

# RSV Immunizations

RSV immunization recommendations vary by age, comorbidities and time of the year. This infographic helps busy clinicians make the best recommendations for their patients.

-  **Adults 50-74 years old at high risk and everyone  $\geq 75$  years old:**  
Any time, but best between late summer and mid-fall. This is a one-time vaccine and need not be repeated.
-  **Pregnant patients 32-36 weeks gestation:**  
September through January. Pregnant patients should get only 1 vaccine; with subsequent pregnancies, newborns should receive a monoclonal antibody.
-  **Infants born to non-immune mothers and those 8-19 months at high risk:** October through March.
