Preventing physician suicide

We must be vigilant for signs of burnout and depression within ourselves and among our colleagues, and we must not hesitate to seek help when we recognize something is amiss. Physicians have resilience and self-reliance in abundance, but when we rely on those traits above all others, we put our own well-being and that of our patients and colleagues at risk.

—Susan R. Bailey, MD, president (2020–2021), AMA

Suicide among physicians

Physicians are at a higher risk of suicide and suicidal ideation than the general population. Suicidal ideation has been associated with high workload volume and medical errors. Although previous research linked physician burnout to depression and suicide, a recent investigation suggests that burnout and depression are separate experiences, with distinct consequences for physicians and their patients. Physicians who experience suicidal ideation have been shown to be less likely to seek the help they need.

Factors associated with suicide among physicians include:

- Depression
- Emotional exhaustion
- Substance-use disorder
- Impaired relationships
- Self-destructive tendency

Efforts to understand physician suicide

American Medical Association policy commits the AMA to study suicide rates among physicians, residents, and medical students (AMA Policy D-345.983) to provide an accurate representation and understanding of the incidence rate. The AMA is working with research partners at Stanford Medicine’s WellMD Center to conduct this research and plans to use data from the National Death Index to capture a retrospective view. Understanding the incidence of suicide among physicians, residents and medical students will help inform the AMA’s continued efforts to promote access to mental health care, improve physician professional satisfaction and well-being, and reduce suicide risk for our nation’s health care workforce.
Identifying and addressing warning signs and risk factors

Taking proactive steps to identify and address physician distress can help to ensure the well-being of colleagues and reduce the risk of suicidal ideation. Additionally, it is imperative that physicians recognize the importance of self-care, model wellness behaviors, and encourage others to do the same.

Organizations should also note the importance of creating a supportive atmosphere in the workplace, which can be instrumental in addressing physician distress. Physician advocates can be valuable assets to an organization by providing support services to those in need of help. Additionally, referral lists for confidential resources inside and outside of the organization should be updated regularly and available to all team members, including physicians.

AMA efforts and resources to prioritize well-being and mental health

The AMA has joined the American Nurses Foundation, the American Hospital Association and the Schwartz Center for Compassionate Healthcare for the “All In: WellBeing First for Healthcare” campaign. The campaign is a call to action from #FirstRespondersFirst and the Dr. Lorna Breen Heroes’ Foundation to prioritize frontline worker well-being and mental health.

The AMA’s STEPS Forward™ practice innovation toolkits provide resources to help identify and support at-risk physicians, identify and respond to suicide risk, and respond compassionately and effectively on the organizational level after suicide occurs.
