time than the reference code, 396 minutes and 321 minutes, respectively. Therefore, the RUC agreed that because of these comparisons between the surveyed code, the MPC code and the reference code, the RUC recommends 16.51 RVUs for 229X3, which is a value below the surveyed 25th percentile. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. The RUC recommends 16.51 Work RVUs for 229X3.
229X4	P24	090	21.37	The RUC reviewed the survey data for CPT code 229X4 Radical resection of tumor (eg, malignant neoplasm), soft tissue of abdominal wall; 5 cm or greater and compared it with its reference code 49203 Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, 1 or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less (Work RVU=20.00). The RUC noted that the surveyed code as compared to the reference code had more intra-service time (150 minutes and 120 minutes, respectively) and total service time (463 minutes and 420 minutes, respectively). Further, the RUC noted that the surveyed code required more mental effort and judgment, technical skill and physical effort to perform than the reference code. Therefore, the RUC agreed that because of these comparisons between the surveyed code and the reference code, the RUC recommends 21.37 RVUs for 229X4, which is a value between the 25th percentile and survey median. As described in the overall rationale, the RUC agreed that in order to preserve rank order with the recommendations for the subcutaneous codes, the recommendations for the new excision of soft tissue tumor codes should be reduced by 2.88% as well. The RUC recommended value for this procedure takes into account the 2.88% reduction applied to all of the new excision of soft tissue tumor codes. Furthermore, this value is also consistent with the recommendations for the subfascial family of codes. The RUC recommends 21.37 Work RVUs for 229X4.

Global Period: 090 RUC Recommended RVU: **3.88**

CPT Descriptor: Excision, tumor, soft tissue of neck or anterior thorax, subcutaneous; less than 3 cm

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old male undergoes excision of a 2.5 cm lipoma on his neck.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Percent of survey respondents who stated they perform the procedure; In the hospital 82% , In the ASC 0%, In the office 18%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning and adjusting the OR table and MAC lines so that the operative site is assessable. Clip hair from surgical site. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, an incision is made through the skin and subcutaneous tissue of the neck overlying the mass. The tumor is identified and dissected free along the tumor capsule, taking care not to traumatize surrounding structures. The tumor is removed and sent for permanent pathologic evaluation. The wound is inspected and irrigated. After assuring complete hemostasis, the wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied to the neck. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery ıtcome with patient. Dictate operative report and complete medical record documentation. Communicate with other ,rofessionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write orders for home medications. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one week

and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Time Segments (Mean)

Pre-Service intensity/complexity	2.40	2.00
Intra-Service intensity/complexity	2.20	2.00
Post-Service intensity/complexity	1.90	1.90

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 21555 (Excision tumor, soft tissue of neck or thorax; subcutaneous) will be deleted in 2010 and replaced by two new codes (P7 and P8).

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: No change.

- Positioning: Add 5 minutes – after induction of anesthesia in supine position, adjusting the OR table and MAC lines so that the operative site is assessable. Clip hair from surgical site
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 3.88 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.027. The recommended RVW for this 90-day global code is greater than the reference code which is an office-based procedure with a 10-day global period and one post-op office visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21555

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 21555 (Excision tumor, soft tissue of neck or thorax; subcutaneous) will be deleted in 2010 and replaced by two new codes (P7 and P8).

Pre-Time: With respect to the pre-service time, we recommend package 3 with no changes.

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 6.41 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.049. The recommended RVW is similar to the reference code 38510 which has a 10-day global period, only one post-op office visit, and less intra-op time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21555

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:21930 Tracking Number P13 Specialty Society Recommended RVU: **4.86**

Global Period: 090 RUC Recommended RVU: **4.86**

CPT Descriptor: Excision, tumor, soft tissue of back or flank, subcutaneous; less than 3 cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old female undergoes excision of a 2.5 cm spongy tumor on her back.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Percent of survey respondents who stated they perform the procedure; In the hospital 90% , In the ASC 0%, In the office 10%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 95% , Kept overnight (less than 24 hours) 5% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 50%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Local anesthesia is infiltrated into the marked incision site as preemptive analgesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue over the lesion. Subcutaneous flaps are raised with electrocautery and hemostasis is controlled. The tumor is excised along with proper margin of tissue. Hemostasis is secured with electrocautery and sutures where needed. Small lymphatic channels are ligated. The wound is inspected and irrigated. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain

medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one week and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Order medications necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary.. Discuss progı with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 21930 (Excision, tumor, soft tissue of back or flank) will be deleted in 2010 and replaced by four new codes (P13, P14, P15, and P16). During the Harvard study, 12 general surgeons were surveyed only for intra-operative time. Pre and post times were predicted. This prediction resulted in no positioning time, no facility post-work (even though the code is typically performed in a facility), and one office visit (even though the procedure will typically require at least two office visits during the 90-day global period). The prediction also placed the details for

this code similar to the smallest subcutaneous excision details per the current survey (P13). The time and visit information for 21930 does not represent larger and/or deeper tumors. Further, without requiring a RUC survey in 1995 during the first 5-year-review, the code was reduced based on a comment letter.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 4.86 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.036. This is similar to the IWPUT for the reference code 11606, which has similar total time, but is an office-based procedure with a 10-day global period.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 21930 (Excision, tumor, soft tissue of back or flank) will be deleted in 2010 and replaced by four new codes (P13, P14, P15, and P16). During the Harvard study, 12 general surgeons were surveyed only for intra-operative time. Pre and post times were predicted. This prediction resulted in no positioning time, no facility post-work (even though the code is typically performed in a facility), and one office visit (even though the procedure will typically require at least two office visits during the 90-day global period). The prediction also placed the details for

this code similar to the smallest subcutaneous excision details per the current survey (P13). The time and visit information for 21930 does not represent larger and/or deeper tumors. Further, without requiring a RUC survey in 1995 during the first 5-year-review, the code was reduced based on a comment letter.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 6.80 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.051. This is similar to the IWPUT for the reference code 38525, which has less intra-operative time and less total time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 97% , In the ASC 0%, In the office 3%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 97% , Kept overnight (less than 24 hours) 3% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with lateral beach chair positioning, exposing the shoulder and stabilizing the patient's torso. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 4 cm incision is made in the skin and subcutaneous tissue over the shoulder. Medial and lateral flaps are made. Careful dissection is carried around the tumor. The tumor is excised and sent to pathology. Hemostasis is obtained. The wound is inspected and irrigated. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate

medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Revise treatm plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 23075 (Excision, soft tissue tumor, shoulder area; subcutaneous) will be deleted in 2010 and replaced by two new codes (P25 and P26). During the Harvard study, 13 orthopaedic surgeons were surveyed only for intra-operative time. General surgery, the primary provider of this service, was not involved. Additionally, the global period designated was 10-days. This was different than any other soft tissue code reviewed.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, the patient will be repositioned beach chair and slightly lateral to expose the shoulder and stabilizing the patient's torso.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 4.13 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.035. This is similar to the IWPUT for the reference code 11406, which has similar total time, but is an office based procedure with a 10-day global period.

medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 23075 (Excision, soft tissue tumor, shoulder area; subcutaneous) will be deleted in 2010 and replaced by two new codes (P25 and P26). During the Harvard study, 13 orthopaedic surgeons were surveyed only for intra-operative time. General surgery, the primary provider of this service, was not involved. Additionally, the global period designated was 10-days. This was different than any other soft tissue code reviewed.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 5.83 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.046. This RVW is similar to the reference code 20680, which has a 90-day global period and similar total time and total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23075

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old female undergoes excision of a 2 cm tumor from the anterior aspect of the distal right arm.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 98% , In the ASC 0%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 95% , Kept overnight (less than 24 hours) 5% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 50%

's moderate sedation inherent to this procedure in the Hospital/ASC setting? No
ercent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Exsanguinate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 4cm incision is made in the skin and subcutaneous tissue over the tumor. Careful dissection is carried around the tumor. The tumor is excised and sent to pathology. The tourniquet is deflated and any bleeders are cauterized. The wound is inspected and irrigated. The wound is closed in two layers with interrupted sutures.

escription of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take pecimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider

relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	1.91	1.64

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 24075 (Excision, tumor, soft tissue of upper arm or elbow area; subcutaneous) will be deleted in 2010 and replaced by two new codes (P34 and P35). During the Harvard study, 13 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 4.16 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.036. This is slightly more than the IWPUT for the reference code 11406, which is an office-based procedure with a 10-day global period.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

The wound is closed in two layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Ta' specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist , coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider

relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational or physical therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Pre-Service intensity/complexity	2.50	2.13
Intra-Service intensity/complexity	2.38	2.00
Post-Service intensity/complexity	2.25	1.88

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 24075 (Excision, tumor, soft tissue of upper arm or elbow area; subcutaneous) will be deleted in 2010 and replaced by two new codes (P34 and P35). During the Harvard study, 13 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 5.62 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.045. This is similar to the IWPUT for the reference code 20680, which has similar intra and total time and reflects similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 24075

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the tumor. Careful dissection is carried down to the tumor taking care to protect any neurovascular structures. The tumor is dissected away from the adjacent tissues and removed. The wound is irrigated. The tourniquet is released and meticulous hemostasis is achieved. The wound is again irrigated. The wound is closed in layers.

escription of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take ecimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider

relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 25075 (Excision, tumor, soft tissue of forearm and/or wrist area; subcutaneous) will be deleted in 2010 and replaced by two new codes (P42 and P43). During the Harvard study, 12 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 3.88 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.031. This is similar to the IWPUT for the reference code 11406, which is an office-based procedure with a 10-day global period.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made over the tumor. Careful dissection is carried down to the tumor taking care to protect any neurovascular structures. The tumor is dissected away from the adjacent tissues and removed. Cultures are taken. The wound is irrigated. The tourniquet is released and meticulous hemostasis is achieved. The wound is again irrigated. The wound is closed in layers.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Tal specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist ι coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider

relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	1.50	1.50

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 25075 (Excision, tumor, soft tissue of forearm and/or wrist area; subcutaneous) will be deleted in 2010 and replaced by two new codes (P42 and P43). During the Harvard study, 12 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 5.83 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.052. This is similar to the IWPUT for the reference code 20680, which has similar intra and total time and reflects similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 25075

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A Brunner incision is made over the tumor. Careful dissection of the tumor is carried out. The digital arteries and nerves are identified and carefully protected. The flexor tendon sheath is identified and protected. The tumor is meticulously dissected from the adjacent tissues. The wound is inspected for any residual tumor. The wound is irrigated. The tourniquet is released and meticulous hemostasis is achieved using a bipolar electrocautery. The skin is then closed.

Description of Post-Service Work: Apply soft protective dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report

and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Intra-Service intensity/complexity	2.30	2.50
Post-Service intensity/complexity	2.00	2.20

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 26115 (Excision, tumor or vascular malformation, soft tissue of hand or finger; subcutaneous) will be deleted in 2010 and replaced by two new codes (P49 and P50). During the Harvard study, 14 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. No positioning time and no facility post-work were recorded (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The median RVWs is inconsistent with the intensity of this procedure. The 25th percentile RVW results in an IWPUT of zero. The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 3.88 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. This is the same RVW recommendation for five other small subcutaneous tumor excision codes that have the same intra-time and total time. Along with the recommended time and visit information, this results in an IWPUT of 0.031. This RVW is correctly less than the reference code 20680.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Descriptor: Excision, tumor or vascular malformation, soft tissue of hand or finger, subcutaneous; 1.5 cm or greater

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male undergoes excision of a 2 cm tumor from the palmar aspect of the index finger.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 86% , In the ASC 0%, In the office 14%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 96% , Kept overnight (less than 24 hours) 2% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning supine, with hand positioned on hand table and anesthesia staff and lines clear of operative site. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on arm, prep the arm, scrub and gown. Drape the arm. Elevate the arm and inflate the pneumatic tourniquet. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A Brunner incision is made over the tumor. Careful dissection of the tumor is carried out. The digital arteries and nerves are identified and carefully protected. The flexor tendon sheath is identified and protected. The tumor is meticulously dissected from the adjacent tissues. The wound is inspected for any residual tumor. The wound is irrigated. The tourniquet is released and meticulous hemostasis is achieved using a bipolar electrocautery. The skin is then closed.

Description of Post-Service Work: Apply soft protective dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room and neurovascular

status of the operated extremity. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one or two days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, assess neurovascular status and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order occupational therapy and assess functional recovery. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Post-Service intensity/complexity	1.73	1.73

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 26115 (Excision, tumor or vascular malformation, soft tissue of hand or finger; subcutaneous) will be deleted in 2010 and replaced by two new codes (P49 and P50). During the Harvard study, 14 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. No positioning time and no facility post-work were recorded (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, a hand table will be attached to the OR table. The hand is positioned on the arm table, anesthesia staff and lines will be adjusted for a clear operative site, and a tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 5.34 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.047. This RVW is similar to the reference code 20680. The time, visits, intensity and work for both codes are very similar.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Local anesthesia is infiltrated into the marked incision site as preemptive analgesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue over the lesion. Subcutaneous flaps are raised with electrocautery and hemostasis is controlled. The tumor is excised along with proper margin of tissue. Hemostasis is secured with electrocautery and sutures where needed. Small lymphatic channels are ligated. The wound is inspected and irrigated. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain

medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one week and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Reconc medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Disc progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 27047 (Excision, tumor, pelvis and hip area; subcutaneous tissue) will be deleted in 2010 and replaced by two new codes (P58 and P59). During the Harvard study, 8 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted.

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 17 minutes to account for lateral positioning.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 4.86 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.040. This is similar to the IWPUT for the reference code 46040, which has less intra-time, but more total work.

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27043 Tracking Number P59 Specialty Society Recommended RVU: **6.80**

Global Period: 090 RUC Recommended RVU: **6.80**

CPT Descriptor: Excision, tumor, soft tissue of pelvis and hip area, subcutaneous; 3 cm or greater

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42-year-old female undergoes excision of a 5 cm tumor in her lateral buttock.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 86% , Kept overnight (less than 24 hours) 14% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 60%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient lateral positioning. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Local anesthesia is infiltrated into the marked incision site as preemptive analgesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue over the lesion. Subcutaneous flaps are raised with electrocautery to expose the lesion and hemostasis is controlled. The tumor is excised along with proper margin of tissue. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. Hemostasis is secured with electrocautery and sutures where needed. The wound is inspected and irrigated. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Wri brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare

professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one week and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Intra-Service intensity/complexity	3.38	3.00
Post-Service intensity/complexity	2.88	3.00

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 27047 (Excision, tumor, pelvis and hip area; subcutaneous tissue) will be deleted in 2010 and replaced by two new codes (P58 and P59). During the Harvard study, 8 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes to account for lateral positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 6.80 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.051. This is similar to the IWPUT for the reference code 38525, which has less intra-time and less total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27047

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Assist with patient positioning in a supine and slightly lateral position, with the leg bumped up 30 degrees and stabilized. Indicate areas of skin to be prepped and mark surgical incisions. Prep and drape leg. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 4cm incision is made in the skin and subcutaneous tissue over the tumor on the lateral thigh. Careful dissection is performed around the subcutaneous mass. The 2 cm mass is removed from the surrounding tissue. The tumor is handed off of the field. Hemostasis is obtained. The wound is inspected and irrigated. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are

completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one week and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Revise treatment plan(s) and communicate with patient and family/caregiv as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 27327 (Excision, tumor, thigh or knee area; subcutaneous) will be deleted in 2010 and replaced by two new codes (P68 and P69). During the Harvard study, 10 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes – move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 7 minutes. After induction of anesthesia in supine position, patient will be adjusted slightly lateral, with the leg bumped up 30 degrees and stabilized and padding of opposite extremity.
- Scrub/Dress/Wait: Add 5 minutes – moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 3.88 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. This is less than the current RVW for 27327. Along with the recommended time and visit information, this results in an IWPUT of 0.028. This is less than the IWPUT for the reference code 11622, which has less intra-time, one office visit and has a 10-day global period.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27337 Tracking Number P69 Specialty Society Recommended RVU: **5.83**

Global Period: 090 RUC Recommended RVU: **5.83**

CPT Descriptor: Excision, tumor, soft tissue of thigh or knee area, subcutaneous; 3 cm or greater

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female undergoes excision of a 5 cm tumor in her medial anterior thigh.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 74% , Kept overnight (less than 24 hours) 24% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 91%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. Assist with patient positioning in a supine position, with the leg bumped up 30 degrees and stabilized. Indicate areas of skin to be prepped and mark surgical incisions. Prep and drape leg. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A sterile tourniquet is applied and inflated. Under anesthesia, a 7 cm incision is made in the skin and subcutaneous tissue over the anteromedial thigh. Medial and lateral flaps are raised and careful dissection is performed around the 5 cm tumor. The tumor is removed. Hemostasis is obtained. The wound is inspected and irrigated. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. Assess neurovascular statu Wound care and close observation are important to avoid or promptly treat compartment syndrome. After patient . awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain

medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one week and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures and drain; and discuss pathology report when available. Order and eview periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 27327 (Excision, tumor, thigh or knee area; subcutaneous) will be deleted in 2010 and replaced by two new codes (P68 and P69). During the Harvard study, 10 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, was not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 7 minutes. After induction of anesthesia in supine position, patient will be adjusted slightly lateral, with the leg bumped up 30 degrees and stabilized and padding of opposite extremity.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 5.83 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.051. This is the same as the IWPUT for the reference code 20680. Pre, intra, and post work for both procedures is very similar.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 27618 (Excision, tumor, leg or ankle area; subcutaneous tissue) will be deleted in 2010 and replaced by two new codes (P77 and P78). During the Harvard study, 9 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, and podiatry were not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: Subtract 5 minutes - move to scrub/dress wait category for moderate sedation performed by anesthesiologist.
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, patient is adjusted slightly later, with the leg bumped up 30 degrees and stabilized with padding of opposite extremity. Tourniquet is applied.
- Scrub/Dress/Wait: Add 5 minutes - moved from evaluation category for moderate sedation performed by anesthesiologist.

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 3.88 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.031. This is similar to the IWPUT for the reference code 11406, which is an office-based 10-day global procedure with one office visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:27632 Tracking Number P78 Specialty Society Recommended RVU: **5.83**

Global Period: 090 RUC Recommended RVU: **5.83**

CPT Descriptor: Excision, tumor, soft tissue of leg or ankle area, subcutaneous; 3 cm or greater

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male undergoes excision of a 3.5 cm tumor in the medial calf.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 94% , In the ASC 0%, In the office 6%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 93% , Kept overnight (less than 24 hours) 7% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 67%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Assist with patient positioning in a supine and slightly lateral position, with the leg bumped up 30 degrees and stabilized. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet on the proximal thigh. Prep and drape leg. Elevate and exsanguinate leg. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a 6 cm incision is made in the skin and subcutaneous tissue over the tumor on the leg. Careful dissection around the tumor is performed. The tumor is excised en bloc. The wound is inspected and irrigated. The tourniquet is deflated and any bleeders are cauterized. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings and splint. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's famil Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and appropriate use of crutches or walker. Reconcile

medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within one to two days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures and drain; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Intra-Service intensity/complexity	2.00	1.71
Post-Service intensity/complexity	1.57	1.25

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 27618 (Excision, tumor, leg or ankle area; subcutaneous tissue) will be deleted in 2010 and replaced by two new codes (P77 and P78). During the Harvard study, 9 orthopaedic surgeons were surveyed. General surgery, the primary provider of this service, and podiatry were not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 9 minutes. After induction of anesthesia in supine position, patient is adjusted slightly lateral, with the leg bumped up 30 degrees and stabilized with padding of opposite extremity. Tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey 25th percentile RVW *adjusted* down to 5.83 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.050. This is similar to the IWPUT for the reference code 20680, a procedure that has essentially the same total work as the survey code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 28043 (Excision, tumor, foot; subcutaneous tissue) will be deleted in 2010 and replaced by two new codes (P86 and P87). During the Harvard study, 10 orthopaedic surgeons were surveyed. Podiatry, the primary and significant provider of this service, was not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: No change. The 5 minutes allocated for moderate sedation by an anesthesiologist is replaced by 5 minutes for the surgeon to perform a regional block.
- Positioning: Add 5 minutes. Patient's leg is elevated and foot is stabilized. Opposite extremity is padded. Tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 3.88 to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.028. This is less than the IWPUT for the reference code 11422, a procedure that is office based, has one post-op visit and has a 10-day global period.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:28039 Tracking Number P87 Specialty Society Recommended RVU: **5.34**

Global Period: 090 RUC Recommended RVU: **5.34**

CPT Descriptor: Excision, tumor, soft tissue of foot or toe, subcutaneous; 1.5 cm or greater

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female undergoes excision of a 2.0 cm fibrous tumor in the subcutaneous tissue of the right foot.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Percent of survey respondents who stated they perform the procedure; In the hospital 85% , In the ASC 0%, In the office 15%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Verify that all required instruments and supplies are available. Assist with patient supine positioning and padding to stabilize foot. Perform regional block. Indicate areas of skin to be prepped and mark surgical incisions. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: An incision is made on the plantar aspect of the first intermetatarsal space. Dissection is carried out to reveal a fibrous lesion. The lesion is dissected from surrounding tissue, and all bleeders are cauterized. The lesion is delivered from the wound. The wound site is irrigated and inspected. The wound is closed in layers with simple interrupted sutures and the skin is coapted with a running mattress of nylon. The tourniquet is deflated, and normal capillary return is seen in the toes.

Description of Post-Service Work: Apply sterile dressing and splint/shoe. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist to coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing) and use of crutches or walker. Reconcile medications

and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a few days and for at least one more visit through the 90-day global period to remove dressings, assess wound healing, and redress wound; remove sutures; and discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Pre-Service intensity/complexity	2.38	2.50
Intra-Service intensity/complexity	2.50	2.75
Post-Service intensity/complexity	2.00	2.38

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Current code 28043 (Excision, tumor, foot; subcutaneous tissue) will be deleted in 2010 and replaced by two new codes (P86 and P87). During the Harvard study, 10 orthopaedic surgeons were surveyed. Podiatry, the primary and significant provider of this service, was not involved. Pre and post times were predicted. This prediction resulted in no positioning time and no facility post-work (even though the code is typically performed in a facility).

Pre-Time: With respect to the pre-service time, we recommend package 1B with the following modifications:

- Evaluation: No change. The 5 minutes allocated for moderate sedation by an anesthesiologist is replaced by 5 minutes for the surgeon to perform a regional block.
- Positioning: Add 5 minutes. Patient's leg is elevated and foot is stabilized. Opposite extremity is padded. Tourniquet is applied.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends an RVW that is the same as P50 to place this subcutaneous code in correct rank order with the rest of the family of subcutaneous codes. Additionally, this value has been *adjusted* (decreased) to 5.34 RVWs to accomplish work neutrality in the family of subcutaneous soft tissue tumor codes. Along with the recommended time and visit information, this results in an IWPUT of 0.054. This is similar to the IWPUT for the reference code 28289. The RVW is less than the reference code, accounting for less office visits.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of anticoagulation meds. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning and adjusting the OR table and anesthesia lines so that the operative site is assessable. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a longitudinal incision is made over the posterior-cervical triangle. The platysma is identified and split with the major portion retracted anteriorly. The posterior portion of the sternocleidomastoid and the interval between the sternocleidomastoid and the anterior trapezius is identified. Within that interval, great care is necessary to avoid injuring the spinal accessory nerve root which innervates the muscles. Dissection is carried deep between those two muscles. Sensory branches of the cervical nerves to the skin cross the posterior portion of the sternocleidomastoid muscle and are protected. The branch of the transverse cervical artery in the inferior portion of the wound has to be ligated and incised. The carotid sheath and jugular vein can be palpated anteriorly in the incision and are carefully retracted out of the field. Several perforating vessels off the jugular vein are also ligated and incised. As the interval is further explored, the mass is palpable deep within the wound. At this point, in the inferior portion of the incision, the omo-hyoid muscle is identified posteriorly, the levator scapula and the middle scalene muscles are identified in the proximal wound, and the anterior scalene identified in the proximal anterior wound.

The mass itself is sitting directly between them and has spread them apart. The mass is then identified and appears to be consistent with the MRI which showed homogenous mass consistent with a lipoma. Since it is a lipoma, a marginal resection will be performed. The mass is peeled off the anterior scalene muscle and the omo-hyoid and gradually retracted off the anterior portion of the wound. This is freed up from the back of the carotid sheath and the jugular ve

Several small feeding vessels into the lipoma are ligated and incised. Inferior in the wound, the brachial plexus can palpated deep in the interval between the anterior and middle scalene. It is directly underneath and adherent to the underside of the lipoma. Very carefully the nerve roots are retracted and the lipoma is carefully dissected off the major trunks of the brachial plexus in the bottom of the wound. Next to the brachial plexus, the take off of the subclavian artery and vein can be seen. Several small perforating branches can be seen there and these are retracted out of the way as well as the suprascapular artery coming off the base of the thyro-cervical trunk. Once that area is identified, the rest of the lipoma is gently dissected off the brachial plexus and is removed in block. Since it is lipoma, frozen sections are not performed on the margins. The mass is handed off the field. The gloves and instruments are changed and the wound is copiously irrigated. Hemostasis is obtained. The top of the brachial plexus is inspected to make sure that there is no damage to any of the major nerve trunks. The spinal accessory nerve proximally in the wound can be seen as it goes underneath the sternocleidomastoid and trapezius and that is also inspected to make sure there is no injury. A drain is placed with great care to make sure it's not on either the subclavian vessels or carotid sheath. This is brought out posteriorly. The posterior triangle also has several lymph nodes in the area and the lymph chain here had to be carefully protected since in a lipoma there is no need to remove the lymph nodes. The muscles are allowed to retract back into their original location. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied to the neck. A cervical collar is applied to help control head rotation. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including a recheck of hematocrit. The patient will be put on an oxygen monitor since with neck surgery any hematoma could put pressure on the trachea. After patient is awake, discuss surgery outcome with patient. Dictate operative report and complete medical record documentation. Communicate with other professionals and with patient and patient's family. Exami patient, assessing hemodynamic status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Consider relevant data, options, and risks and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drain when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Intra-Service intensity/complexity	2.86	3.07
Post-Service intensity/complexity	2.07	2.07

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21556 (Excision tumor, soft tissue of neck or thorax; deep, subfascial, intramuscular) will be deleted in 2010 and replaced by two new codes (P9 and P10). During the Harvard study, 10 general surgeons were surveyed. Otolaryngology was not involved. Pre and post times were predicted. No positioning work was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with the following modifications:

- Evaluation: no change
- Positioning: Add 17 minutes for prone positioning.
- Scrub/Dress/Wait: no change

Recommendation: The consensus committee recommends the survey median RVW *adjusted* down to 7.53 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.045. This RVW is greater than the reference code 38510 which has a 10-day global period, one post-op office visit, and less intra-op time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21556

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

SUMMARY OF RECOMMENDATION

CPT Code:21554 Tracking Number P10 Specialty Society Recommended RVU: **12.47**

Global Period: 090 RUC Recommended RVU: **11.00**

CPT Descriptor: Excision, tumor, soft tissue of neck or anterior thorax, subfascial (eg, intramuscular); 5 cm or greater

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male undergoes excision of a 9 cm tumor deep in the posterior-lateral para-spinal region of the neck behind the sternocleidomastoid.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 11% , Kept overnight (less than 24 hours) 61% , Admitted (more than 24 hours) 29%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 94%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs and imaging studies with special attention to review of x-ray, CT, MRI, MRA, as well as consulting with radiology. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Assure appropriate selection, timing, and administration of anticoagulation meds. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with patient prone positioning and adjusting the OR table and anesthesia lines so that the operative site is assessable. Assess position of the extremities and head, adjust as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a longitudinal incision is made over the posterior-cervical triangle. The platysma is identified and split with the major portion retracted anteriorly. The posterior portion of the sternocleidomastoid and the interval between the sternocleidomastoid and the anterior trapezius is identified. Within that interval, great care is necessary to avoid injuring the spinal accessory nerve root which innervates the muscles. Dissection is carried deep between those two muscles. Sensory branches of the cervical nerves to the skin cross the posterior portion of the sternocleidomastoid muscle and are protected. The branch of the transverse cervical artery the inferior portion of the wound has to be ligated and incised. The carotid sheath and jugular vein can be palpated anteriorly in the incision and are carefully retracted out of the field. Several perforating vessels off the jugular vein are also ligated and incised. As the interval is further explored, the mass is palpable deep within the wound. At this point, in the inferior portion of the incision, the omo-hyoid muscle is identified posteriorly, the levator scapula and the middle scalene muscles are identified in the proximal wound, and the anterior scalene identified in the proximal anterior wound.

The mass itself is sitting directly between them and has spread them apart. The mass is then identified and appears to be consistent with the MRI which showed homogenous mass consistent with a lipoma. Since it is a lipoma, a marginal resection will be performed. The mass is peeled off the anterior scalene muscle and the omo-hyoid and gradually retracted off the anterior portion of the wound. This is freed up from the back of the carotid sheath and the jugular vein. Several small feeding vessels into the lipoma are ligated and incised. Inferior in the wound, the brachial plexus can be palpated deep in the interval between the anterior and middle scalene. It is directly underneath and adherent to the underside of the lipoma. Very carefully the nerve roots are retracted and the lipoma is carefully dissected off the major trunks of the brachial plexus in the bottom of the wound. Next to the brachial plexus, the take off of the subclavian artery and vein can be seen. Several small perforating branches can be seen there and these are retracted out of the way as well as the suprascapular artery coming off the base of the thyro-cervical trunk. Once that area is identified, the rest of the lipoma is gently dissected off the brachial plexus and is removed in block. Since it is lipoma, frozen sections are not performed on the margins. The mass is handed off the field. The gloves and instruments are changed and the wound is copiously irrigated. Hemostasis is obtained. The top of the brachial plexus is inspected to make sure that there is no damage to any of the major nerve trunks. The spinal accessory nerve proximally in the wound can be seen as it goes underneath the sternocleidomastoid and trapezius and that is also inspected to make sure there is no injury. A drain is placed with great care to make sure it's not on either the subclavian vessels or carotid sheath. This is brought out posteriorly. The posterior triangle also has several lymph nodes in the area and the lymph chain here had to be carefully protected since in a lipoma there is no need to remove the lymph nodes. The muscles are allowed to retract back into their original location. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Steri-strips and a compression dressing are applied to the neck. A cervical collar is applied to help control head rotation. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room, including a recheck of hematocrit. The patient will be put on an oxygen monitor since with neck surgery any hematoma could put pressure on the trachea. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Perform an expanded problem focused exam, assessing hemodynamic status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine and talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office the next day and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures and drains when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Assess functional recovery and determine whether there is a need for physical therapy. Reconcile medication(s). Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 21556 (Excision tumor, soft tissue of neck or thorax; deep, subfascial, intramuscular) will be deleted in 2010 and replaced by two new codes (P9 and P10). During the Harvard study, 10 general surgeons were surveyed. Otolaryngology was not involved. Pre and post times were predicted. No positioning work was recorded.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 4 with the following modifications:

- Evaluation: No change.
- Positioning: Add 17 minutes for prone positioning.
- Scrub/Dress/Wait: No change

Recommendation: This patient will typically require a drain and will stay overnight in the hospital for monitoring. The surgeon will examine the patient later on the day of the procedure. The consensus committee recommends the survey median RVW *adjusted* down to 12.47 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey median has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.066. This RVW is similar to the reference code 38700 which requires similar intra-op time and work and similar total work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

.. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Local anesthesia is infiltrated into the marked incision site as preemptive analgesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue over the lesion. Subcutaneous flaps are raised with electrocautery. The external oblique muscle is exposed around the tumor. The tumor is excised along with surrounding muscle using electrocautery and dissection. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. Hemostasis is secured with electrocautery and sutures where needed. The wound is inspected and irrigated. Devitalized muscle is debrided. Where possible, the muscle fascial defect is approximated. A Penrose drain is placed in the cavitary defect. The wound is closed in layers with interrupted sutures.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Take specimen to pathology, along with the appropriate history and information. The MRI is also shown to the pathologist so they can coordinate orientation of the specimen and location. Discuss surgery outcome with patient's family. Write brief operative note and medication orders. Monitor patient stabilization in the recovery room. After patient is awake, discuss surgery outcome with patient. Write orders for transferring to surgical floor and discuss ongoing care with floor nurses. Dictate operative report and complete medical record documentation. Later on the day of surgery, review

medical records and interval data charted. Communicate with other professionals and with patient and patient's family. Exam patient, assessing neurovascular status and drain. Wound care and close observation are important to avoid or promptly treat wound hematoma. Order and review imaging as necessary. Consider relevant data, options, and risks and revise treatment plan as necessary. The next day, review medical records and interval data charted. Examine talk with patient. Take down dressings, asses wound and patient status, and make the decision for discharge. Disc. aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and write order for pain medication. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms. The patient will be examined in the office within a week and for several more visits through the 90-day global period. Remove dressings, assess wound healing, and redress wound. Remove sutures when appropriate. Discuss pathology report when available. Order and review periodic lab and/or imaging, as necessary. Order physical therapy and assess functional recovery. Order medications as necessary. Revise treatment plan(s) and communicate with patient and family/caregiver, as necessary. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
49505	090	7.88	RUC Time

CPT Descriptor Repair initial inguinal hernia, age 5 years or older; reducible

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 1

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 9 **% of respondents:** 26.4 %

TIME ESTIMATES (Median)

	CPT Code: 22900	Key Reference CPT Code: 49505	Source of Time RUC Time
Median Pre-Service Time	51.00	50.00	
Median Intra-Service Time	60.00	70.00	
Median Immediate Post-service Time	20.00	20.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	20.0	0.00	
Median Discharge Day Management Time	38.0	19.00	
Median Office Visit Time	55.0	39.00	
Prolonged Services Time	0.0	0.00	
Median Total Time	**244.00**	**198.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)

Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.00	2.78
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.78	2.44
Urgency of medical decision making	2.89	2.56
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.22	3.00
Physical effort required	2.89	2.67
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.78	2.44
Outcome depends on the skill and judgment of physician	3.22	2.89
Estimated risk of malpractice suit with poor outcome	2.78	2.89

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.89	2.67
Intra-Service intensity/complexity	2.89	2.78
Post-Service intensity/complexity	2.56	2.33

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Compelling Evidence [Please see our cover letter for the overall Harvard and RUC history and compelling evidence arguments for all of the soft tissue tumor codes]:

1. Evidence that incorrect assumptions were made in the previous valuation of the service.

Current code 22900 (Excision, abdominal wall tumor, subfascial (eg, desmoid)) will be deleted in 2010 and replaced by two new codes (P21 and P22). During the Harvard study, 14 general surgeons were surveyed. The data that included hospital work was truncated by the RUC based on Medicare frequency. The typical patient is not Medicare-age and these patients will typically require a drain and will stay overnight in the hospital for monitoring. Further, without requiring a RUC survey in 1995 during the first 5-year-review, the code was reduced based on a comment letter.

2. Evidence that technology has changed physician work (i.e., diffusion of technology).
Over the past ten years, significant advancement has been made in the treatment of soft tissue tumors. Imaging advances have allowed for much more precise understanding of anatomic location and extent of tissue involvement. The work associated with soft tissue resection procedures has increased as the magnitude of what is possible has increased dramatically. These procedures are more technically demanding, prolonged, and involve more risk. The excision of deep benign masses (egg, desmoid tumors, hemangiomas, infiltrating lipomas and neural tumors) has also advanced in light of superior imaging and adjuvant treatments such as embolization, low dose chemotherapy, etc.

Pre-Time: With respect to the pre-service time, we recommend package 3 with no changes

Recommendation: The consensus committee recommends an RVW that is midway between the survey 25th percentile and median to place this code in correct rank order with the rest of the family of subfacial codes. Additionally, this value has been *adjusted* (decreased) to 8.21 to maintain the survey-based relativity in relation to the subcutaneous codes which are being presented as work neutral (the survey statistic has been reduced by 2.88%). Along with the recommended time and visit information, this results in an IWPUT of 0.050. The RVW is greater than the reference code 49505, which has less post-op work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22900

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Excel File for all soft tissue tumor codes will be provided. How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty.
Please explain the rationale for this estimate. National frequency is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. Excel File for all soft tissue tumor codes will be provided.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? Yes

If no, please select another crosswalk and provide a brief rationale.

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:22901 Tracking Number P22 Specialty Society Recommended RVU: **11.65**

Global Period: 090 RUC Recommended RVU: **10.00**

CPT Descriptor: Excision, tumor, soft tissue of abdominal wall, subfascial (eg, intramuscular); 5 cm or greater

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old female undergoes excision of a 9 cm lipoma of the external oblique muscle.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 6% , Kept overnight (less than 24 hours) 71% , Admitted (more than 24 hours) 24%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 79%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: Review labs, pathology reports and imaging studies with special attention to review of x-ray, CT, MRI, MRA. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic and anticoagulation. Verify that all required instruments and supplies are available. Patient is placed in supine position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team. Local anesthesia is infiltrated into the marked incision site as preemptive analgesia.

Description of Intra-Service Work: An incision is made through the skin and subcutaneous tissue over the lesion. Subcutaneous flaps are raised with electrocautery. The musculature is exposed around the tumor. The fascia is incised and part of it is included with the specimen in the dissection for proper margins. The tumor is excised along with surrounding muscle using electrocautery and dissection. As the tumor is lifted out of the wound, small lymphatics and feeding blood vessels are ligated. The deep fascia is inspected for involvement by the tumor as are the ribs and intercostal muscles. If deep margins involved then resection to the periosteum of the ribs and /or peritoneum is carried out. Hemostasis is secured with electrocautery and sutures where needed. The wound is inspected and irrigated Devitalized muscle is debrided. Where possible, the muscle fascial defect is approximated. A Penrose drain is placed the cavitary defect. The wound is closed in layers with interrupted sutures.
